5998 Leaves subcordate pubescent

5999 Leaves ovate-lanc. entire 3-nerved rough, Fl. terminal subcorymbose
6000 Leaves 3-nerved entire sessile ovate acute villous silky, Racemes brachiate, Stems square
6001 Leaves 3-nerved without a marginal one entire smooth on each side thin, Racemes term. Fls. sessile
6002 Leaves entire 3-nerved ovate-lanc smooth, Margin and nerves hispid beneath, Fl. terminal
6003 Leaves entire 3-nerved oblong emarginate at base, Raceme erect term. Fl. tetrandrous
6004 Leaves toothletted 5-nerved ovate-lanceolate, Stem hispid
6005 Leaves ovate acuminate toothletted 5-nerved, Cymes axillary
6006 Leaves cordate acumin. 5-nerved serrulate pubescent, Cymes terminal, Sepals roundish, Stamens 5 sterile
6007 Leaves cordate subcrenate beneath rusty with down, Flowers axillary and lateral solitary sessile
6008 Leaves ovate lanceolate acuminate 5-nerved pilose somewhat toothletted, Branches bifid, Panic. term.
6009 Leaves entire 5-nerved subcordate scabrous, Cor. little hairy outside
6010 Leaves entire 5-nerved lanceolate ovate rough
6011 Leaves 7-nerved ovate subcordate acuminate ciliated with teeth, Corymb terminal, Flowers 1-sided
6012 Leaves 3-nerved without ribs ovate-lanceol. acuminate toothletted, Corymbs term. trichotomous powdery
6013 Leaves 5-nerved obl. lanceol. acute entire hoary beneath, Pedunc. umbelled, Bractes double

6014 Leaves 5-nerved entire ovate acute smooth above beneath hoary, Flowers clustered sessile
6015 Leaves entire 5-nerved ovate-oblong smoothish acuminate smooth at edge
6016 Leaves 5-nerved nearly entire oblong acummate smooth beneath yellowish, Racemes cymose
6017 Leaves lanceolate ciliated 3-nerved obtuse at base, Stems square, Flowers terminal solitary
6018 Leaves cordate oval entire stalked beneath woolly, Petals obcordate, Petals bowed at base
6019 Branches winged, Leaves oval-lanceol. with a long point, Petals obovate pointed, Filam. woolly above
6020 Leaves oblong elliptical 3-nerved ciliated, Calyx setose at end
6021 Stamens 12, Leaves ovate-lanceolate 5-nerved, Stems and globose ovaries very hispid

6022 Peduncles solitary 1-flowered

6023 Leaves 3-nerved ovate crenate opposite

6024 Leaves obovate obtuse, Flowers 5-cleft decandrous

6025 Spikes elongated, Leaves wedge-shaped smooth

6026 Flowers octandrous, Leaves cordate smooth
6027 Flowers dodecandrous, Leaves ovate downy beneath
6028 Flowers 12-androus, Leaves ovate oblong serrulate
6029 Flowers 12-androus clustered, Leaves oblong obtuse serrated pubescent on each side

DIGYNIA.

6030 Leaves ovate roughish
6031 Leaves cordate oblong downy beneath
6032 Leaves oblong obovate obtuse smooth
6033 Leaves lanceolate smooth
6034 Leaves obovate lanceolate pubescent
6035 Leaves oblong lanceolate very villous
6036 Leaves lanceolate acute hairy beneath
6037 Leaves obovate villous coriaceous, Fl. stalked polyandrous polygynous
6038 Leaves elliptical, Flowers polyandrous polygynous

and Miscellaneous Particulars.

1032. *Dais.* A name of unknown application. The plant resembles in its leaves the Rhus cotinus, whence its specific name. It may be increased by cuttings of the roots placed in a warm situation.

1033. *Bucida.* From βυς, an ox. The form of the fruit when ripe resembles the horn of such an animal. This tree grows in Jamaica in low swampy lands near the coast; it is remarkable for its slender crooked branches, and the tufted disposition of the leaves: it grows to a considerable size, is reckened an excellent timber tree, and the bark is greatly esteemed by the tanners.

Well ripened cuttings root in sand, plunged in heat, and covered.

1034. *Samyda.* Σαμυδα is the Greek name of the birch, to which this genus may be likened in its leaves. The species are rather tardy in growth, but not difficult to root in sand under a hand-glass.

1035. *Royena.* So named by Linnæus, in honor of Adrian Van Royen, who with his son David were successively professors of botany at Leyden. It consists of shrubs of little beauty, which are increased by ripened cuttings in sand under a hand glass. They are chiefly natives of the Cape of Good Hope.

History, Use, Propagation, Culture,

1036. *Trianthema.* From τρεις, three, and ανθος, flower; the flowers growing by threes in the axillæ of the leaves. The species are weeds in their native countries, and of little interest here.

1037. *Scleranthus.* From σκληρος, hard, and ανθος, a flower; when in seed the envelopes of the flower appear very much indurated. S. annuus is common throughout Europe and Siberia on a sandy soil. It flowers about the middle of summer, and sows its seeds very abundantly in autumn, which produce a crop of young plants that generally survive the winter, or, if destroyed, are replaced by another crop arising from those seeds that happen not to vegetate till spring. (*Eng. Bot.*) The Swedes and Germans receive the vapour arising from a decoction of it into their mouths, to cure the tooth-ache. (*Withering.*)

S. perennis in several parts of Europe has its roots attacked by the insect Coccus Polonicus, *Lin.* which yields a fine crimson dye, and is said likewise to live on S. annuus and some Potentillæ. Sir J. Smith has "never been able to find this insect on these plants in England." (*Flora Brit.* ii. 283.)

These two species are occasionally found in abundance upon barren heathy wastes.

1038. *Cunonia.* In memory of John Christian Cuno, of Amsterdam, who described his own garden in Dutch verse in 1750. This is a handsome tree, with fine shining green foliage, contrasted by numerous dense elongated branches of small milk-white flowers, and twigs of a red color: having the habit of a tropical rather than of a Cape plant. Its colonial name is *Rood Elze* (red alder), although the tree has not in any point of view the least resemblance to the alder of Europe.

1039. *Hydrangea.* From ὑδωρ, water, and αγγειον, a vessel. The common garden species, H. hortensis, is quite a marsh plant, and to be managed well should have a very copious supply of water in summer. A large plant will consume ten or twelve gallons daily, in warm weather.

H. quercifolia is an elegant plant when in leaf; but as it is barely within the limits of ligneous plants, it dies down to the ground on the approach of frost. H. hortensis is much valued on account of the great profusion of its very elegant flowers, which are monstrous in the same manner as the Viburnum opulus. It has never

6039 Flowers pentandrous monogynous
6040 Flowers about decandrous digynous

6041 Calyx of fruit spreading
6042 Calyx of fruit closed

6043 The only certain species

6044 Cymes naked, Leaves oblong ovate acuminate toothed smooth
6045 Cymes radiate, Leaves cordate toothed
6046 Leaves ovate acuminate toothed beneath white with down, Serratures mucronate

6047 Cymes radiate, Leaves oblong sinuate-lobed toothed
6048 Cymes radiate, Leaves elliptical narrowed at each end toothed smooth

6049 Leaves alternate
6050 Leaves opposite roundish hairy, Stems decumbent

6051 Leaves orbiculate or oval stalked pimpled ciliate cordate at base, Petals round, Sepals mucronate
6052 Leaves oval retuse obsoletely serrated stalked, Stem naked, Panicle bearded
6053 Leaves cordate orbicular serrated stalked, Panicle headed
6054 Leaves radical ligulate with cartilaginous teeth, Stem panicled leafy, Cal. hairy with glands
6055 Radical leaves rosed straight glaucous supine crenate, Panicle simple
6056 Leaves radical lingulate with cartilag. teeth, Stem simple racemose leafy, Cal. smooth
6057 Radical leaves aggreg. lanc. obov. with cartilaginous teeth, Stem leafy clammy, Calyxes glandular
6058 Leaves rad. lingulate with a cartilaginous repand edge, Stem racemose leafy, Cal. with gland. hairs
6059 Leaves obl. lanc. hairy toothletted, Stem naked, Peduncles alternate in corymbose heads
6060 Leaves obl. lanc. smooth repand toothed, Stem naked, Peduncles 1-flowered aggregate
6061 Smoothish, Leaves oblong-lanc. acute eroded, Stem naked, Panicle oblong
6062 Leaves roundish toothed with long stalks, Stem naked
6063 Leaves obovate retuse with cartilaginous crenæ, Stem naked panicled
6064 Leaves cordate oval retuse with cartilaginous crenæ, Stem naked panicled
6065 Leaves reniform toothed, Stem naked panicled
6066 Leaves cuneiform very obtuse repand, Stem naked panicled
6067 Very hairy, Lvs. elongate spatulate acutely toothed, Stems divaricate dichotomous, Panic. capillary lax
6068 Leaves roundish toothed hairy, Runners creeping, Two petals long
6069 Leaves rhomboid toothed variegated hairy, Runners very weak, Petals nearly equal
6070 Leaves cuneate obovate somewhat toothed shorter than stalk, Stem panicled
6071 Leaves roundish cuneate crenate in front, Stem naked simple, Flowers clustered racemose

and Miscellaneous Particulars.

been found in a wild state, but is extensively cultivated in the gardens of China and Japan, from whence it was introduced to Kew by Sir Joseph Banks. The flowers are almost always barren; they are naturally of a rose color, but under certain circumstances of culture they become blue. The yellow loam of Hampstead Heath and some other places, and some sorts of peat earth are found to produce this effect; but the cause is not yet ascertained. Dr. Daalen, of Antwerp, finds that turf-ashes, and, still more effectually, those of the Norway spruce, the wood generally used as fuel by him, applied to the roots of Hydrangea, produced the blue color of the petals. (*Neil's Hort. Journ.* 122.) According to Busch, of Petersburgh, "the hydrangea will be turned blue by watering the young plant, the summer before, with alum water. Our grey colored earth, under the black moor-earth, has the same effect, being combined with aluminous salt." (*Hort. Trans.* vol. iv. 568.) Sweet recommends a bed of peat, and says, the longer it remains there the bluer will be the flowers.

The hydrangea, to flower freely, must not be allowed more than three or four strong shoots from the same root; it must have abundance of pot room, and plenty of water when in flower. It is a good plan to shift the plants twice or oftener during the early part of the season. If plunged and turned out of the pot into an open border in the end of May, they will flower vigorously, and will even stand the winter around and south of London, and flower yearly, and if well protected in winter very freely and strongly. The flowers are produced from the extremities of the shoots of the current year.

1040. *Chrysosplenium.* From χρυσος, gold, and σπλην, the spleen; a figurative name applied to this plant, with reference to its medicinal qualities. It is said to be a powerful cathartic. In the Vosges the plants are used copiously as a salad, under the name of *Cresson de Roche.*

1041. *Saxifraga. Saxum-frango*, to break the stone; a name contrived in reference to supposed medicinal qualities which are now forgotten.

An elegant genus of alpine plants, which have long been favorites in gardens. Many of the species are

History, Use, Propagation, Culture,

quite easy to cultivate, and although naturally mountaineers, not incapable of breathing the more impure air of towns and vallies. The greater part known are delicate and difficult to rear: they are regardless of cold, but suffer from mild and humid weather during the winter months. Most of the species are perennial, with either fibrous or granular roots, and a few are annual. Of the latter one species, S. tridactylites, is common upon very old walls in England, flowering in the beginning of the spring. The parts of fructification are extremely variable in this genus, and have given rise to the construction of many supposed genera, the constituents of which have the recommendation of agreeing with one another pretty well in habit. The limits, however, of these genera are too obscure, and the gradations by which they are united so obvious, that they have not yet been adopted by men of science generally. Without interfering with that question, the old mode of considering Saxifrage has been here adhered to, as being the most popular and the best under-

6072 Leaves obovate crenate subsessile, Stem naked, Flowers headed
6073 Leaves serrate, Stem naked branched, Petals acuminate
6074 Leaves lanc. mucronate with a cartilaginous ciliated edge, Stem naked few-fl. Cal. obtuse
6075 Leaves linear perforated dotted aggregate recurved, Stem many-fl.
6076 Leaves lanc. obtuse hairy, Stem naked 2-flowered
6077 Leaves ovate opposite imbricated: the upper ciliated
6078 Cauline leaves lanc. alternate ciliated, Stems procumbent
6079 Cauline leaves lanc. alternate naked unarmed, Stem erect
6080 Cauline leaves lin. subul. scattered naked unarmed, Stem decumbent
6081 Cauline leaves linear alternate ciliated: radical aggregate
6082 Cauline leaves reniform toothed stalked, Stem panicled
6083 Cauline leaves reniform lobed, Stem branched, Root granular

6084 Cauline leaves palmate stalked, Stem very simple 1-fl. bulbiferous
6085 Cauline leaves palmate: the upper floral ovate, Stem simple about 2-flowered
6086 Cauline leaves ovate lobed, Stem filiform weak
6087 Leaves cuneiform 3-parted with trifid linear segments, Stem simple ascending, Petals lanceolate
6088 Radical leaves reniform 5-lobed many-cleft, Cauline linear, Stem nearly naked branched
6089 Rad. lvs. reniform pedatifid 7-lobed, Caul. palmate and lin. Stem nearly naked branched, Pet. lin. obov.
6090 Smooth, Radical leaves 3-lobed, Lobes many-cut; lateral segments falcate, Stem panicled, Cal. colored
6091 Radic. leaves palm. 5-parted, Cauline linear undivided, Stems ascending many-fl.
6092 Leaves hairy trifid or 5-fid bearded, Runners procumbent, Stem leafy, Petals obovate rounded
6093 Leaves reniform palm. hairy, Stem and flower-stalks filiform
6094 Caul. leaves wedge-shaped trifid alternate, Stem erect branched
6095 Leaves wedge-shaped, Radic. entire and 3-toothed, Cauline 5-toothed; upper trifid, Pedunc. about 3-fl.
6096 Leaves palmate 3-parted, Segments subtrifid, Stem branched ascending
6097 Leaves cuneiform palmate 5-fid ciliated longer than the linear petiole, Runners very short tufted
6098 Leaves hairy 3 or 5-parted, Lobes elliptical acute, Runners ascending, Petals obovate 3-nerved
6099 Leaves hairy palmate 5-cleft and trifid, Stem leafy panicled, Petals roundish
6100 Leaves ciliated cuneate trifid nearly 5-cleft, Pedunc. solitary elongate 1-fl.
6101 Cauline leaves lin. entire and trifid, Runners procumbent, Stem erect nearly naked
6102 Radic. leaves aggregate entire and trifid acute linear, Stem viscid nearly racemose, Petals length of cal.
6103 Radic. leaves aggregate membranous lin. lanceolate entire or trifid, Stem nearly naked about 2-fl.

6104 Radic. leaves aggr. linear obtuse trifid cut, Stem erect many-fl. Petals twice as long as cal.
6105 Leaves imbric. cuneate-palmate ciliated, Petals round, Styles spreading, Stigmas flat woolly
6106 Radical leaves aggregate entire and trifid oblong obtuse, Stem filiform about 2-fl, Pet. as long as calyx

6107 Leaves cordate acutely lobed toothed, Scape racemose
6108 Leaves ovate cordate acute shortly lobed toothed, Raceme filiform spiked
6109 Leaves biternate

6110 Leaves cordate about 3-lobed toothed, Scape 2-leaved
6111 Leaves orbiculate reniform doubly crenate lucid, Scape setaceous lucid
6112 Leaves reniform repand ciliated, Scape naked

1. *Calyxes not scaly.*

6113 Flowers clustered, Stems simple roughish, Leaves linear fleshy
6114 Flowers corymbose, Stem ascending, Leaves lanc. lin. obsoletely 3-cornered obt. 1-sided, Stam. exserted
6115 Flowers corymbose, Petals rarely subemarginate, Leaves linear fleshy smooth flat
6116 Flowers corymbose, Branches divaricating, Leaves ovate lanc. smooth at the base cordate amplexicaul.
6117 Branches spreading, Flowers panicled small, Pan. much branched, Fl.-stalks viscid
6118 Flowers panicled, Panic. much branched polished, Leaves ovate lanc. half stem-clasping
6119 Fl. trichotomous panicled, Pedunc. villous viscid, Petals emarginate twice as long as calyx
6120 Fl. panicled very minute dicœcious, Peduncles smooth filiform divaricating, Leaves lin. lanc. rough
6121 Fl. panicled, Panic. divaricating, Branches few-flowered pubescent viscid, Leaves lin. lanc. obtuse
6122 Fl. dichotomous, Panic. smooth, Pet. emarg. twice as long as cal. Leaves lanceolate fleshy

and Miscellaneous Particulars.

stood. The species are subject to great variation in appearance, and to much diversity of opinion among those who profess to be best acquainted with them. A middle course has here been taken, by which the doubtful kinds have been omitted, and those which are recognized, if not defined, satisfactorily, are alone admitted.

1042. *Tiarella.* From *tiara*, a particular kind of head-dress, a mitre, in allusion to the form of its capsule. Pretty little North American herbaceous plants, related to saxifrage, and easily cultivated in pots of light sandy peat and loam.

1043. *Mitella.* A diminutive of *mitra*, a mitre; so named for the same reason as the last genus, which it altogether resembles in habit and constitution.

1044. *Gypsophila.* From γυψος, chalk, and φιλεω, to love; most of the species delight in chalky districts.

History, Use, Propagation, Culture,

Some of the species are fine border plants, but the greater part are of little beauty, and only grown in botanic gardens.

1045. *Saponaria.* In allusion to its mucilaginous sap, which is said to be fit for supplying the place of soap, *sapo.* S. officinalis plena is considered a border flower, but is inconvenient unless kept in pots, from its spreading very much by the roots, which are underground creepers, like those of couch. The leaves form a lather with soap, and take out spots of grease in the same manner. The whole plant is bitter, and was formerly used to cure the itch and the venereal disease.

1046. *Dianthus.* Διος ανθος, the flower of God, or divine flower; so named on account of its pre-eminent beauty. Most of the species of this genus are highly valued, not only for the beauty of their flowers, but also as being evergreens; their foliage during winter being as abundant and vivid as in summer. The fragrance of some of the species is peculiarly grateful, and no plant in this respect surpasses the carnation. D. barbatus is an old inhabitant of the flower garden, and was much esteemed in Gerarde's time "for its beauty to deck up the bosoms of the beautiful, and garlands and crowns for pleasure." The varieties are numerous, but as the plant has never been treated by florists as a leading flower, they have not been named or improved. A hybrid variety called the Mule, or Fairchild's Sweet-William, is supposed to have been produced from seeds of the

6123 Fl. panic. Stem diffuse, Leaves lin. lanc. grassy carinate cæsious
6124 Stems panic. few-fl. Stam. shorter than emarginate petals, Leaves linear smooth
6125 Petals obovate emarginate campan. Stamens shorter than corolla, Leaves linear somewhat fleshy
6126 Stems panicled, Styles longer than emarginate petals, Leaves lin. lanc. smooth
6127 Stem dichotomous panicled much branched, Fl. axill. solitary, Leaves lin. flat as long as fl.-stalks

2. Calyxes supported by 2-4 scarious scales.

6128 Stems numerous erect stiff, Fl. panicled terminal, Leaves linear rigid

6129 Flowers fascicled panicled, Cal. rounded villous yellowish, Leaves ovate lanc. acute or not

6130 Fl. panicled, Cal. pyramid. 5-ang. smooth, Bractes membranous acute, Leaves ovate lanc. sessile
6131 Stem erect, Branches divaric. with clammy hairs, Fl. on long stalks axill. Leaves lanc. linear
6132 Stems erect branched, Fl. panic. and corymbose, Cal. slender glandular purple, Lvs. ovate lanc. 1-nerved
6133 Stem dichotomous, Branches divaricating, Fl. axill. Cal. hispid round, Leaves linear spatulate
6134 Tufted, Stems 2-leaved, Flowers headed with an involucre, Cal. woolly

§ 1. *Flowers capitate or corymbose, sessile or stalked.*

* *Bractes ovate, blunt.*

6135 Scales of calyx ovate pointless longer than tube, Leaves serrulate
6136 Like the last, but the flowers nearly solitary

** *Bractes lanceolate, acute, Calyxes villous.*

6137 Flowers loosely bundled, Scales lanc. subul. as long as tube, Leaves subulate, Calyxes hairy
6138 Flowers densely bundled, Scales ovate subul. as long as tube, Pet. beard. Lvs. subul. pub. rough upright
6139 Fls. aggreg. Scales long. than cal. striat. rough, Lvs. lin. short. than joints rough, Stem simple rough upw.

*** *Bractes ovate or lanceolate, Calyxes smooth.*

6140 Flowers aggregate fascicled, Scales ovate subulate as long as tube, Leaves lanceolate
6141 Flowers aggregate racemose corymbose, Scales ovate lanceolate finally longer than calyx, Lvs. obl. lanc.
6142 Flowers aggregate fascicled, Scales acute ciliated twice as short as tube, Leaves ovate short
6143 Fls. subsess. capitate, Scales imbric. mucron. at end spreading a little short. than tube, Lvs. long narrow
6144 Glaucous, Fls. sess. capitate, Scales broad ovate with a long awn longer than head, Upper lvs. dilat. at base
6145 Dark green, Flowers sessile capitate, Scales ovate very short pointless, Leaves narrow rough
β Flowers panicled fastigiate and solitary stalked
6146 Fl. aggregate, Involucres and scales scarious rufous oblong awned a little shorter than cal.
6147 Fl. aggregate sessile and stalked, Scales ovate awned shorter than tube, Leaves linear 3-nerved
6148 Like the last, but flowers aggregate headed sessile 3-8
6149 Flowers aggregate, Claws of petals very long, Scales mucronulate closely imbricated, Leaves subul. fleshy
6150 Flowers aggregate, Claws of pet. as long as cal. Scales mucr. closely imbric. very short, Leaves lanc. obt.
6151 Flowers aggregate, Scales ovate subulate thrice as short as tube, Leaves lin. lanc. narrowed at each end
6152 Flowers aggregate on long stalks, Scales twice as short as tube

§ 2. *Flowers panicled or solitary.*

* *Petals toothed.*

6153 Flowers fascicled, Scales ovate lanceolate shorter than tube, Petals acutely toothed, Lvs. lin. lanc. rough
6154 Like the last, but the flowers more numerous, and the leaves linear lanc.
6155 Stem panicled somewhat hairy, Fl. sol. Scales ovate acute twice as short as cal. Leaves subul.
6156 Flowers fascicled twin, Scales awned as long as calyx, Petals crenate, Stem decumbent, Lvs. anc. obt.
6157 Flowers somewhat corymbose, Scales furrowed mucron. twice as short as tube, Stems diffuse smoothish
6158 Flowers nearly sol. Scales 6 ovate mucron. much shorter than cal. Pet. crenate, Lvs. subul. rough at edge
6159 Stem panicled smooth, Flowers solitary, Scales ovate awned as long as tube, Leaves subulate nerved
6160 Stem many-fl. smooth, Scales cuspid. spreading shorter than tube, Pet. downy at orifice, Lvs. lin. roughish
6161 Stem panicled, Fl. sol. Scales acuminate appressed, Petals acutely toothed, Leaves subul. lanc.
6162 Stem branched, Fl. sol. Scales linear leafy, Petals toothed, Leaves lin. lanc.

and Miscellaneous Particulars.

carnation impregnated by a Sweet-William. D. caryophyllus is considered the source whence have sprung the numerous varieties of the carnation, and some think those also of the pink. The pink, however, is more probably derived from some of the smaller growing species, as plumarius, deltoides, armeria, carthusianorum, &c.

The carnation is rarely found wild in England, but it may be gathered on the south side of the Swiss Alps. It seems to have been unknown to the ancients, at least in its cultivated state, not being mentioned by Pliny, or sung by any of the Roman poets. It has, however, been cultivated from time immemorial in Europe, and is in the highest favor for its beauty and rich spicy odour. It is the principal florist's flower of Germany and Italy, from which countries the British florists procure their best carnation seed, and also some esteemed varieties.

The varieties of carnation amounted to nearly 400 named sorts in the beginning of the eighteenth century, and the number has not since diminished. They are arranged in three classes; flakes, bizarres, and picotees. Flakes have two colors only, and their stripes large, going quite through the leaves; *bizarres*, Fr. (odd, irregular) are variegated in irregular spots and stripes, and with no less than three colours; *picotees*, Fr. (*piquettée*, pricked or spotted) have a white ground, spotted or pounced with scarlet, red, purple, or other colors. Of

History, Use, Propagation, Culture,

each class there are numerous varieties, arranged under the farther subdivisions of scarlet flake, pink flake, purple flake, yellow flake, &c.; scarlet bizarre, crimson bizarre, &c.; and purple picotee, yellow picotee, &c.

Picotees are rather smaller flowers than carnations, and are distinguished by the serrated margins of their petals; the colors are principally yellow and white spotted, and the plants are considered hardier than the other sorts. Whatever colors the flower may be possessed of, they should be perfectly distinct, and disposed in long regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the unguis, or base of the petal, there terminating in a fine point. Each petal should have a due proportion of white, *i. e.* one half, or nearly so, which should be perfectly clear and free from spots. Bizarres, or such as contain two colors upon a white ground, are esteemed rather preferable to flakes, which have but one, especially when their colors are remarkably rich, and very regularly distributed. Scarlet, purple, and pink are the three colors most predominant in the carnation; the two first are seldom to be met with in the same flower, but the two last are very frequently.

New varieties are procured from seeds, and thousands of seedlings are annually blown by florists and amateurs, sometimes without one being found worth keeping. Established or approved varieties are continued by layering and cuttings, or, as they are commonly called, pipings. The soil in which the carnation thrives best is a rich loam rather sandy than otherwise; the climate should be free from extremes of every kind, for which reason they are commonly grown in pots, and protected by a frame during winter, and covered by an awning while in bloom. Carnations grow exceedingly well in beds of properly prepared soil, over which frames are placed in winter, and an awning of canvass or bunting when the plants are in blossom. Those who are curious in blowing their carnations have a great many nice and curious operations to perform when they come into flower. Such petals as are plain, or run from the proper colors of the variety, are extracted by a particular instrument; the remaining petals are next arranged so as to form a convex imbricated surface; the calyx being slit down or tied up as may be necessary to aid this end. Then the flowerstalks are neatly tied to sticks, and the flower supported in a pendant attitude by means of properly formed brass wires.

6163 Stem branch. upw, closely dichotom. Fl. sol. Bract. with a spread. leafy point, Lvs. lin. subul. 3-nerv. hairy
6164 Stem branched, Fl. sol. Scales very short ovate, Petals very broad beardless, Lvs. lin. sub. channelled glauc.

6165 Stem branched or simple, Fl. sol. Scales very short 4 ovate, Pet. broad beardless toothed

6166 Stem dichotomous panicled many-fl. glaucous, Fl. sol. Scales 4 pungent spreading shorter than tube

6167 Fl. sol. subcorymb. Scales ov. lanc. short. than tube, Lvs. lin. lanc. obsol. 3-nerv. smooth, Pet. twice toothed
6168 Fl. sol. Scales ovate acute very short, Petals emarginate or nearly entire
6169 Stem branched, Fl. sol. Scales ovate acute very short awned, Pet. lanc. narrow, Leaves subul. roughish
6170 Stem few-fl. Fl. sol. Scales very short mucron. spreading, Tube gibbous, Pet. entire, Lvs. cæspitose subul.
6171 Stem decumb. branched, Fl. sol. Scales ovate lanc. acute twin, Upper leaves narr. acute : lower oblong obt.
6172 Like the last, but flowers white, Leaves and stem glaucous
6173 Stem branched, Fl. sol. Scales 6 lanc. appressed, Pet. smooth cuneate obovate, Lvs. lin. acum. channelled
6174 Stems tufted few-fl. Fl. sol. Scales ovate acute short, Leaves subul. spreading downy rough
6175 Stem 1-fl. Scales 2 ovate acute short spreading, Cal. contracted in middle, Lvs. lin. chann. roughish at edge
6176 Stem 1-fl. Scales 4 acute short, Petals bearded doubly serrated, Leaves lin. spreading
6177 Stems tufted about 1-fl. Scales roundish short, Pet. crenate downy, Leaves bluntish rough at edge
6178 Stem 1-fl. Outer scales as long as tube : inner much shorter, Pet. crenate, Leaves obl. obtuse
6179 Pedunc. bifid term. Scales lanc. cusp. erect short. than tube, Pet. cut, Lvs. lin. nerved serrul. rough at edge
6180 Stems about 2-fl. Scales 4 ovate acute twice as short as tube, Petals serrate downy, Leaves linear
6181 Stem about 1-fl. Scales obovate mucronate, Pet. beardless many-cut, Leaves subul. entire smooth nerved

*** Petals fringed.*

6182 Stems ascending about 1-fl. Scales short ovate, Pet. toothed many-cut, Leaves lin. ciliated
6183 Fl. sol. Scales 4 lanc. short, Petals emarginate at the end fringed toothed
6184 Glaucous, Stems 2-3-fl. Teeth blunt, Bractes ovate very short pointed, Leaves lin. rough at edge
6185 Like the last, but the petals bearded at their orifice
6186 Stem pan. few-fl. Fl. sol. Scales ovate acum. Petals equally cut crenate, Leaves glaucous rough at edge
6187 Stems 1-fl. Scales ovate lanceolate acuminate shorter than tube, Pet. beardless, Lvs. subul. rough at edge
6188 Stem branched few-fl. Scales 4 blunt short, Petals beardless dotted, Leaves glaucous linear flaccid
6189 Stems 1-fl. Scales ovate obtuse four times as short as calyxes, Pet. naked, Leaves subul. glauc. ciliated
6190 Stems 1-fl. Scales ovate obtuse, Leaves linear
6191 Stem half-shrubby branched at base 2-fl. Scales 6 lanc. shorter than cal. Leaves subul. rough

6192 Fl. scattered solitary, Scales lanc. lin. spreading a little shorter than tube, Leaves lin. nerved flaccid
6193 Stem panicled few-fl. Fl. sol. Scales subul. straight twice as short as tube, Petals digitate, Lvs. lin. serrul.
6194 Stem panic. many-fl. Fl. fastigiate, Scales short ov. mucron. Pet. beyond the middle pinn. many-cut hairy [at orifice

TRIGYNIA.

6195 Branches divaricating, Leaves ovate, Cal. campanulate, Pet. distant

and Miscellaneous Particulars.

Behind the petals a circle of card paper is sometimes fixed to keep them in position, and the pot in which the plant grows is placed on a particular description of saucer, by which it is surrounded by water, in order to prevent the approach of ground insects, and especially of the earwig. These and a number of other operations will be found described at length in Maddock's Florist's Directory, and in the Encyclopædia of Gardening. (Sec. 6406.)

The pink, as a florist's flower, is of much less antiquity than the carnation : it is scarcely mentioned by Gerarde, and Parkinson has given very few varieties. It was chiefly grown as a border flower till within the last fifty years, since which it has been greatly improved and many fine varieties originated. Being one of the hardiest and least expensive of fine flowers, it is much cultivated by operative mechanics and manufacturers round large towns, and no where to such an extent as about Paisley, by the muslin weavers there.

The varieties of pink most cultivated are chiefly those called pheasant's eyes, which seem to have sprung from D. plumarius. Cob pinks are a large sort seemingly intermediate between pinks and picotee carnations; red early pinks are smaller plants than cobs, but larger than pheasant's eyes, and seem to have sprung from cobs and D. armerius or deltoides. The Paisley growers reckon above three hundred varieties of the pheasant's eyes. To garden pinks in general Wildenow gives the appellation of D. hortensis.

The propagation and culture of the pink is the same as that of the carnation, excepting that it is less frequently kept in pots or frames, but planted in beds of fresh loamy soil, and the small side shoots reduced in the autumn in order to throw more strength into those intended to produce flowers the following season. Some cover their pink bed with an awning. Not more than eight or ten flowers are ever allowed to expand on one plant, and these, if they shew a tendency to bursting at the calyx, are to be tied as in carnation culture.

1047. *Cucubalus.* A name signifying a bad subject; an evil weed. According to Miller, the berries of this plant are no less deadly than those of Nightshade.

1048. SILE'NE. *L.* Catchfly. *Caryophylleæ. Sp.* 107—217.

History, Use, Propagation, Culture,

1048. *Silene.* A poetical name, after the God Silenus, who is represented as always drunk and covered with slaver, as the species of this genus usually are with a viscid secretion. This is a large family of small plants, neither remarkable for use, beauty, or as bad weeds. S. inflata, the Cucubalus Behen *L.*, may be used as a substitute for asparagus or green pease, the young shoots having the flavor of both. They ought to be gathered

§ 1. *Tufted, Stems scarcely any, Calyx sowewhat inflated, Peduncles 1-flowered.*

6196 Smooth, Stems dense, Leaves lin. lanc. Flowers dicecious, Calyx campanulate
6197 Stems less dense, Leaves lin. spatulate pubescent, Cal. inflated hairy

§ 2. *Caulescent, Flowers solitary or panicled, Calyx bladdery inflated.*

6198 Pubescent, Leaves large ovate-lanc. Fl. in large panicles, Cal. much inflated, Petals fringed
6199 Hispid, Leaves ovate-lanc. on long stalks wavy, Cal. much inflated, Pet. lacerated crowned
6200 Stems erect branched pubescent, Leaves 4 whorled lanc. with long points smooth, Fl. pan. Cal. bladdery
6201 Stems branched, Fl. pan. Cal. bladdery ovate, Pet. bifid naked, Styles very long
6202 Like the last, but hairy with ovate lanc. leaves
6203 Like the last, but creeping with smaller nearly spatulate leaves
6204 Smooth branch. Lvs. lanc. : the lower stalk. Fl. pan. Cal. ovate veiny, Pet. with 2 very short lobes crowned
6205 Pubescent, Stems very tall branch. Lvs. large lanc. Fl. pan. Cal. ov. netted, Pet. with a claw hairy at base
6206 Smooth, Stem erect simple rather leafy, Lvs. lin. scarcely ciliat. Fl. in pan. spikes, Claws of pet. not ciliated
6207 Smooth with very leafy branched procumbent stems, Leaves lanc. Fl. axill opp. and terminal, Petals bifid
6208 Nearly smooth, Stems little branched, Leaves obovate serrulate-ciliated, Fl. pan. Pet. obcordate crowned
6209 Hoary, Stem erect branched, Leaves lanc. : the upper linear, Fl. few term. Petals O
6210 Stems procumb. diffuse 2-3-chotomous branched, Lvs. small lin. Petals half-bifid with an obcord. crown
6211 Nearly smooth, Stems wavy branched leafy, Leaves lin. lanceolate, Petals 2-lobed
6212 Smooth, Stem erect, Leaves acute glaucous, Fl. solitary, Pet. lanceolate with a 2-lobed crown

§ 3. *Caulescent, Flowers spiked in whorls.* [Fl. small dicecious

6213 Leaves erect, with a few branches, which are scarcely pubesc. or leafy, Lower lvs. numerous spatul. fleshy,
6214 Stem pubesc. branched, Lower leaves large lanc. spatulate : upper lin. long, Fl. panicled with linear petals
6215 Hoary, Stems assurgent nearly simple, Leaves spatulate lanc. Cal. spherical 10-striped
6216 Stems erect nearly simple, Lvs. lin. : lower obt. Fl. very numerous and small, Cal. obov. clavate 10-striped
6217 Half-shrubby smooth, Stems much branch. Lvs. lin. lanc. shortly ciliat. numerous, Cal. infl. clav. 10-striped
6218 Stem simple, Lvs. lin. lanc. : lower broader stalk. Cal. clavate cylindr. 10-strip. Pet. 2-part. Stam. very long
6219 Smooth, Stems erect simple very leafy, Lvs. lanc. small, Spike dense, Cal. clavate netted, Stam. very long
6220 Velvety, Radical leaves cochleate smooth, Cal. tubular 10-striped, Pet. 2-fid, Stamens very long
6221 Pubescent very viscid, Stem simple thick leafy, Leaves large lin. lanc. wavy, Fl. large nodding

§ 4. *Caulescent, Calyx conoid, at the bottom retracted, with very long teeth.*

6222 Pubescent, Leaves linear soft, Cal. short conical
6223 Stems pubescent, Leaves lanc. lin. nearly smooth, Cal. long conical
6224 Pubescent, Leaves lanceolate wavy : the lower stalked, Fl. large in loose dichotomous panicles

§ 5. *Caulescent, Flowers spiked, axillary, not opposite, Calyx with* 10 *stripes.*

* *Calyx cylindrical.*

6225 Hairy, Stems branched, Leaves lanc. acute, Cal. ventricose with very long teeth, Petals small crowned
6226 Very hairy, Stems much branched, Lower leaves obovate spat. : upper lanc. obtuse, Petals undivided
6227 Stems branched, Leaves lin. lanc. Spike 1-sided, Cal. cylindrical with 10 ribs, Teeth long, Pet. 3-toothed
6228 Hairy, Stems branched, Lower lvs. spatulate : upper lanc. obtuse, Cal.-teeth short, Pet. obov. crowned
6229 Hairy, Stems branched, Leaves spatulate, Spike 1-sided few-fl. Cal. very hairy, Pet. obovate crowned
6230 Hairy, Stem much branched, Leaves lanc. cusp. Spikes twin dense, Pet. small bifid
6231 Stems simple vill. Leaves pub. : lower spatul. ; upper lanc. Spike 2-ranked few-fl. Pet. obov. retuse crowned
6232 Pubesc. Stems branch. Lvs. lanc. : lower obt. Spike 1-sid. Cal. vill. with short teeth, Pet. roundish crowned
6233 Stem branch. hairy below, Lvs. pubesc. with a long fringe at base, Cal. cyl. nearly smooth ribbed and netted
6234 Like the last, but flowers few distant, Petals smaller
6235 Hairy, Stem branched leafy, Leaves lin. lanc. Flowers terminal, Cal. cylindr. Pet. bifid
6236 Hairy, Fl. sessile 1-sided, Cal. cylindr. appressed, Petals small deeply emarginate

** *Calyx clavate.*

6237 Hoary, Stems prostrate branched, Lvs. obovate spatulate ciliated at base, Fl. 1-sided erect, Pet. bifid
6238 Stems branch. pubesc. Lvs. scabrous cil. at base : lower spatul. ; upper lanc. Fl. sess. nodding, Pet. 2-parted
6239 Pubescent, Lvs. somewhat fleshy : lower spatulate ; upper lanceolate, Cal. long clavate, Petals 2-fid
6240 Hairy, Stem erect slender branched, Lvs. lanc. Spikes twin 2-sided, Cal. cylindr. clavate, Pet. bifid
6241 Pubesc. Stems branch. Lvs. spatul. obt. Spikes twin 1-sided, Cal. bladdery, Pet. 2-parted with ov. lobes
6242 Velvety, Stem procum. branch. leafy, Lvs. ov. spatul. fleshy, Bract. very small, Pet. with long claws emarg.
6243 Smth. Stem erect slend. branch. Lvs. lin. scarcely ciliat. : low. ov. Fl. on long stks. Pet. 2-part. with lin. lobes
6244 Smooth, Stems usually simple, Lvs. somewhat fleshy lin. lanc. Cal. ov. ventric. Pet. bifid with 4-lob. append.
6245 Pubesc. Stems numerous prostrate very leafy at base, Lvs. lin. setaceous ciliated, Recesses of calyx deflexed
6246 Pubescent branched supine, Leaves ovate lanc. Fl. axillary pendulous, Petals bifid crowned

§ 6. *Caulescent, Stems upright, Peduncles filiform, Calyx campanulate or cylindrical.*

6247 Tufted, Stems erect slender branched, Lvs. small linear very narrow, Fl. small, Petals short 4-toothed
6248 Like the last, but the radical leaves broader, Peduncles long upright
6249 Root branched, Stems simple leafy, Lvs. lanc. lin. obt. Fl. large panicled, Petals broad 4-cleft, Seed ciliated
6250 Smooth, Stems erect branched, Leaves ovate lanc. Fl. panicled very small, Petals obcordate

and Miscellaneous Particulars.

when about two inches long, and the more they are blanched the better. Bryant (*Flora Dietetica*) says, its culture would well reward the gardener's trouble. S. viscosa is a popular border flower, especially the double variety.

S. quinquevulnera was formerly in culture as a border flower, but is now seldom used for that purpose :

History, Use, Propagation, Culture, being very low and prolific in flowers, it is well adapted for sowing in pots. S. Armeria is one of the annual border flowers of the seed shops.

1049. *Stellaria.* The parts of the flower are stellate. The species are grassy-looking plants of the easiest

6251 Smooth, Stems erect branched, Lvs. lanc. acute : lower obt. Petals not opening obcordate, Stam. usually 5
6252 Pubesc. Stem erect much branched slender, Lower lvs. obl. obt. : upper lanc. narrow, Pet. short erect bifid
6253 Nearly smooth, Stem erect branched somewhat leafy, Leaves lanc. acute ciliated, Fl. small panicled
6254 Pubescent, Stems branched, Lower leaves eliipt. spatulate : upper lanc. Fl. term. twin, Petals bifid
6255 Pubescent, Stems erect branch. straight, Low. lvs. lanc. spat. : up. linear, Fl. loosely panicled, Pet. 2-lobed
6256 Stems branched, Leaves lin. spatulate, Fl. term. Cal. cylindr. clavate, Petals 2-fid
6257 Smooth, Stems erect branched, Low. lvs. ov. stalked obt. : up. lin. acute, Fl. loosely panic. Cal ov. clavate
6258 Viscid pubesc. Stems erect much branch. Lvs. fleshy : low. spatul. ; up. ov. Fl. small, Pet. obcord. crowned
6259 Tufted, Stems assurgent, Lvs. lin. acute, Peduncles very long, Cal. long clavate, Petals 2-parted crowned
6260 Tufted shortly bristly, Stems assurgent, Leaves lin. with bristly teeth, Fl. small, Petals 2-fid crowned
6261 Smth. Stems erect or assurg. somew. branch. leafy at base, Lvs. lanc. lin. acute : low. spat. Pet. 2-part. naked

§ 7. *Caulescent, Flowers panicled, rarely solitary, Pedicels opposite short, Calyx tubular.*

* *Flowers nodding, Calyxes cylindrical.* [reflexed

6262 Smooth viscid, Stems erect, Lvs. somewhat fleshy lin.-lanc. fringed with fine bristles, Pet. very long 2-part.
6263 Pubesc. Stems leafy at base, Radical lvs. spatul. : upper lanc. lin. Pet. 2-parted reflexed with a long crown
6264 Like the last, but smooth, less branched, and less leafy, Leaves linear, Petals often green
6265 Like the last, but stems flexuose broken down, Petals white above beneath livid green
6266 Smooth, Leaves lin. lanc. ciliated at base, Fl. pan. erect, Cal. ventricose cylindr. Petals 2-parted
6267 Hairy soft, Stem branch. leafy, Lvs. large ov. acum. Fl. in large nodding panicles, Pet. with very long claws
6268 Smooth, Stems erect simple scarcely leafy, Petals 2 parted with filiform lobes [crowned

** *Flowers erect, Calyxes clavate.*

6269 Velvety glutinous upwards, Stem erect branched leafy, Fl. small loosely panicled, Stamens very long
6270 Stem short about 2-flowered pubescent, Radic. leaves lanc. lin. acute, Cauline very short, Pet. bifid
6271 Scarcely pubesc. Root long creeping, Stem erect almost simple, Lvs. lin. grassy acute, Fl. few erect panic.
6272 Viscid pubesc. Stem procumb. assurgent branch. Fl. large panic. Cal. large clavate, Pet. broad bifid crowned
6273 Scarcely pubesc. Stem upright branched, Lvs. lin. lanc. Fl. panicled erect, Cal. netted, Pet. small emarginate
6274 Smoothish viscid, Stem erect, Alternate branches long, Cal. large clavate netted, Petals bifid
6275 Visc. pubes. Stems erect branch. Lvs. large, Fl. large panic. : every other stripe of cal. veiny, Teeth very long
6276 Pubes. Stems erect branch. Lvs. lanc. obt. Fl. panic. : every other stripe of cal. veiny, Pet. with broad toothl.
6277 Subtomentose, Stems branch. Lvs. obov. stalked, Fl. term. erect, Pet. obcord. 2-toothed at base [lobes
6278 Silky, Stems branched, Lvs. with a long fringe at base, Fl. large term. Pet. 2-parted crowned
6279 Stems much branch. scarcely pubesc. Lower lvs. obov. spatul. Lvs. lin. acute, Cal. clavate striped with red
6280 Tufted smooth subviscid, Stems branched at base, Lvs. lin. Fl. panic. Cal. netted, Pet. bifid with lanc. lobes

*** *Flowers erect, Calyxes long clavate.* [at base

6281 Smooth visc. Stems branch. Lvs. lanc. lin. Cal. very long. clav. nett. Pet. obcord. with a tooth on each side
6282 Viscid pubescent, Stems procumbent, Leaves lin. long, Cal. long tubular, Petals slightly emarg. crenate
6283 Tufted viscid pubesc. Root woody, Stems low assurgent little branched, Cal. long netted, Petals bifid
6284 Suffruticose, Stems suberect smooth branched at base, Cal. long cylindr. viscid-villous, Petals 2-lobed
6285 Scabrous, Stems bran. Fl. term. in the dichotomies, Cal. long cylin. Pet. 2-part. tooth. on each side at base
6286 Pubescent, Root woody, Stems diffuse branched, Leaves soft numerous below, Petals half bifid
6287 Tufted viscid pubescent, Stems woody supine branched, Lvs. lin. acute, Petals with narrow diverging lobes
6288 Stems erect pub. Lvs. roughish scarcely ciliat. Fl. large pan. Pet. with broad obov. lobes & 2-part. append.
6289 Very smooth glaucous, Stems branched, Leaves roundish acuminate, Fl. large, Cal. not striped
6290 Pilose pubesc. Stems much branch. Lower lvs. ovate-spatul : up. lin. Fl. in large panic. Pet. 2-lob. naked
6291 Pubesc. visc. Stems erect branch. Branch. spread. Low. lvs. ov. spatul Cal. long narrow, Pet ½ bifid crowned
6292 Pubescent, Stems assurgent much branched leafy, Leaves linear acute, Cal. clavate, Petals bifid
6293 Stem simple pubescent, Leaves pubescent : lower large rounded stalked, Petals 2-parted crowned
6294 Smooth, Stem twiggy, Leaves lin. lanc. radical very long, Cal. very long, Petals 2-parted crowned
6295 Smooth clammy, Stem assurgent branch. Lvs. lin. lanc. acute : lower very long, Upper bractes with a broad
6296 Silky, Stems erect branch. Lvs. wavy, Calyxes long clavate, Pet. 2-part. crowned [membranous margin
6297 Viscid pubescent, Lvs. lanceol. Cal. long tubular, Petals lanceolate crowned, Stamens very long
6298 Villous viscid, Lvs. lin. lanceol. obt. ciliated, Peduncle 1-fl. spreading in seed, Cal. circularly reflexed at base

§ 8. *Caulescent, Flowers corymbose, Cal. clavate, 10-striped.*

6299 Tufted roughish, Root thick woody branch. Stems simple slender very leafy at base, Lvs. small lin. acute
6300 Viscid, Stem much branch. pubesc. Lvs. round subciliated : the lower on long stalks, Fl. loosely corymb.

6301 Very smooth glaucous viscid, Leaves ovate-lanc. Fl. in panicled corymbs, Petals obcordate crowned

6302 Smooth, Stems erect branched, Upper leaves lanceolate : lower linear lanc. Umbel dense, Petals obovate

6303 Lower leaves cordate stalked : upper lanc. sessile, Petals twice as long as calyx
6304 Stems diffuse dichotomous rooting at base, Lower lvs. ovate stalked cord. : upper sess. Pet. shorter than cal.
6305 Stems procumbent with a lateral 1-sided hairy line, Leaves lanc. very tender, Fruit deflexed

and Miscellaneous Particulars.

culture. S. media is a well known weed, never found but on rich friable soils in a state of culture : the seeds and flower buds are a favorite food of finches and other small birds.

History, Use, Propagation, Culture,

1050. *Arenaria.* From *arena*, sand, in which most of the species are found. They are of most difficult discrimination, and are chiefly diminutive weeds found almost exclusively on sandy soils. The flowers vary

6306 Hairy, Lvs. cord. ovate stem-clasping, Stem dichotomous, Fl. solitary, Sepals lanc. ac. longer than petals
6307 Leaves ovate lanceol. nearly veinless, Pedunc. 1-fl. Sepals lanc. acute twice as short as petals
6308 Villous viscid, Leaves lin. lanc. Stems dichotomous diffuse, Petals and capsule longer than calyx
6309 Lvs. lanc. acum. serrulate roughish : the upper broader and shorter, Pedunc. filiform very long, Pet. 2-fid
6310 Stem erect few-fl. Lvs. linear acute entire smoothish, Pedunc. filiform very long, Petals 2-parted
6311 Leaves linear smooth at edge, Stems diffuse, Fl. panicled divaricating, Petals the length of calyx
6312 Glaucous, Leaves lin. lanc. smooth at edge, Floral scarious, Petals twice as long as cal. Stem erect weak
6313 Leaves ovate-lanceol. entire smooth thick, Sepals ovate-lanceol. much shorter than petals
6314 Leaves ovate-obl. Pet. deeply divided shorter than calyx, Caps. ovate oblong longer than calyx
6315 Leaves obl. pubescent, Pedunc. 1-fl. twin, Pet. larger than cal. Caps. obl. nearly twice as long as sepals
6316 Leaves spatulate, Stem erect bifid viscid, Branches alternate, Petals emarginate
6317 Leaves linear lanc. obtuse very dense, Pedunc. 1-fl. and umbelled, Pet. scarcely longer than calyx
6318 Leaves lanc. entire sessile acute, Base and stem pubescent, Fl. axill. solitary
6319 Glandular pubescent, Stem procumbent, Leaves ovate fleshy, Petals scarcely longer than calyx cut
6320 Very smooth, Leaves linear-lanc. Pedunc. terminal dichotomous bracted, Pet. broad obovate 2-parted

§ 1. *Caps. 3-valved, Leaves linear, with scarious stipules at base.*

6321 Smooth, Stem erect, Leaves subulate 1-sided, Petals shorter than calyx
6322 Hispid, Stem erect, Branches divaricating, Lvs. setaceous twice as short as joints, Pet. obt. shorter than calyx
6323 Stems prostrate hairy, Leaves filiform shorter than the joint, Sepals lanceolate obtuse scarious at edge
6324 Like the last, but nearly smooth
6325 Stems prostrate, Leaves half cylindrical fleshy as long as joints, Seeds with a membranous wing
6326 Pilose subhispid, Leaves filiform longer than joint, Stamens 5, Seeds obcord. compressed, Caps. globose

§ 2. *Leaves grassy, linear, lanceolate or rounded, without stipules, Caps. 3-valved.*

* *Leaves grassy.*

6327 Stems erect simple, Lvs. subul. filiform rough, Panic. trichotomous pubescent lax, Calyxes very obtuse
6328 Leaves subulate-filiform serrulate, Stems erect simple, Panicle trichotomous smooth compact
6329 Leaves lin. setaceous ciliated rough, Stems erect rigid simple, Sepals acute scarcely longer than corolla
6330 Stems ascending few-fl. pubescent, Lvs. setaceous rigid, Cauline straight, Sepals obtuse striated villous
6331 Leaves setaceous rigid mucronate striated, Stems panicled few-fl. Sepals lanc. much shorter than corolla

** *Leaves subulate or linear.*

6332 Lvs. subulate rigid spiny : lower fascicled ; upper distant, Stems erect firm, Pet. obov. twice as long as cal.
6333 Erect smooth many-stemmed, Leaves subulate linear erect, Pan. few-fl. Petals conspicuously striated
6334 Leaves subulate tooth-ciliated, Stems ascending 3-6-fl. roughish, Cal. cylindrical, Sepals 3-nerved hairy
6335 Like the last, but stems rigid few-fl. Leaves long straight, Pedunc. and calyx viscid hairy
6336 Lvs. lin. subul. 3-nerved, Stem panicled, Pedunc. terminal very long twin downy, Pet. obt. emarginate
6337 Like the last, but stems 2-4-fl. Leaves narrow recurved
6338 Lvs. subulate broadish flat 3-nerved ciliated, Radical clustered, Stems 1-fl. Pedunc. very long pubescent
6339 Tufted many-stemmed, Leaves subulate obtuse nerved, Stems panicled elongated
6340 Erect branched, Leaves linear subulate 3-nerved, Pedunc. twin terminal 1-flowered
6341 Leaves subulate, Stems panicled, Sepals ovate
6342 Stems filiform rooting very long diffuse, Flowering branches erect few-fl. Lvs. lin. flat acute fascicled
6343 Leaves subulate setaceous, Stem branched dichotomous, Sepals subulate striated much longer than petals
6344 Stem much branched, Leaves lin. recurved, Sepals with a long point and membranous edge
6345 Radical lvs. clustered recurved subul. 1-sided, Stems tufted simple 3-fl. Sepals and peduncles hairy gland.
6346 Stem much branched, Fl. panicled fastigiate, Leaves setaceous fascicled 1-sided ciliated at base
6347 Leaves subulate fascicled setaceous, Stems erect straight simple, Sepals acuminate with 2 lines
6348 Leaves setaceous fascicled with 2 stripes, Stems suffruticose dichotomous, Pedunc. term. 1-2-flowered
6349 Lvs. setaceous not ciliated at base, Stems tufted prostrate at base, Pedunc. longer than leaf, Sepals awned
6350 Procumbent, Leaves linear obt. Peduncles 2 or 3 1-flowered with 2 bractes at base, Sepals without nerves
6351 Leaves subulate rigid spiny and flowers whorled, Pedunc. 4-fl. capitate

*** *Leaves lanceolate, oval or rounded.*

6352 Leaves ovate carinate recurved edged imbricated 4 ways, Stems straight downy, Sepals rigid acute keeled
6353 Tufted villous, Branches ascending, Leaves lanceolate narrow acute rigid nerved
6354 Like the last, but smaller, with creeping and tufted stems, and imbricated leaves
6355 Pubescent, Leaves lanc. linear, Barren stems very long procumbent, Pedunc. terminal long 1-flowered
6356 Leaves ovate acute sessile regular ciliated and smooth, Sepals lanceolate 3-nerved acute green opaque
6357 Pubescent, Lvs. ovate acute stalked, Stems spreading branched elongated, Sepals acute shorter than cor.
6358 Leaves oblong acute 3-nerved ciliated imbricated, Stem prostrate, Sepals lanceolate acuminate striped
6359 Leaves lanc. acute spreading hard rough, Stem simple short, Sepals ovate acuminate striped
6360 Leaves ovate and obovate blistered rugose more or less nerved and ciliated, Stems procumbent
6361 Like the last, but leaves pulpy thick and sepals scarcely nerved
6362 Stem slender branched, Lvs. ovate acute stalked ciliated nerved, Pedunc. long bent down after flowering

and Miscellaneous Particulars.

considerably in the number of their stamens, more generally falling short of than exceeding the regular number.

History, Use, Propagation, Culture,

1051. *Cherleria.* John Henry Cherler was an assistant of John Bauhin in preparing his Historia Plantarum. A little obscure weed.

1052. *Brunnichia.* A catalogue of the books upon natural history was published by one Mr. F. Brunnich, a Danish naturalist, in 1793.

1053. *Garidella.* So named by Tournefort, in honor of Pierre Garidel, M. D., physician at Aix in Provence, author of Histoire des Plantes qui naissent en Provence, 1719, with many figures. A plant of little curiosity or beauty. Small inconspicuous plants of the easiest management.

1054. *Malpighia.* So named by Plumier in honor of Marcello Malpighi, professor of medicine at Bologna, author of Anatome Plantarum, 1765 and 1769; a celebrated work, the best of its time on the structure of vegetables. The species are handsome evergreen trees and shrubs, some of them fruit-bearing and others climbers. M. glabra is grown for its fruit in the West Indies, and the fruit of M. urens is also eaten under the name of Barbadoes cherry, but that of both species is much inferior to European cherries. All the species have the under sides of their leaves covered with prickly bristles which when handled run into the fingers. Ripened cuttings root freely in sand under cover.

1055. *Banisteria.* So named by Dr. Houstoun, in memory of the Rev. John Banister, a curious botanist, who lost his life in search after plants in Virginia. The species are chiefly evergreen climbers and twiners; some of them, as B. fulgens and chrysophylla, have fine shewy foliage as well as beautiful flowers.

6363 Tufted creeping, Leaves ovate shining fleshy ciliated, Pedunc. long 1-fl. Flowers cernuous
6364 Leaves ovate acute fleshy approximated, Fl. solitary on short stalks, Sepals obl. acute as long as cor.
6365 All over pubescent, Leaves lin. lanceol. Stems prostrate much branched, Seeds very minute

6366 Leaves spreading

6367 Leaves cordate sagittate

6368 Petals sessile spreading, Stamens 10-12

6369 Leaves ovate entire smooth, Peduncles umbelled
6370 Leaves ovate entire smooth, Peduncles 1-flowered
6371 Leaves entire oblong acute smooth shining with 2 glands beneath at the base
6372 Leaves entire oblong lanceolate acute smooth with 2 glands at a distance from the base
6373 Leaves ovate nearly entire with hairs on both sides, Fl.-stalks with a truncate gland at top
6374 Leaves ovate elliptical acuminate entire smooth with 2 glands at base
6375 Leaves oblong acuminate entire smooth, Racemes axillary, Fl. monogynous
6376 Leaves elliptical shining hairy beneath, Fl. axillary corymbose

6377 Leaves obl. ovate with decumbent stiff bristles, Peduncles 1-fl. aggregate
6378 Leaves lin. lanceol. with decumbent bristles on each side, Peduncles umbelled
6379 Leaves obl. obtuse pubescent, Racemes axillary compound
6380 Leaves ovate entire obtuse downy beneath, Racemes terminal
6381 Leaves ovate downy beneath acute, Flowers yellow spiked
6382 Leaves obovate wedge-shaped entire veinless shining, Raceme terminal
6383 Leaves ovate acute entire smooth on each side, Racemes terminal spiked
6384 Leaves oval acuminate shining, Racemes corymbose terminal
6385 Leaves lanceol. toothed-spiny hispid beneath
6386 Leaves subovate toothed-spiny

6387 Leaves orbicular cordate ciliate toothletted smooth, Petioles with 2 glands
6388 Leaves roundish ovate obtuse smooth, Racemes axillary and terminal, Seeds erect
6389 Leaves ovate oblong acutish towards the end obsoletely ciliated beneath shining gold-colored
6390 Leaves ovate-oblong rigid, Racemes terminal
6391 Leaves ovate oblong entire beneath shining, Panicle terminal leafy
6392 Branches 2-edged, Leaves ovate downy beneath, Petioles with 2 glands
6393 Leaves subovate downy beneath, Racemes brachiate, Peduncles umbelled
6394 Leaves downy beneath orbicular cordate, Branches divaricating roundish, Petioles with 2 glands
6395 Leaves subovate, Branches brachiate, Seeds narrower inwards

6396 Leaves simple obovate obtuse pubescent above smooth beneath

6397 Leaves pinnated, Leaflets ovate stalked smooth on each side, Racemes fascicled

PENTAGYNIA.

6398 Leaves pinnated, Leaflets ovate-lanceolate, Fruit oblong with obtuse angles
6399 Leaflets ovate unequal acuminate, Fruit obl. acute-angled

and Miscellaneous Particulars.

All of them root freely in ripened wood in sand under a hand-glass. In most respects they resemble the last genus.

1056. *Hiræa.* Named after John Nicholas de la Hire, a French physician, who died in 1727. Plants with the appearance of Banisteria.

1057. *Cnestis.* From κνηθω, to scratch. The capsules, covered with hairs, excite a troublesome itching. Fine evergreen stove shrubs.

1058. *Averrhoa.* So named in honor of Ebn Elvelid Ebn Rushad, commonly called Averrhoes, of Corduba in Spain, a famous commentator on Aristotle and Avicenna. He also published Calliget, or the plants used in food, &c. He died at the beginning of the thirteenth century. The specific names are vernacular appellations. The species are evergreen trees, singular for the fruit growing frequently on the trunk itself, below the leaves: the flowers grow in racemes; the fruit is a five-celled pome. A. Bilimbi is a beautiful tree with a green fleshy oblong fruit the thickness of the finger, filled with a grateful acid juice; the substance and seeds not unlike those of cucumber. They make a syrup of the juice, and a conserve of the flowers, which are esteemed excellent in fevers and bilious disorders. A. carambola bears a fruit the size of a hen's egg, with a pulpy subacid juice, used ripe and also pickled green, and employed also in dying, and other economical purposes. The petioles and branches of this tree are said to have a peculiar sensitive quality, of which an account is given by Dr. Bruce in the Philosophical Transactions,

History, Use, Propagation, Culture,

Both species form handsome plants in our stoves; they grow freely, and ripened cuttings root readily in sand under a hand glass.

1059. *Spondias.* One of the Greek names of the plum. The plants of this genus bear fruit like plums, which are also called hog plums in the West Indies. These are deciduous fruit-bearing trees, natives or cultivated in both Indies. S. Mombin (the South American name) flowers from the sides of the branches, and is known by its oblong or ovate fruit like a plum, having a luscious thin pulp covering a large fibrous stone. The skin is yellow, purple, or variegated; the pulp is yellow and thin, having a singular but not unpleasant taste, and a sweet smell. The seed scarcely ever ripens, but it is so easily increased by cuttings, that if a branch laden with young fruit be set in the ground, it will grow, and the fruit will soon come to maturity. In St. Domingo they make hedges of the boughs, which flower and bear fruit in a few months. It is also cultivated for the sake of the fruit, though it is not in much esteem in Jamaica.

The flowers of S. Myrobalanus (the Myrobalanus of Dioscorides was an Egyptian or Arabian tree, which

6400 Common petiole compressed
6401 Common petiole round, Leaves shining acuminate
6402 Common petiole round with 6 pairs of leaflets which are serrated and ribbed

6403 Leaves orbicular spatulate powdery obtuse with a point, Fl. panicled, Stem erect branched
6404 Leaves ovate spatulate obtuse powdery with a point edged with red, Fl. panicled, Stem erect branched
6405 Leaves opp. rounded ovate, Flowers corymbose
6406 Leaves obl. spatulate obtuse smooth with a point, Fl. panicled, Stem erect branched
6407 Leaves semicylindrical scattered, Fl. panicled nodding, Tube curved
6408 Leaves ovate spatulate obtuse with a point powdery, Fl. panicled, Stem much branched divaricating
6409 Leaves wedge-shaped fascicled, Stem thickened, Branches fleshy conical
6410 Leaves obovate acute fleshy, Spike leafy terminal
6411 Leaves crossing rounded mucronate glaucous, Fl. panicled pendulous
6412 Leaves half orbicular scurfy dotted flat above, Fl. few small sessile
6413 Leaves spatulate obtuse naked with a point
6414 Leaves glaucous narrow tongue-shaped at the end obcuneate mucronate, Fl. cymose, Stem leafy

6415 Leaves oval crenate, Stem spiked
6416 Leaves oblong nearly round, Flowers fascicled
6417 Leaves lanceolate acute fleshy, Spike cylindrical terminal leafless
6418 Leaves peltate crenate, Stem nearly simple, Fl. pendulous, Bractes entire

6419 Leaves peltate crenate, Stem nearly simple, Flowers erect, Bractes toothed

6420 Leaves whorled 4

6421 Leaves amplexicaul. cordate ovate obtuse unequally and deeply serrated
6422 Leaves amplexicaul. cordate oblong obtusely serrated whitish
6423 Leaves flattish serrated, Corymb leafy, Stem erect
6424 Leaves flat ovate acute at each end toothed, Flowers in corymbose fascicles
6425 Leaves wedge-shaped narrowed at the base subsessile, Stems decumbent, Fl. corymbose
6426 Leaves wedge-shaped rhomboid emarginate stalked, Stems branched, Pan. term. divaricating
6427 Leaves lanceolate serrated flat, Stem erect, Cyme sessile terminal
6428 Leaves roundish obovate flat crenated at end with a cartilaginous muricated edge
6429 Leaves flat opposite spatulate toothed
6430 Leaves wedge-shaped concave somewhat toothed aggregate, Branches creeping, Cyme terminal
6431 Leaves flat cordate toothed stalked, Corymbs terminal
6432 Leaves whorled obovate entire smooth, Cyme in three divisions
6433 Leaves flattish angular, Fl. lateral subsessile solitary
6434 Stems branched, Leaves entire: lower spatulate, Stigmas acute
6435 Leaves flat lanceolate, Stem branched, Flowers panicled, Petals acute awned
6436 Radical leaves obovate with a long mucronate point, Stem simple, Spike term. long

6437 Leaves opposite ovate obtuse fleshy, Stem weak, Fl. scattered
6438 Leaves subulate scattered separate at base: the lower recurved
6439 Leaves glaucous subulate scattered separate at base, Fl. cymose, Cal. lanceolate
6440 Lvs. rounded subulate acute: those of the barren branches glaucous spreading, Branches of cyme recurved
6441 Lvs. rounded subulate acute: those of the barren branches glaucous spreading, Branches of cyme compact
6442 Leaves subulate in 7 rows glaucous very close distinct at base [erect
6443 Leaves subulate scattered separate at base, Fl. in cymes, Petals half as long as lanceolate calyx
6444 Leaves subulate scattered separate at base glaucous, Fl. in cymes, Petals twice as long as calyx
6445 Leaves subulate spreading in many rows close, Cal. short obtuse
6446 Leaves oblong alternate obtuse separate at base, Cyme bifid smooth
6447 Leaves flat spatulate ovate acute entire pubescent, Corymb hemispherical

and Miscellaneous Particulars.

bore a perfumed fleshy fruit. Jacquin applied the name to this South American plant, which is nearly similar in properties) come out before the leaves make their appearance, and are succeeded by yellow plums the size of a pigeon's egg, which are eaten by children, and considered excellent food for hogs. It grows by large cuttings as freely as the other. S. dulcis is a handsome tree; the pulp of the fruit is firmer than that of the others, and tastes like a Reinette apple. It is cultivated in the Society and Friendly islands, especially in Otaheite; the fruit is of a gold color, hangs in little nodding bunches, and is esteemed both tasteful and wholesome: its flavor resembles that of the pine-apple.

1060. *Cotyledon.* From κοτυλη, a vessel or cup. Many of the species of this genus have cup-shaped leaves. The species are succulents of little beauty, and of the easiest culture in light earth and lime rubbish, or in sand and loam.

1061. *Sedum.* From *sedere*, to sit: these plants growing upon the bare rock, look as if sitting upon it. The species are low succulents, some of them pretty, others curious; but none of them remarkable in any way.

History, Use, Propagation, Culture,

They seem destined by nature to clothe rocks and dry arid places, after a certain portion of vegetable soil has been generated by lichens and mosses.

Orpine is the French name of two or three species. S. album is said to have the same virtues as used to be attributed to the houseleek, Sempervivum tectorum: it is pickled by some in the manner of samphire. S. acre is considered antiscorbutic; its juice applied to the skin blisters it, taken inwardly it vomits, and applied externally to gangrenes promotes suppuration.

1062. *Penthorum.* From πεντα, five, in allusion to the five-marked angles of the capsules. Succulent North American plants of no beauty whatever.

1063. *Grielum.* A small uninteresting Cape plant, with yellow flowers and hoary leaves like southernwood. Derived from γεῤῥιος, old, in allusion to its hoary aspect.

1064. *Biophytum.* Βιο φυτον, plant of life, in allusion to the lively irritable nature of the foliage. This genus, the Oxalis sensitiva of Jacquin, has been lately divided by M. De Candolle from Oxalis, chiefly on

6448 Petals 8, Leaves scattered: the lower rounded; upper depressed

6449 Leaves scattered rounded obtuse, Stem simple, Fl. in umbels with 4 petals
6450 Leaves linear rounded depressed scattered, Cyme open, Petals 4
6451 Leaves oblong obtuse roundish sessile spreading, Cyme branched
6452 Leaves subovate adnate-sessile gibbous nearly erect alternate, Cyme trifid
6453 Leaves subovate adnate-sessile gibbous nearly erect imbricated six ways
6454 Leaves subovate adnate-sessile gibbous alternate, Cyme branched bifid
6455 Stem erect solitary annual, Leaves ovate sessile gibbous alternate, Cyme recurved
6456 Leaves oblong flattish above and peduncles axillary about 1-fl. pubescent, Petals ovate obtuse
6457 Leaves whorled linear, Stem procumbent panicled, Peduncles villous viscid
6458 Stem erect, Flowers corymbose fastigiate
6459 Leaves scattered oblong-cylindrical obtuse, Stems shrubby much branched, Cymes terminal

6460 The only species

6461 Peduncles simple 1-fl. Leaves tripartite multifid linear downy

6462 Peduncles many-fl. at end

§ 1. *Peduncles many-flowered, Stems suffruticose, Cells of ovary usually* 1 *seeded.*
6463 Stem erect leafy, Umbel 4-fl. the length of leaves, Leaflets entire ovate obtuse

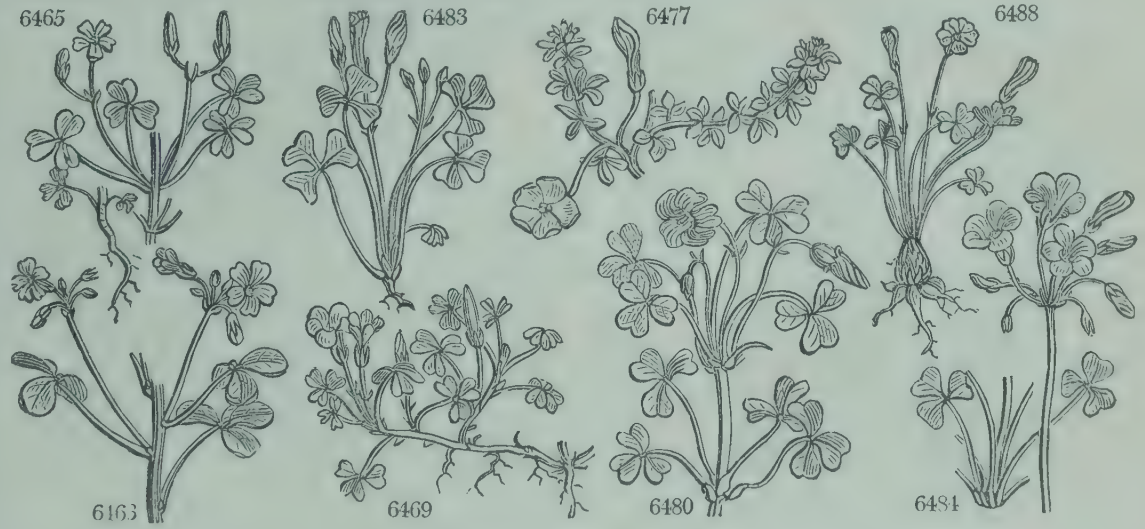
§ 2. *Caulescent, Leaves palmate* 3*-foliate, Leaflets all sessile, obcordate.*
6464 Pedunc. 2-3-fl. somewhat longer than leaf-st. Lvs. 2-lobed obcord. ciliated, Styles a little longer than inner [stamens
6465 Stem hairy, Umb. 5-6-fl. longer than leaves, Lvs. obcordate, Styles longer than both stamens
β Stem decumbent, Peduncles 2 or 3-flowered
6466 Stem erect, Umbels 2-6-fl. about as long as leaves, Leafl. obcord. Styles the length of inner stamens
6467 Stem rooting, Peduncles shorter than leafst. Leafl. obcordate, Styles the length of inner stamens
6468 Smoothish, Pedunc. 2-fl. longer than leafst. Leafl. 2-lobed, Styles the length of inner stamens

6469 Stem rooting, Pedunc. 2-fl. the length of leafst. Leaflets obcordate, Styles middling
6470 Stem erect, Pedunc. axill. four times as long as leaf at the end corymbose racemose, Leafl. obcordate
6471 Stem naked at base, Pedunc. lateral umbell. at end, Leafl. cun. emarg. Styles shorter than outer stamens

§ 3. *Caulescent, Leaves sessile,* 3*-leaved, villous, not glandular, Pedunc. axillary,* 1*-flowered.*
6472 Stem branch. Ped. much long. than lvs. Bractes next cal. Leafl. lin. emarg. Styles long. than inner stam.
6473 Ped. 4 times as long as lvs. Bractes appressed to cal. Leafl. lin. cun. obt. Styles shorter than outer stamens
6474 Stem declined, Branches 1-sided, Leafl. lin.-cuneiform, Peduncles scarcely longer than leaves
6475 Leafl. lin. cun. ret. Ped. much long. than lvs. Bractes remote from cal. Stam. with neither teeth nor glands
6476 Stem much branched, Leafl. lin. cuneate obt. Pedunc. much shorter than lvs. Bractes remote from cal.
6477 Leafl. lin. cuneate, Pedunc. much longer than leaves, Bractes remote from cal. Styles intermediate
6478 Leafl. obl. cuneiform, Pedunc. much longer than leaves, Bractes remote from cal. Styles intermediate

§ 4. *Caulescent, sparingly leafy, Leaves stalked,* 3*-5-leaved, Pedunc. axill.* 1*-flowered.*
6479 Stem short, Leaves on long stalks, Leafl. 3 ovate-rounded, Styles very short
6480 Stem branched, Leaves stalked in fascicled whorls with 3 obcordate leaflets, Styles very long

§ 5. *Stemless, Pedunc.* 1*-2 or many-flowered, Leaves radical, many-leaved, usually* 3*-leaved.*
6481 Leafl. 3 obcordate silky, Umbel longer than leaves, Fl. nodding, Styles intermediate
6482 Leafl. 3 obcordate smooth, Umb. 3-9. fl. Styles very short, Fl. nodding
6483 Leafl. 3 obcordate 2-lobed smooth, Umb. 2-4-fl. Flowers erect, Styles very short
6484 Leafl. 3 obcordate 2-lobed smooth subciliated, Umb. many-fl. Fl. drooping, Styles very short
6485 Petiole flattish, Leafl. 3 obcordate pubescent, Umb. 2-fl. Sepals entire, Styles very long
6486 Leafl. 3 obcordate smooth subciliate, Umb. 2-5-fl. Sepals 3-toothed at end, Styles very long
6487 Leafl. 3 obcordate 2-parted beneath violet, Umbel 2-fl. Styles middling
6488 Smooth, Pedunc. 1-fl. longer than leaf, Leaflets obcordate, Root tuberous



and Miscellaneous Particulars.

account of its irritable pinnated foliage, and its stamens being distinct, and five of them only being perfect. It is a very pretty annual, and if well managed so as to acquire, as in China, a stem six or nine inches high, is quite a remarkable object. Cultivated in common earth, and propagated by seeds, which it produces in abundance.

1065. *Oxalis.* The Oxalis of the ancients, which was named from ὀξυς, sharp, or sour, was a very different plant from this, which is thought to have been the Oxys of Pliny. The name employed by Linnæus has, however, been adopted by his followers, although Clusius, Ray, Plumier, Tournefort, Haller, and others, called the genus Oxys.

This is a tribe of pretty little plants, of which most of the species flower freely, but all of them are without their leaves half the year. The root is commonly bulbous; in some species only thick and fleshy; in a few branched: the bulbs consist of fleshy scales, sometimes closely imbricate, sometimes loose and diverging. In a few the subterraneous stipe and the terminating fibre of the bulb produce little dog-toothed bulbs, in such

History, Use, Propagation, Culture,

abundance as to fill the whole pot to the very bottom, as in purpurea, cernua, reptatrix. Sometimes the bulb strikes very deep, as in tomentosa; the original bulb near the surface striking a radical fibre downright from its base, which puts out from its side a new bulb, producing the next year's plant, whiist the former perishes. Sometimes fusiform, thick and long fibres spring in a monstrous form from the bulbs, as in glandulosa and some others. Some of the species have a proper stem (*Caulis*), when it bears all the leaves and peduncles alternately, and not in a terminating umbel: this is either branched or quite simple, and that for the most part inconstantly. Others have a stipe; the leaves and flowers being aggregate together at the end of the stalk; this bears none or very few leaves along it, seldom many. In some species the stipe is always subterraneous, as in breviscapa, purpurea, &c.; in others it is always above ground, as in gracilis, versicolor, tenuifolia. Stipes are commonly quite simple; some, however, are branched, the branches terminating in umbels, as in incarnata and polyphylla. Hence the division of the species into caulescent and stipitate. The leaves are not, perhaps, truly sessile in any of the species; they are subsessile in a few, but in most are petioled. They are simple in three species, binate in four, digitate in six, in the rest ternate: almost all of them have an acid

§ 6. *Stemless, Leaves simple.*

6489 Leaves ellipt. obtuse, Scape 1-fl. Filam. smooth, Styles middling covered with glandular hairs
6490 Leaves obovate retuse, Scape 1-fl. Styles very short, Filaments glandular

§ 7. *Stemless, Leaves 2 or 3-leaved, Stalks winged.*

6491 Leafl. 2 roundish obovate emarginate wavy at edge, Styles very long and filaments glandular
6492 Leafl. 2 ellipt. emarg. with a cartilaginous toothletted edge, Filam. glandular
6493 Leafl. 2 lanceolate with a cartilaginous toothletted edge, Filam. glandular
6494 Leafl. 2-3 with a cartilaginous scabrous edge, Filam. smooth
6495 Leafl. 3 obovate emarg. mucronate, Styles and filaments glandular

§ 8. *Stemless, Leaves stalked, 3-leaved, Stalks not winged.*

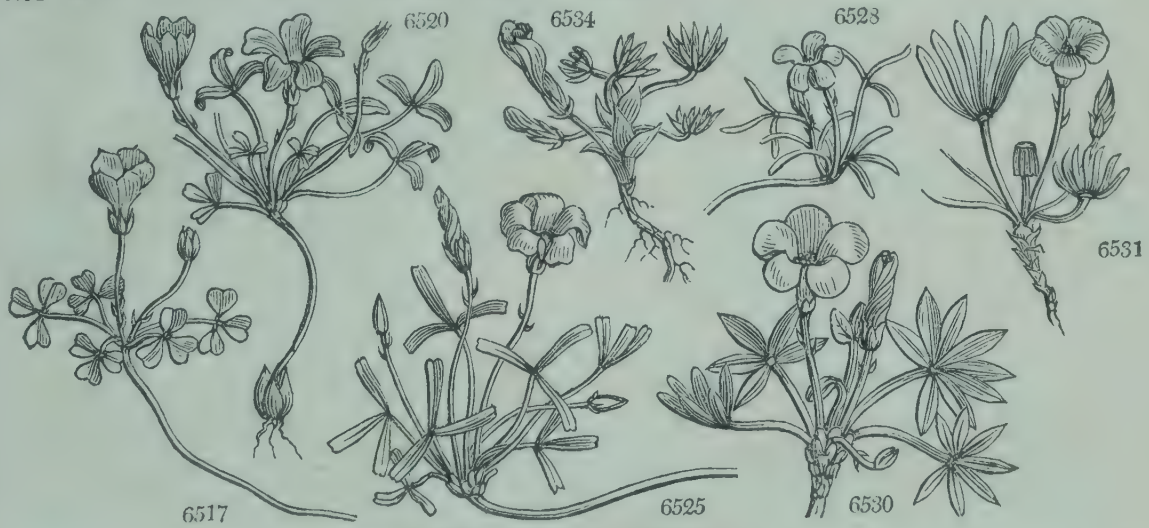
6496 Pubescent, Lateral leaflets obliquely oblong: middle lanceolate, Scapes higher than petioles
6497 Pubescent, Leafl. obl. obt.: middle cuneate at base, Scapes length of petiole
6498 Pubescent, Leafl. obl. obt.: middle subcuneate, Scapes longer than petiole
6499 Pubesc. Leafl. obl. obt. subemarg. Pedunc. longer than petiole with 2 bractes immediately below the cal.
6500 Pubescent, Leafl. obl. emarg. Pedunc. length of petiole with 2 bractes immediately below the cal.
6501 Pubescent, Leafl. obl. retuse: middle cuneate, Peduncles twice as long as leaves with 2 bractes in middle
6502 Subhirsute, Leafl. obov. obl. obt. Pedunc. equal to petiole with 2 bractes in their middle, Styles glandular
6503 Subhirsute, Leafl. obov. obl. obt. Ped. longer than petioles with 2 bractes below their middle, Styles hairy
6504 Pubesc. Leafl. obt. lateral ovate: midd. cuneate, Pedunc. twice as long as petiole with 2 bractes in midd.
6505 Pubesc. Leafl. roundish, Pedunc. as long as pet. with 2 bractes at base, Calyx with clavate hairs at edges
6506 Pub. Leafl. roundish, Ped. as long as pet. with 2 bractes below mid. Cal. with simple and glan. hairs mixed
6507 Pub. Leafl. round.: mid. cun. at base, Ped. as long as lvs. or long. with 2 bractes below mid. Styles very short
β Flowers large, Leaves red beneath
γ Flowers large, Leaves green on both sides
6508 Pubesc. Leafl. roundish, Scapes longer than leaf with 2 bractes below the middle
6509 Smooth, Leafl. roundish dotted, Stipules dilated acuminate, Bractes alternate
6510 Pub. Leafl. obcor. roundish, Scapes nearly twice as short as pet. with 2 bractes in mid. Styles intermediate
6511 Pub. Leafl. obcor. roundish, Scapes thrice as short as petiole with 2 bractes in midd. Styles very long
6512 Densely pubesc. Leafl. obcordate, Scape longer than leaves with 2 bractes above middle, Cal. obtuse
6513 Woolly, Leafl. obcordate, Cal. acute
6514 Root toothed creeping, Leafl. obcord. downy, Scape longer than leaves, Petals oval obtuse
6515 Root toothed creeping, Leafl. obcord. downy, Scape longer than leaves, Pet obl. unequally emarginate
6516 Smoothish, Leaflets obcordate, Scape longer than the leaves, Styles very short
6517 Leaflets obcordate smooth, Pedunc. the length of leaves, Styles very short
6518 Leafl. obcord. 2-lobed, smooth, Pedunc. longer than leaf, Styles intermediate
6519 Leafl. obcord. 2-lobed smooth, Pedunc. longer than leaf, Styles very long
6520 Leafl. cuneate emarg. hairy, Pedunc. the length of petiole, Styles very short, Filam. glandular
6521 Leafl. lin. emarg. downy, Pedunc. shorter than petiole with 2 bractes at summit, Styles very long
6522 Leaflets linear subcuneate emarginate, Pedunc. as long as petiole, Style intermediate

§ 9. *Leaves 3 or 5-leaved, glandular at end.*

6523 Leaflets 3 linear cuneiform emarginate ciliated with many glands beneath
6524 Leaflets 3 linear emarginate with 2 glands beneath, Styles and filaments glandular
6525 Leaflets 3 linear emarginate with 2 calli at end, Styles very short
6526 Leaflets 3 linear emarginate with many glands beneath, Styles very short, Inner filaments glandular
6527 Leaflets 3 linear emarginate with 2 glands beneath, Styles intermediate and filaments glandular
6528 Leaflets 3 linear entire at end and glandular, Styles very long and inner filaments glandular
6529 Leaflets 5 linear at the end nearly entire with 2 callous glands, Styles intermediate

§ 10. *Leaves palmate or peltate, many-leaved, not glandular at end.*

6530 Leaflets 7 lanceolate acutish smooth spotted at base, Petioles compressed, Styles very short
6531 Leaflets 6-7 smooth linear channelled acute, Styles very short, Filam. glandular
6532 Leaflets 7 smooth lin. lanc. obtuse, Cal. appressed, Styles very long and filaments glandular
6533 Leaflets 7-9 smooth lin. emarg. Cal. reflexed at end, Styles intermediate
6534 Leaflets 9-19 all over downy lanceolate cuneate emarginate



and Miscellaneous Particulars.

taste; whence their names of Oxalis or Oxys, wood Sorrel, &c. The partial stem bearing the flower is a peduncle in the caulescent, a scape in the stipitate species.

Many of the species ripen seeds, from which, or from offsets, they are readily propagated, and grown in light sandy soil: care being taken to give the pots little or no water when the plants are in a dormant state. An excellent work has been written on the genus by Jacquin, in which ninety-six species are described. All that were known in Europe at that time, were cultivated in the Imperial gardens of Schönbrunn with great success, under the immediate inspection of Jacquin, by whom the following directions are given for their management. They are best kept in pots which will hold a good many roots. The earth should be so light and sandy as never to become hard, but always to be soft enough not to resist the point of the finger when pressed upon it; when the flowering time is passed, the pots should be placed aside, where they require neither care nor water; but are well protected from mice. In the beginning of August they should be placed in the open air and moderately watered. About the end of that month, or a little later, the leaves should appear. About the middle of September, earlier or later, according to the weather, they should be placed in a very sunny, airy greenhouse,

History, Use, Propagation, Culture,

when they will flower well. Oxalis monophylla and rostrata will not, however, blossom unless placed in a very hot stove.

O. Acetosella, *la petite oseille* or *surelle*, Fr., is used as a salad plant, and is more delicate than the Rumex salads: its acid approaches nearly to that of the juice of lemons, or the acid of tartar, with which it also corresponds in its medical effects, being esteemed refrigerant, antiscorbutic, and diuretic. An infusion of the leaves, or a whey made by boiling the plant in milk, given in ardent fevers, is said to allay inordinate heat, and to quench thirst.

The expressed juice depurated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used whenever vegetable acids are wanted. It is employed to take iron moulds and ink stains out of linen, and is sold under the name of essential salt of lemons. (*Withering.*) This salt when genuine, which it seldom is, consists of the vegetable alkali and a peculiar acid, which, according to Bergman, seems more allied to the acid of sugar than that of tartar. What is sold for it in this country, appears sometimes to consist of C. Tart., with the addition of a small quantity of vitriolic acid. For taking out spots in linen, the stained part is dipped in water, sprinkled with a little of the salt powdered, then rubbed on a pewter plate, after which the spot is washed out with warm water. (*Curtis, from Newm. Chem. by Lewis.*) Twenty pounds of leaves fresh yield six pounds of juice, from which two ounces, two drachms, and one scruple of salt have been obtained. (*Lewis.*)

1066. *Agrostemma.* Αγρος στεμμα, crown of the field. The beauty of the flowers of the common cockle weed well entitles it to such a distinction. The foreign species are very pretty annuals. A. Githago (*git* or *gith* was the name of certain black and aromatic grains, supposed to have been of Nigella sativa, which were employed by the Romans in cookery. The seeds of the plant Githago are externally similar) is an ornamental weed, and along with corn poppy and blue bottle makes a fine appearance in the fields of the slovenly husbandman, where the soil is dry and gravelly.

6535 Hairy, Stem dichotomous, Flowers on long stalks, Leaves linear
β A slight variety, with longer divisions to the calyx
6536 Downy, Stem dichotomous, Peduncles long 1-fl. Cal. campanulate ribbed

6537 Downy, Flowers in umbellate heads, Cal. cylindr. clavate ribbed
6538 Smooth, Stem dichotomous panicled erect, Flowers terminal solitary

6539 Smoothish, Flowers fascicled, Cal. cylindr. clavate ribbed, Petals 2-lobed

6540 Stems ascending smoothish, Fl. dichotomous fascicled, Cal. camp. 10-ribbed, Pet. torn with an appendage
6541 Smooth, Flowers terminal and axillary 1-3, Cal. rounded clavate ribbed, Petals torn
6542 Hairy, Fl. 2-3 fastigiate, Cal. rounded clavate woolly, Petals 4-cleft
6543 Stem viscid about the joints, Limb of petals nearly entire, Leaves linear spatulate

6544 Smooth, Stems tufted upright, Fl. in dense capitate umbels, Cal. camp. Petals bifid
6545 Fl. solitary, Cal. with ten keels, Petals bifid, linear-lanc. subciliated
6546 Fl. dichotomous panicled dicœcious, Petals ½-bifid, Lobes narrow diverg. Caps. round

6547 Fl. dichotomous panicled dicœcious, Petals ½-bifid, Lobes broad approximating, Caps. conical

6548 Smooth glaucous, Stem erect branched or simple, Leaves lanceolate connate obtuse
6549 Hairy pale green viscid, Leaves ovate, Petals length of calyx, Fl. longer than fl.-stalk
6550 Hairy viscid diffuse, Leaves lanceolate oblong
6551 Stem much branched villous, Leaves ovate-lanc. hispid, Flowers numerous in dichotomous panicles
6552 Leaves ovate, Flowers panicled, Cal. villous longer than petals, Caps. scarcely longer than sepals
6553 Hairy viscid, Flowers pentandrous, Petals emarginate
6554 Hairy subviscid, Flower 4-fid 4-androus, Pet. bifid shorter than calyx
6555 Leaves linear lanceolate obtuse ciliated at base, Pet. twice as long as calyx
6556 Glutinous hairy, Fl. solitary in the dichotomies, Sepals lanc. acute the length of petals, Leaves lanc.
6557 Leaves ellipt. naked or hairy, Pan. dichotomous few-fl with bractes, Caps. oblong recurved
6558 Stems prostrate, Leaves ovate acute subciliated smooth, Flowers terminal subcorymbose
6559 Leaves sublinear acuminate smooth, Peduncles glandular, Pet. twice as large as calyx
β Leaves very narrow and smooth
6560 Downy, Leaves lanc.-lin. acute, Flowers very large in dichotomous umbels, Pet. crenate and 2-lobed
6561 Leaves cordate ovate, Stem clasping, Peduncles in fruit very long deflexed

6562 Hairy viscid, Leaves lanceolate, Fl. dicœcious, Petals thrice as long as calyx
6563 Leaves elliptical scabrous, Pedunc. terminal simple subsolitary, Capsule ovate
6564 Leaves oblong spatulate hoary, Sepals hoary scarious at edge, Caps. cylindr. longer than calyx
6565 Very smooth, Leaves lanc. linear, Pedunc. very long, Caps. acute shorter than corolla

6566 This is the Cerastium aquaticum of English botany

and Miscellaneous Particulars.

A. coronaria and flos-jovis are shewy border flowers, the first generally increased by seeds, and the other by cuttings or division of the plant.

1067. *Lychnis.* From λυχνος, a lamp, in allusion to the cottony leaves of some species, which have been used as wicks to lamps. L. chalcedonica, *Croix de Malthe*, Fr. and Portug., *Croce de Cavaliere*, Ital., and *C. de Jerusalem*, Span., is an old and much esteemed border flower, the double varieties of which require some care in cultivation, to prevent their returning to the single state, and to propagate them by cuttings. L. fulgens and coronata are also very handsome species. "They do best in a light rich loamy soil, but they must be often taken up and divided, or they dwindle away; the best time of doing this is early in spring. L. coronata thrives and flowers abundantly if planted out in the open ground in spring; but it requires to be taken up in autumn and potted, or the severe frosts in winter will kill it, or injure it very much. All may be raised by cuttings planted under hand-glasses, or by seeds, which often ripen in abundance. (*Bot. Cult.* 389.)

L. viscaria and flosculi are more hardy, and grow in common garden soil, and increase abundantly by division: they are both old inhabitants of the flower garden. L. diurna and vespertina are also border flowers in their double varieties.

1068. *Cerastium.* Derived from κερας, a horn, in allusion to the cornute form of the capsule of many species. Most of the annual species, and some of the others, are weeds; a few may be grown in pots or on rock-work, for both of which they seem well adapted. They are very prolific in seeds, and contribute materially to the support of small birds.

1069. *Larbrea.* A genus founded by Aug. St. Hilaire, in the second volume of Mémoires du Muséum, upon the Cerastium aquaticum of Linnæus. He named it after the Abbé de Larbre, who at the age of 80, published a Flora of Auvergne.

History, Use, Propagation, Culture,

1070. *Spergula.* From *spargere,* to scatter, because it scatters its seeds abroad, to the great profit of the farmer in Holland, who obtains from it meadows affording the most delicious butter. S. arvensis is a common weed in sandy soils, in Scotland called yarr, and in Norfolk pickpurse. In the Netherlands and in Germany it is sown on corn stubbles, to supply a bite for sheep during winter. It may be sown and reaped in eight weeks, either in autumn or spring. It is said to enrich the milk of cows, so as to make it afford excellent butter; and the mutton fed on it is preferable to that fed on turnips. Hens eat spurry greedily, and it is supposed to make them lay a great number of eggs, whether in hay, or cut green, or pasture. Von Thaer observes, it is the most nourishing, in proportion of its bulk, of all forage, and gives the best flavored milk and butter. It has been recommended to be cultivated in England; but it is not likely that such a plant can ever pay the expense of seed and labour in this country, even on the poorest soil; or at all events, as Professor Martyn observes, we have many better plants for such soils.

1071. *Phytolacca.* From φυτον, a plant, and *lacca,* lac; that is to say, a plant whose fruit gives out a fine red color like lac. The English-American name Poke, applied to one species, is a corruption of Pocan, the name by which it was formerly known in Virginia.

P. decandra has large ramose roots, shoots half an inch in diameter, and five or six feet high; the leaves five inches long, and two and a half inches broad, smooth and of a deep green. It grows vigorously in a good deep soil, and furnishes ample supplies of young shoots, which in America and the West Indies are boiled and eaten as spinage. (*Correa de Serra, in Hort. Trans.* iv. 446.)

6567 Leaves whorled, Pedunc. in fruit reflexed, Seeds reniform angular rough
6568 Leaves whorled, Flowers pentandrous, Seeds depressed winged smooth
6569 Leaves opposite subulate smooth: upper fascicled, Cal. not nerved
6570 Leaves opposite subulate blunt naked, Pedunc. solitary very long smooth
6571 Leaves opposite subulate awned ciliated, Pedunc. very long solitary hairy

DECAGYNIA.

6572 Flowers octandrous octogynous
6573 Flowers decandrous pentagynous
6574 Flowers dodecandrous octogynous, Leaves ovate obl. with a recurved point
6575 Flowers decandrous decagynous
6576 Flowers icosandrous decagynous
6577 Flowers diœcious

and Miscellaneous Particulars.

An ounce of the dried root, infused in a pint of wine, and given to the quantity of two spoonfuls, operates kindly as an emetic, and is preferable to most others, as it hardly alters the taste of the wine. In its medicinal properties, the Phytolacca approaches nearer to Ipecacuanha than to any other vegetable; but it is slower in its effects, and it remains longer in action, although it may be checked by an opiate. Sometimes its operation produces vertigo and stupor. The powder of the leaves possesses the same virtues as the root, but in a weaker degree. It is one of the plants which have had a temporary reputation for the cure of cancer, and some sensible men have been converts to its efficacy. The fermented berries give out a liquor which yields alcohol by distillation. From half a bushel of the berries, six pints of spirits were obtained, sufficiently strong to take fire and burn with readiness. Two ounces of this given to a dog occasioned nausea and drowsiness, with slight spasmodic motions, but no vomiting. Poultry are fond of the berries, but if eaten in large quantities, they give the flesh a disagreeable flavor. The juice stains paper and linen of a beautiful purple color, but it will not last long; if a method could be found of fixing the dye, it might be very useful. The vignerons in Portugal for many years used the juice of the berries of the elder-bush to give a deep color to the Port wines, to which it was thought to communicate a disagreeable taste when mixed in too great a quantity. Complaint of this practice having been made to government, orders were given that the stems of that plant should be cut down and destroyed before they produced berries: but they forgot to include the Phytolacca in the proscription, so that the berries of that plant supply the same purpose in a much worse manner.

Class XI. — DODECANDRIA. 12 Stamens.

This is a small incongruous class, containing no extensive genus of importance except Euphorbia. Some botanists have been of opinion that it ought to be cancelled, but it is probable that Linnæus understood the application of his own principles as well as some of his more pretending followers, and it is certain that if the Linnean plan can be made to act successfully, its artificial arrangement must be rigorously observed. Euphorbia and Reseda, which are usually referred hither, should more properly be referred, the former to Monœcia, and the latter to Polygamia.

Order 1. MONOGYNIA. 12 Stamens. 1 Style.

1072. *Asarum.* Cal. 3-4-cleft, superior. Cor. O. Capsule coriaceous, crowned.
1073. *Bocconia.* Cal. 2-leaved. Cor. O. Style bifid. Caps. 2-valved, 1-seeded.
1074. *Bassia.* Sepals 4. Cor. 8-cleft, with an inflated tube. Stamens 16. Drupe 5-seeded.
1075. *Blakea.* Sepals 6, inferior, with a superior entire calyx. Petals 6. Caps. 6-celled, many seeded.
1076. *Bejaria.* Cal. 7-cleft. Petals 7. Stamens 14. Berry 7-celled, many-seeded.
1077. *Agathophyllum.* Petals 6. Calyx truncate. Drupe 1-seeded.
1078. *Rhizophora.* Cal. 4-parted. Cor. 4-parted. Stigmas 2. Seed 1 very long, fleshy at base.
1079. *Garcinia.* Sepals 4, inferior. Petals 4. Berry 8-seeded, crowned by the peltate stigma.
1080. *Grangeria.* Cal. 5-cleft. Petals 5. Stamens 15. Drupe 3-cornered. Nut 3-cornered, bony, 1-seeded.
1081. *Halesia.* Cal. 4-toothed, superior. Cor. 4-cleft. Nut quadrangular, 2-seeded.
1082. *Decumaria.* Sepals 8-12, superior. Petals 8-12. Caps. 8-celled, many-seeded.
1083. *Eurya.* Cal. 5-leaved, with 2 bractes at base. Petals 5. Caps. 5-celled, many-seeded.
1084. *Aristotelia.* Sepals 5. Petals 5. Style trifid. Berry 3-celled. Seeds twin.
1085. *Canella.* Cal. 3-lobed. Petals 5. Anthers 16, united to an urceolate nectary. Berry 1-celled, 2-4-seeded.
1086. *Cratæva.* Petals 4. Cal. 4-cleft. Berry 1-celled, many-seeded.
1087. *Triumfetta.* Petals 5. Sepals 5. Capsule hispid, opening in four.
1088. *Peganum.* Petals 5. Sepals 5, or O. Capsules 5-celled, 3-valved, many-seeded.
1089. *Hudsonia.* Petals 5. Sepals 3, tubular. Stamens 15. Capsules 1-celled, 3-valved, 3-seeded.
1090. *Nitraria.* Petals 5, vaulted at end. Cal. 5-cleft. Stamens 15. Drupe 1-seeded.
1091. *Portulaca.* Petals 5. Cal. 2-fid. Capsule 1-celled, cut across.
1092. *Talinum.* Petals 5. Sepals 2. Capsule 3-6-valved, many-seeded. Leaves without stipules. Seeds not winged.
1093. *Anacampseros.* Like Talinum, but having stipules and winged seeds.
1094. *Lythrum.* Cal. 12-toothed, tubular, unequal at base. Petals 6, inserted in calyx. Caps. 2-celled, many-seeded.
1095. *Nesæa.* Like Lythrum, but calyx campanulate.
1096. *Heimia.* Cal. 12-toothed. Petals 6. Capsule 4-celled.

History, Use, Propagation, Culture,

1072. *Asarum.* An ancient name, said to have been formed from α, privative, and σειρα, bandage, because it was not used in garlands of which the ancients were so fond; in that case it should be *Asārum.* The common name, *Asarabacca*, is Latin, *qu:* the berry of Asarum? Little inconspicuous herbaceous plants. The leaves of A. europæum are emetic, cathartic, and diuretic; and, perhaps, as Dr. Cullen has remarked, they form the most useful species of errhine stimulants. A proper dose snuffed up the nose for a few successive evenings at

1097. *Cuphea.* Cal. 6-12-toothed, occasionally gibbous at base. Pet. 6, inserted in calyx, or O. Caps. 1-celled, opening on one side longitudinally along with the calyx.
1098. *Kleinhovia.* Sepals 5. Petals 5. Nect. campanulate, 5-toothed, staminiferous, united to the column of ovary. Ovary stalked. Caps. with 5-angles and 5-cells inflated, cells 1-seeded.

Order 2. DIGYNIA 12 Stamens. 2 Styles.

1099. *Callicoma.* Flowers in round heads. Calyx 4-5-leaved. Corolla O.
1100. *Heliocarpus.* Sepals 4. Petals 4. Styles simple. Caps. 2-celled, compressed, radiating on each side longitudinally.
1101. *Agrimonia.* Cal. 5-toothed, surrounded by another. Petals 5. Grains 2, in the bottom of the calyx.

Order 3. TRIGYNIA. 12 Stamens. 3 Styles.

1102. *Reseda.* Involucre many-leaved spreading. Hermaphrodite flower central, apetalous, surrounded by several fringed petaloid barren flowers.
1103. *Euphorbia.* Involucre 1-leaved, ventricose, regular. Flowers naked, aggregate. Female floret surrounded by many monandrous male florets.
1104. *Pedilanthus.* Like Euphorbia, but involucre calceiform.
1105. *Visnea.* Cal. 5-leaved, inferior. Petals 5. Stigmas 3. Nut 2-3-celled, half inferior.

Order 4. TETRAGYNIA. 12 Stamens. 4 Styles.

1106. *Calligonum.* Cal. 5-parted. Corolla O. Filaments about 16, united at base. Ovary superior, 4-cornered. Styles 4. Nut with a many winged crust, 1-celled.

Order 5. PENTAGYNIA. 12 Stamens. 5 Styles.

1107. *Glinus.* Sepals 5. Cor. O. Nectary with bifid bristles. Caps. 5-angular, 5-celled, 5-valved, many-seeded.
1108. *Blackwellia.* Cal. ½-superior, persistent, at the base turbinate, many-parted; with villous ciliated segments. Petals 15. Capsule 1-celled, many-seeded.
1109. *Gastonia.* Cal. entire. Petals 5-6. Stam. 10-12: two opposite each petal. Styles 10-12, very small, united at base. Capsules 10-12-celled.

Order 6. DODECAGYNIA. 12 Stamens. 12 Styles.

1110. *Sempervivum.* Cal. 12-parted. Petals 12. Caps. 12, many-seeded.

MONOGYNIA.

History, Use, Propagation, Culture,

lished by Morrison at Oxford, 1764, quarto, and other works. B. frutescens is very ornamental in its foliage. The Indian kings, Hernandez tells us, planted it in their gardens, which must have been for its beauty, as it is neither culinary nor medicinal, though the juice is acrid, and used in the West Indies to take off warts.

1074. *Bassia.* So named by Koenig, in honor of Ferdinando Bassi, curator of the botanic garden at Bologna. Tall trees, natives of the hottest parts of the East Indies, with tufted alternate leaves growing only at the end of the shoots. Ripened cuttings root freely in sand.

1075. *Blakea.* So named by Dr. Patrick Browne, after Mr. Martin Blake of Antigua, a great promoter of useful knowledge, and a patron of the doctor's Natural History of Jamaica. This is one of the most beautiful plants of the West Indies. It supports itself for a time by the help of some neighboring shrub or tree, but it grows gradually more robust, and at length acquires a pretty moderate stem, which divides into a thousand weakly declining branches, well supplied with beautiful rosy blossoms on all sides. It cannot display itself to so great advantage in our stoves; but it flowers freely, and thrives well in loam and peat, well supplied with water. Ripe cuttings root in sand in moist heat and covered.

1076. *Bejaria.* So named by Mutis, in honor of Bejar, a Spanish botanist. The original species are natives of New Grenada. That in gardens, which is a native of the southern states of North America, is a beautiful shrub from three to four feet high, with pink flowers of an agreeable scent. It is found upon the banks of swamps and ponds, and requires the protection of a frame or greenhouse.

1077. *Agathophyllum.* From αγαθος, good, and φυλλον, a leaf. The leaf has a pleasant smell like cloves. In Madagascar, where it is called *Ravendsara*, it forms a large tree with a rufous aromatic bark, and a heavy insipid wood. The leaves are alternate and coriaceous. The dried fruit is very aromatic.

1078. *Rhizophora.* From ριζα, a root, and φερω, to bear, in allusion to the numerous roots which are emitted by the seeds, which vegetate among the branches of the tree while yet adhering to their footstalk. This is the common Mangrove, which covers immense tracts of coast within the tropics, rooting and vegetating even as far as low water mark.

1079. *Garcinia.* So named in honor of Laurent Garcin, M. D., F. R. S., who travelled into the East Indies. *Mangostans* is the Malayan name. This tree bears a fruit, which in the East Indies ranks with that of the pine-apple. It rises with a taper stem, sending out many branches, not unlike a fir-tree, with oval leaves, seven or eight inches long. The flower is like that of a single rose; the fruit round, the size of a middling orange; the shell is like that of the pomegranate, the inside of a rose color, divided by thin partitions, as in oranges, in which the seeds are lodged, surrounded by a soft juicy pulp, of a delicious flavor, partaking of the strawberry and the grape, and is esteemed one of the richest fruits in the world. It is a native of the Molucca islands, whence it has been transplanted to Java and Malacca. The head of the tree is in the form of a parabola, so fine and regular, and the leaves so beautiful, that it is looked upon in Batavia as the tree most proper for adorning a garden, and affording an agreeable shade. It was introduced to England in 1789. According to Dr. Garcin, (*Phil. Trans.*) " it is esteemed the most delicious of the East Indian fruits, and a

6584 Leaves lanceolate, Peduncles 1-flowered very long horizontal axillary
6585 Leaves elliptical acute, Peduncles 1-flowered nodding terminal

6586 Calyxes two, Leaves with three nerves finely striated across beneath

6587 Leaves ovate-lanceolate smooth, Flowers terminal in panicled racemes

6588 Leaves stalked alternate obovate obtuse coriaceous entire smooth

6589 Leaves acute, Fruit subulate-clavate

6590 Leaves ovate, Peduncles 1-flowered

6591 Leaves alternate stalked ovate entire smooth veiny

6592 Leaves ovate acuminate, Veins hairy beneath, Wings of the fruit equal
6593 Lvs. obl. ovate obtusely pointed green on both sides very soft beneath, Wings of fruit alternately larger

6594 Leaves all ovate, Stem climbing
6595 Lower leaves rounded: upper ovate-lanceolate, Stem sarmentose

6596 Branches at end pubescent, Leaves cuneate oval, Flowers axillary

6597 Leaves opposite evergreen ovate shining serrated

6598 Leaves oblong obtuse shining, Racemes terminal

and Miscellaneous Particulars.

great deal of it may be eaten without any inconvenience; it is the only fruit which sick people are allowed to eat without scruple. It is given with safety in almost every disorder; and we are told that Dr. Solander, in the last stage of a putrid fever in Batavia, found himself insensibly recovering by sucking this delicious and refreshing fruit. The pulp has a most happy mixture of the tart and sweet, and is no less salutary than pleasant. It is propagated by ripe cuttings in sand in moist heat. But the plant rarely survives long after its importation.

1080. *Grangeria.* Named after N. Granger, a traveller in Egypt, Persia, &c. who died at Bassora in 1733. His voyage into Egypt was published in 1745. This is a tree the size of an oak, with alternate ovate entire leaves. The flowers are small, in small terminal and axillary racemes.

1081. *Halesia.* So named by Ellis, in honor of the learned and venerable Stephen Hales, D. D., F. R. S., author of Vegetable Staticks, 1727. The species are very ornamental shrubs, valuable for blossoming early in the season. The flowers hang in small bunches all along the branches, each bud producing from four to eight or nine; they appear before the leaves, are of a pure snowy whiteness, and last for two or three weeks; they are succeeded by pretty large winged juiceless drupes, hanging likewise in bunches. The leaves of H. diptera are six times the size of those of H. tetraptera, and the fruit has two large wings and two minute ones. They are propagated by cuttings of the roots.

1082. *Decumaria.* Derived from *decem*, ten, all the parts of fructification answering to the number 10. It is commonly propagated by layers, but will grow by cuttings in sand under a hand-glass.

1083. *Eurya.* A name of Thunberg's, supposed to have been formed from ευρυς, broad; its application no one has been able to discover. The Eurya chinensis is a little evergreen bush, bearing many whitish flowers on the under side of the branches and hidden by the leaves. It is easily propagated by cuttings.

1084. *Aristotelia.* After the celebrated ancient philosopher and naturalist Aristotle. Macqui is the name of this shrub in Chili. It grows freely in a sheltered situation; but its flowers are of little beauty. They are succeeded by small berries of a purple or black color, slightly acid and eatable: the inhabitants of Chili make a wine from them, which they give in fevers, and for curing the plague. It is increased by layers or ripened cuttings.

1085. *Canella.* A name given by Murray, on account of the resemblance between its wood and the aromatic flavor of *Canella*, Cinnamon. This tree rises very straight, from ten to fifty feet in height. The branches are erect, not spreading, and only at the top of the tree; furnished with petiolated leaves of a dark green color, thick, and shining like those of the laurel, and emitting a similar odor. The flowers, which exhale a powerful aromatic perfume, are small, seldom open, and in bunches. The inner bark of the branches is freed from the cuticle, and dried in the shade. This bark is stimulant, and slightly tonic. It is a useful adjunct to bitters in some cases of dyspepsia and atonic gout; but it is employed chiefly on account of its flavor, and to correct the griping quality of the resinous cathartics. It is said to prove useful in scurvy (*London Dispensatory*, 207.)

History, Use, Propagation, Culture,

1086. *Cratæva.* In honor of Cratævus, a Greek botanist and contemporary of Hippocrates. C. Tapia, an American name, produces a fruit about the size of an orange, with a mealy pulp and a strong smell of garlic, which is communicated to the animals that feed on it. All the species prefer a rich loamy soil, and may be increased by cuttings in sand under a hand-glass.

1087. *Triumfetta.* So named by Plumier, in memory of Giov. Battista Triumfetti, prefect of the botanic garden at Rome, author of Hortus Romanus, 1681, and other works. T. semitriloba has a tough strong bark which serves for ropes and other conveniences of that kind in the inland parts of the West Indies. The whole plant is mucilaginous and emollient. Cuttings root in sand under a hand-glass. All the species are uninteresting weed-like shrubs of tropical countries.

1088. *Peganum.* Πηγανον was the Greek name of the rue, which the modern plant resembles. Harmala is the Arabic name (*kharmel*) of the species so called. The species are of easy culture and propagation in any light soil.

1089. *Hudsonia.* So named by Linnæus, in honor of William Hudson, apothecary of London, F. R. S., and author of Flora Anglica, 1762 and 1778, octavo. It is a heath-like plant which grows in peat soil, and young cuttings are rooted in sand under a bell-glass. It is extremely rare in gardens.

1090. *Nitraria.* So named by Schreber, who first found it in Siberia near the nitre works, with other saline vegetables. This is a curious thorny shrub, peculiar to the salt deserts of Siberia. Pallas informs us, that the berries, though saltish and insipid, are eaten in the Caspian desert, but in that arid soil they are almost the only luxury. Camels feed on the twigs. Linnæus had the shrub twenty years before it flowered in Sweden;

6599 Unarmed, Leaves entire, Flowers gynandrous
6600 Leaflets ovate acuminate, Petals ovate roundish obtuse with globose ovaries
6601 Stem twining, Cor. regular, Petals very long wavy, Peduncles capitate-racemose

6602 Leaves emarginate at base, Flowers without calyx
6603 Leaves entire at base undivided
6604 Leaves half three lobed, Flowers complete
6605 Leaves subcordate ovate entire serrated rather hairy: the floral ones lanceolate, Branches hairy
6606 Leaves ovate undivided rarely lobed
6607 Leaves rhomboid: the upper lanceolate ovate, Flowers complete
6608 Leaves ovate cordate entire unequally serrated acuminate downy glandular at base, Fl. complete
6609 Leaves ovate cordate 7-nerved acuminate serrate hairy, Flowers clustered
6610 Leaves oblong serrate 5-nerved softly hairy, Fl. terminal clustered

6611 Leaves multifid, Stem herbaceous
6612 Leaves oblong acute, Stem herbaceous

6613 Leaves subulate acerose hairy, Calyx erect pubescent

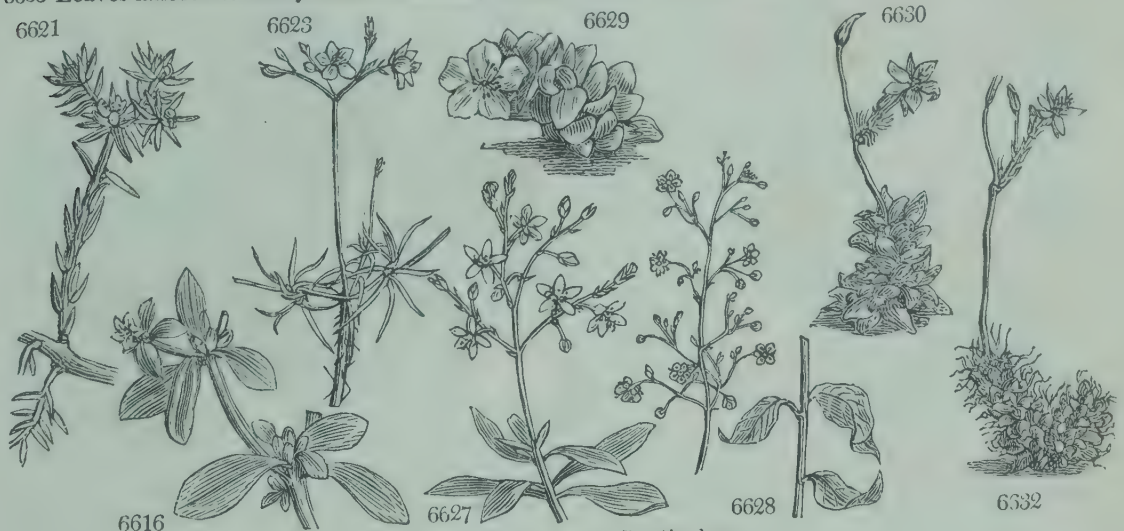
6614 Leaves entire obtuse

6615 Leaves wedge-shaped fleshy, Fl. sessile, Stem and branches nearly erect
6616 Leaves wedge-shaped fleshy, Fl. sessile, Branches prostrate
6617 Much branched prostrate, Leaves wedge-shaped minute fleshy, Fl. on long stalks and sessile
6618 Leaves subulate alternate hairy at the axillæ, Flowers sessile terminal
6619 Bractes 4, Flowers 4-fid, Joints of the stem hairy
6620 Leaves elliptical fleshy flat, Joints hairy, Flowers sessile terminal
6621 Leaves subulate, Cal. hairy, Involucre many-leaved, Flowers about 3, Petals retuse
6622 Axils hairy, Leaves obversely oblong, Involucre 8-leaved

6623 Leaves cylindrical fleshy, Corymbs terminal stalked
6624 Leaves linear oblong ciliated, Flowers solitary
6625 Leaves flat chann. wedge-shaped emarg. mucronate, Raceme simple with a 3-cornered peduncle
6626 Leaves flat obovate mucronate, Corymb long, Peduncle 3-cornered
6627 Leaves ovate flat, Panicle terminal, Peduncle dichotomous
6628 Leaves lanc. ovate sessile opposite, Panicle branched

6629 Leaves ovate difform smooth green, Peduncles round long panicled

6630 Leaves ovate acuminate difform green shining cobwebbed, Raceme simple, Peduncles round long
6631 Leaves ovate acuminate difform shining cobwebbed dark-red, Rac. simple, Pedunc. very long
6632 Leaves imbricated expanded dark-green cobwebbed rugose above, Threads axillary longer than leaves
6633 Leaves lanceolate fleshy convex beneath, Scape leafy short 1-flowered



and Miscellaneous Particulars.

and during ten years having in vain tried to make it flower in the garden at Upsal, he at length succeeded by watering the plant with salt water; it flowered, however, at Gottingen without this assistance. Murray expresses a surprise that it has not been used in its native soil for making soda: but perhaps it does not grow in sufficient quantity, or there may be an ample harvest in that salt region of plants that answer the same purpose.

In this country it thrives in sandy loam with a little salt put round it, and is increased by layers, or cuttings in sand under a hand-glass.

1091. *Portulaca.* An ancient name of unknown origin. The species are succulents of the easiest culture. P. sativa and oleracea were formerly cultivated as potherbs, salads, for garnishings and pickling, though now little used for any of these purposes.

1092. *Talinum.* One of those names invented by Adanson, which probably were the mere creations of that botanist's erratic brain. This is a succulent genus allied in habits to Portulaca, and of the easiest culture.

1393. *Anacampseros.* Αναζαμψεως was the name of a plant, to which the ancients attributed the quality of restoring the passion of love, for which purpose it was used in philtres and incantations: from αναζαπτω, to return, and ερως, love. The species are succulents, and grow freely in a sandy loam mixed with a little lime rubbish, and require but little water. Cuttings root readily, but should be laid to dry a few days before being planted. Leaves taken off close to the plants, and laid to dry a few days, and then planted, will root, and shoot out young plants at their base.

History, Use, Propagation, Culture,

1094. *Lythrum.* From λυθρον, black blood, in allusion to the color of the flowers. L. Salicaria (willow-like, from *Salix*) although a common British plant, is considered a handsome border flower, and several varieties, differing chiefly in size, are in cultivation. The whole plant is astringent, and has been used in medicine and tanning.

1095. *Nesæa.* Plants formerly referred to Lythrum, from which they seem to be satisfactorily distinguished.

1096. *Heimia.* Named by Link, in honor of Dr. Heim, a celebrated Berlin physician A beautiful stove shrub with fine spikes of yellow flowers.

1097. *Cuphea.* From κυφος, curved, in reference to the form of its capsule. Pretty herbaceous or shrubby plants, resembling Lythrum in aspect. C. Melvilla is a very handsome stove shrub resembling Bouvardia coccinea.

1098. *Kleinhofia.* So named by Linnæus, after Kleinhoff, formerly director of the botanic garden in Java. The leaves when bruised smell like violets; the flowers appear the greater part of the year, and the tree is seldom without fruit in all its different stages. Cuttings root in sand under a hand-glass.

1099. *Callicoma.* From καλος, beautiful, and κομη, hair, in allusion to the tufted yellow heads of flowers, for which the plant is remarkable. Ripened cuttings root in sand under a hand-glass.

1100. *Heliocarpus.* From ἡλιος, the sun, and καρπος, fruit. The valves of its round and elegantly ciliated capsule resemble a little sun surrounded by its rays. Cuttings root in sand under a hand-glass; and Miller found the seeds to vegetate after being kept ten years.

1101. *Agrimonia.* A corruption of the word *Argemone*, by which name the ancients distinguished a plant reputed useful in cataract of the eye, which in Greek was termed *argema*. A. Eupatoria was formerly regarded as a remedy of much importance as a tonic and deobstruent; but though still retained in the London Materia Medica, is seldom or never prescribed. The root in spring is sweet scented, and the flowers fresh

6634 Leaves opp. cordate lanceolate, Flowers spiked 12-androus

and Miscellaneous Particulars.

gathered smell like apricots. When the plant is coming into flower it will dye wool a full nankeen color, and gathered in September a darker yellow. It has been used for dressing leather. Sheep and goats eat it, but kine, horses, and swine refuse it.

1102. *Reseda.* From *resedo*, to calm, to appease. The Latins thought it useful as a topical application in external bruises. R. Luteola, a diminutive of *lutea*, yellow, is used by dyers, especially in France. (Chaptal's Chimie appliqué à l'Agriculture, &c.) It affords a most beautiful yellow dye for cotton, woollen, mohair, silk and linen. Blue cloths are dipped in a decoction of it, in order to become green. The yellow color of the paint called Dutch Pink, is obtained from this plant. The entire plant, when it is about flowering, is pulled up and employed both fresh and dried. Mr. Swayne observes, that it is one of the first plants which grow on the rubbish thrown out of coal pits. It flowers in June and July. The root and bottom leaves are formed from the fallen seeds before winter; and thus it happens in this, as in many other cases, that the wild plant is biennial, whilst the cultivated plant, growing from seeds sown in the spring, is annual. It is an observation of Linnæus's, that the nodding spike of flowers follows the course of the sun, even when the sky is covered; pointing towards the east in a morning, to the south at noon, westward in the afternoon, and to the north at night.

R. odorata is a well known and universal favorite. The flowers are highly odoriferous, and there are very few to whom this odor is offensive. The plant is in great demand in London for rooms and placing in balconies, and forms for these purposes an extensive article of culture among the florists and market gardeners. The plants are in many cases sown and transplanted into pots, three or four plants to a pot four inches in diameter. To obtain plants for blowing from December to February, a sowing should be made in July in the open ground, and the plants potted in September. The crop for March, April, and May, should be sown not later than the twenty-fifth of August, the plants from this sowing will not suffer by exposure to rain, whilst they are young; they must, however, be protected from early frosts, like the winter crop; they are to

History, Use, Propagation, Culture,

be thinned in November, leaving not more than eight or ten plants in each pot; and at the same time, the pots being sunk about three or four inches in some old tan or coal ashes, should be covered with a frame, which it is best to place fronting the west: for then the lights may be left open in the evening, to catch the sun whenever it sets clear. The third, or spring crop, should be sown in pots, not later than the twenty-fifth of February; these must be placed in a frame, on a gentle heat, and as the heat declines the pots must be let down three or four inches into the dung-bed, which will keep the roots moist, and prevent their leaves turning brown, from the heat of the sun, in April and May. The plants thus obtained, will be in perfection by the end of May, and be ready to succeed those raised by the autumnal sowing. (*Rishon in Hort. Trans.* ii. 372.)

R. odorata frutescens, if left to itself, hardly appears a distinct variety, but trained against a wall or to a stick it, and also the common mignonette, may be made to assume a frutescent character. According to Sabine, the tree mignonette is to be propagated from seeds sown in spring; it may also be increased by cuttings, which will readily strike. The young plants should be put singly into small pots, and brought forward by heat, that of a gentle hot-bed being preferable, but they will grow well without artificial heat. As they advance, they must be tied to a stick; taking care to prevent the growth of the smaller side shoots, by pinching them off, but allowing the leaves of the main stem to remain on for a time to support and strengthen it. When they have attained the height of about ten inches or more, according to the fancy of the cultivator, the shoots must be suffered to extend themselves from the top, but must be occasionally stopped at the ends, to force them to form a bushy head, which by the autumn will be eight or nine inches in diameter, and covered with bloom. Whilst the plants are attaining their proper size, they should be shifted progressively into larger pots, and may ultimately be left in those of about six inches in diameter at top. (*Hort. Trans.* iii. 181.)

Mr. Lindley's theory of the nature of the inflorescence of this genus being remarkable, and only explained in his Collectanea Botanica, which is in few hands, it is here transcribed entire. "The usual idea of the flower of Reseda has been, that it is furnished with a calyx of a variable number of divisions, with as many petals, producing from their surface certain anomalous appendages, and with an ovary and stamens inserted on a great fleshy body, called nectary by Linnæan botanists, squama by others, and raised to the rank of a distinct organ by M. Mirbel, under the name of Gynophore. To us, however, it has always appeared, that this could by no means be the real structure of the plant, and that by a slight alteration of terms it not only might be much more satisfactorily explained, but its real affinity ascertained with some degree of probability. For even allowing for a moment an analogy between the nectary of this plant and the discus of others, particularly of some Tiliaceæ, there is still a great difficulty remaining to be overcome in the anomalous structure of the supposed petals, of which we can imagine no probable explanation. We are therefore of opinion, that a much more natural mode of understanding Reseda is to consider it as having compound flowers; taking the calyx of authors for an involucrum, their petals for neutral florets, and their nectary for the calyx of a fertile

6660 Leaves lanceolate wavy hairy
6661 Leaves linear toothed at base, Styles 4
6662 Leaves linear entire, Styles 4, Barren florets 2
6663 Leaves linear entire, Fl. trigynous, Fruit clavate, Stem twiggy
6664 Leaves lanceolate entire, Fruit stellate
6665 Nearly related to R. luteola, but the leaves are not toothed at base
6666 Leaves pinnate recurved at end, Styles 4, Involucre 5-parted spreading, Stem half shrubby
6667 Leaves pinnate, Styles 4, Involucres 6-parted
6668 Branches above and younger leaves covered with large distinct blisters
6669 Leaves pinnate wavy, Styles 3 or 4
6670 Leaves bipinnatifid very rough, Flowers spiked
6671 Leaves all trifid: segments of the upper leaves linear flat; of the lower lanceol wavy, Stem quite simple
6672 Leaves linear simple or trifid, Stem erect branched, Fruit obovate
6673 Leaves all trifid: the lower pinnate
6674 Leaves entire and 3-lobed, Involucres 6-parted very large
6675 Leaves entire and 3-lobed, Involucres shorter than florets
6676 Leaves entire and 3-lobed, Involucres as long as florets

§ 1. *Stem thick, fleshy, naked, or with a few leaves, Flowers dispersed.*
* *Prickly.*

6677 Fleshy prickly compressed channelled inflexed at end, Prickles twin diverging
6678 Naked erect prickly triangular jointed, Branches erect somewhat channelled
6679 Prickly nearly naked triangular jointed, Branches spreading
6680 Naked prickly jointed with 3-cornered expanded branches obsoletely marbled with white
6681 Prickly naked nearly quadrangular, Prickles twin hooked, Fl. subsessile
6682 Prickly naked with 7 angles, Prickles solitary subulate flower-bearing
6683 Prickly naked erect with 9 angles, Prickles solitary flower-bear. ascending fuscous, Branches pendulous
6684 Prickly half naked, Angles warted with spines between, The young warts leafy
6685 Prickly naked with many angles, Prickles solitary subulate
6686 Prickly naked with many angles, Prickles twin
6687 Prickly naked with numerous simple erect 10-13-angled stems, Prickles dark
6688 Prickly half naked, Prickles twin, Angles obliquely warted leafy upwards, Leaves oblong
6689 Stem round half naked leafy upwards, Leaves lanc. linear, Peduncle 1-fl. at length spiny
6690 Prickles twin, Stem rounded or angular, Angles obliquely warted, Leaves nearly oblong
6691 Prickles twin horizontal, Stem rounded simple, Leaves oblong spatulate very large

and Miscellaneous Particulars.

floret in the middle. In support of this opinion, we may observe, firstly, that there is a difference in the time of expansion of the neutral florets, and of the stamens of the fertile one; the former being quite open, in very many capituli, before one anther of the latter has burst in a single flower. Secondly, that there is an evident analogy between the appendages of the neutral florets, and the stamens of the perfect florets; inasmuch as in Reseda odorata those of the upper sterile florets are of nearly the same number as the real stamens; because in Reseda alba, and some others, in which a union of filaments takes place in the perfect floret, there is a corresponding but more complete union of the sterile appendages; and because occasionally, in Reseda odorata, stamens are changed into bodies altogether similar to the sterile appendages, and in Reseda Phyteuma the same appearance is always assumed by the perfect stamens after the anthers have performed their functions. Thirdly, that there is an equal analogy between the calyx of the neutral florets, and that of the perfect floret; because both have a peculiar glandular margin; the same form; both produce their stamens from their surface; and because the upper edge of the calyx in sterile florets has the same relation to the axis of each particular head, as that of the perfect floret has to the axis of the whole inflorescence. In Reseda Phyteuma, which has the margin of its neutral florets rolled back, the same thing occurs in the perfect floret. Fourthly, that there is no instance of the same analogy existing between the discus and petals of other plants. We may also observe, that in Reseda Phyteuma, there is a campanulate tube to the calyx, into the upper edge of which the stamens are inserted.

"To determine the affinity of Reseda to other orders, will not be so easy as to explain its structure. One cannot avoid remarking the resemblance between its calyx and the squama of Amentaceæ and Ulmaceæ. Ficoideæ, Grossulaceæ and Cacti, on account of placentation and structure of seed, may be supposed to have a certain relation to it: as may Chenopodeæ with regard to inflorescence, absence of petals, and habit. But we are disposed to believe its real place in the system is in the neighbourhood of Euphorbiaceæ, where we have placed it in Flora Scotica. They agree with it in having the same sort of aggregation of flowers, similar habit, no corolla, and ternary division of ovarium. The insertion of their ovula is the same, as is also the direction of the radicle. They differ, however, firstly, in the presence of albumen; which yet is not entirely absorbed in Reseda till the seed is perfectly ripe, and which exists even after that time in the seed of R. alba, where it is fleshy as in Euphorbiaceæ. Secondly, in their solitary seeds; in which respect Resedaceæ may be supposed to bear the same relation to Euphorbiaceæ as Campanulaceæ do to Compositæ; or as some sections of Rubiaceæ to the others. In R. suffruticulosa the ovules appeared to be reduced to a single row, and the same is said to obtain in Ochradenus. Thirdly, in elastic dehiscence of capsule; but as this is not universal in Euphorbiaceæ, it is not, strictly speaking, an objection of importance." (*Lindley's Coll. Bot.*)

1103. *Euphorbia.* Euphorbus was physician to Juba, king of Mauritania, and first used this plant in medicine. This is a genus of grotesque and curious plants, few of them of either beauty or use, and most of

History, Use, Propagation, Culture,

the annuals poisonous weeds. One species (E. edulis), not yet introduced, is said to be used as a pot-herb in Cochin China; one (E. punicea) is a very splendid plant, and the E. officinarum, and one or two other species gathered along with it, are used in medicine. They are all milky, mostly herbaceous, several however shrubby, upright for the most part, very few of them creeping; some are leafless, but most of them are leafy. Stems angular or tubercled, or more frequently cylindric or columnar; unarmed, or in the angular sorts resembling the upright Cactuses, and armed with prickles, which are either solitary or in pairs, placed in a single row on the top of the ridges. Such as have leaves have them simple, most frequently alternate and naked; in some sorts, however, they are opposite, and are then commonly attended with stipuies, and in a few they are placed by threes in whorls. Peduncles in the leafless sorts naked, bearing from one to three flowers; in the leafy ones axillary, but more frequently from two to five or more in a terminating umbel; each some-

6692 Prickly elliptical obtuse furrowed, Prickles subsolitary, Peduncles 3-flowered
6693 Warts very large green downy at end, Spines about 4 strong black at end
6694 Simple rounded obovate with warts woolly at end [than the rest
6695 Columnar, Warts small numerous with many small spines between, Two spines in each cluster longer

** *Unarmed.*

6696 Unarmed globose with many angles
6697 Unarmed imbricated, Warts with one leaf, Flowers somewhat stalked, Divisions palmate
6698 Stem closely tessellated with warts upwards thickly branched
6699 Unarmed imbricated with warts bearing a linear leaf
6700 Unarmed with round procumbent branches, Warts 4-cornered
6701 Unarmed imbricated, Warts with a roundish leaflet, Fl. term. solitary sessile with palmate segments
6702 Unarmed imbricated, Warts with a lanceolate leaflet, Fl. stalked with entire segments
6703 Unarmed imbricated capitate, Warts rhomboid with lanceolate stalked leaves, Segm. of flower entire
6704 Unarmed half naked shrubby filiform flaccid, Leaves alternate
6705 Warts large imbricated hooked at end: the upper having an oval leaflet at length withering
6706 Unarmed warted, Warts with a deciduous leaf, Pedunc. solitary or 3 terminal 1-flowered
6707 Unarmed naked leafless branched, Branches square, Fl. solitary terminal
6708 Unarmed shrubby upright, Head terminal, Leaves lanceolate smooth glaucous
6709 Unarmed half naked shrubby filiform erect, Branches spreading regularly clustered

§ 2. *Stem uniform, shrubby, upright, Flowers scattered or aggregate, not in umbels.*

6710 Unarmed, Leaves lanceolate clustered entire, Umbel terminal sessile, Involucre connate colored
6711 Unarmed shrubby upright, Umbel 5-fid term. Invol. oblong, Leaves lanc. smooth
6712 Unarmed shrubby, Leaves oblong alternate distichous, Bractes persistent
6713 Unarmed shrubby naked, Branches rounded effuse dependent jointed
6714 Umbel multifid dichotomous, Invol. subcordate: the first 3-leaved
6715 Unarmed, Leaves panduriform ovate, Fl. term. suberect, Invol. colored
6716 Villous, Leaves with long stalks alternate broadly ovate repand-toothed, Stem erect striated
6717 Leaves opp. minute stalked obovate entire, Two glands on the stem at the base of petioles
6718 Unarmed shrubby, Leaves ovate entire, Cyme axillary naked
6719 Leaves opp. subcordate stalked emarginate entire, Stem shrubby
6720 Stalks whorled longer than the orbicular leaf, Fl. solitary, Stem unarmed naked
6721 Leaves scattered lanceolate acute smooth, Pedunc. dichotomous, Caps. muricate
6722 Unarmed shrubby, Leaves scattered lanc. mucron. Fl. solitary term. with a 3-leaved invol. Caps. muricate
6723 Leaves oval entire wavy edged with white, Caps. smooth, Stem hairy
6724 Dichotomous, Leaves ovate serrate acute villous, Fl. solitary, Upper dichotomies cymose

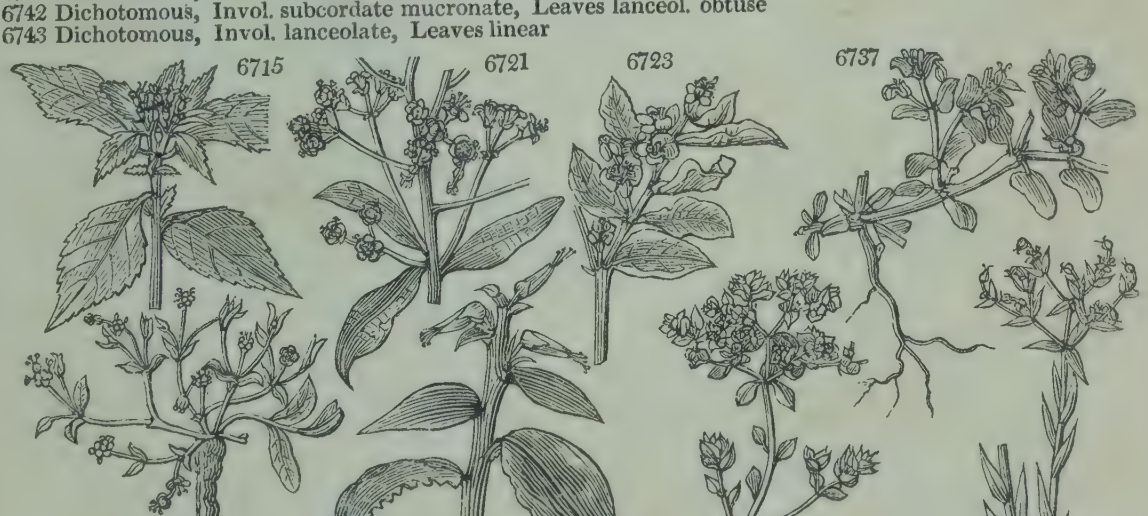
§ 3. *Dichotomous, herbaceous, Flowers solitary or aggregate, not umbelled.*

6725 Unarmed branched, Leaves subcordate entire shorter than their stalk, Fl. solitary
6726 Dwarf hairy, Leaves opp. oval toothed, Flowers clustered at the end of branches
6727 Dichotomous, Leaves serrate oval-obl. smooth, Corymbs terminal, Branches divaricate
6728 Dichotomous, Leaves ovate obl. acute at each end smooth stalked entire, Capsules smooth
6729 Dichotomous, Leaves oval obsol. serrated, Pedunc. axill. 3-flowered, Stems diffuse smooth
6730 Dichotomous diffuse, Lvs. obov. oblique somewhat cord. at base toothletted at end, Pedunc. 1-fl. axillary
6731 Dichotomous, Leaves serrate oblong hairy, Fl. axill. solitary, Branches spreading
6732 Dichotomous, Leaves ovate hairy stalked entire, Pedunc. axill. 1-fl. Caps. smooth
6733 Dichotomous, Leaves serrate oval oblong, Pedunc. 2-headed axillary, Stem erect
6734 Dichotomous, Leaves subcrenate linear, Fl. fascicled term. Stem erect
6735 Dichotomous, Leaves serrate oval-obl. Heads axill. clustered subsessile, Stems procumbent
6736 Dichotomous, Leaves crenulate roundish smooth, Fl. solitary axill. Stems procumbent
6737 Dichotomous, Leaves entire half cordate, Fl. solitary axillary, Stems procumbent
6738 Leaves opp. entire lanceolate obtuse, Fl. solitary axillary, Stems procumbent
6739 Dichotomous, Leaves entire lanceolate, Peduncles axillary 1-fl. as long as leaves, Stem erect
6740 Branches alternate dichotomous channelled filiform, Leaves ovate stalked pubescent

§ 4. *Flowers umbelled with an involucre.*

* *Umbel trifid.*

6741 Dichotomous, Invol. ovate, Leaves entire obovate stalked
6742 Dichotomous, Invol. subcordate mucronate, Leaves lanceol. obtuse
6743 Dichotomous, Invol. lanceolate, Leaves linear



and Miscellaneous Particulars.

times in a many-flowered head, but more often dichotomous, trichotomous, or even tetrachotomous, with single flowers between the divisions at the base and in the forkings; having bractes in number the same with the peduncles, forming a sort of involucre. The juice of every species of Spurge is so acrid that it corrodes and ulcerates the body wherever it is applied; so that it is seldom used internally. Externally it is dropped on warts or corns to remove them, and in the hollow of a decayed tooth, to remove the pain by destroying the nerve, or it is rubbed behind the ears to give relief in the tooth-ache by blistering.

E. officinarum, and also antiquorum and canariensis, furnish the Euphorbium of the Materia Medica. In the lower regions of Mount Atlas, the inhabitants collect the concreted gum resin, which they call *furbiune*, in September. It is obtained by making slight incisions in the branches of the plant with a knife, from which a milk-like juice exudes, and forms into tears of an oblong or roundish form. The quantity yielded is so

History, Use, Propagation, Culture,

considerable, that the plants are cut once only in four years; the supply then obtained being sufficient for that space of time for all Europe. The recent juice is so corrosive as to erode the skin wherever it touches; and the people who gather the gum are obliged to tie a cloth over their mouth and nostrils, to protect them from the acrid dust of the withered branches, which induces the most violent sneezing. It is inodorous; and, when first chewed, has little taste, but it soon gives a very acrid burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportable. Euphorbium possesses powerful cathartic, emetic, errhine, and rabefacient properties. It has been given as a hydragogue in dropsies; but, owing to the violence of its effects, its internal use is now exploded: neither as an errhine can it be used alone, for it occasions so

6744 Dichotomous, Umbel trifid, Involucre broad obovate, Leaves entire obovate spatulate on long stalks
6745 Dichotomous, Leaves lanceolate obovate serrate, Involucre cordate, Caps. warted

6747 Umbel subtrifid, Leaves mucronate, Cauline spatulate lanc. Involucre ovate, Caps. smooth

** *Umbel 4 or 5-fid.*

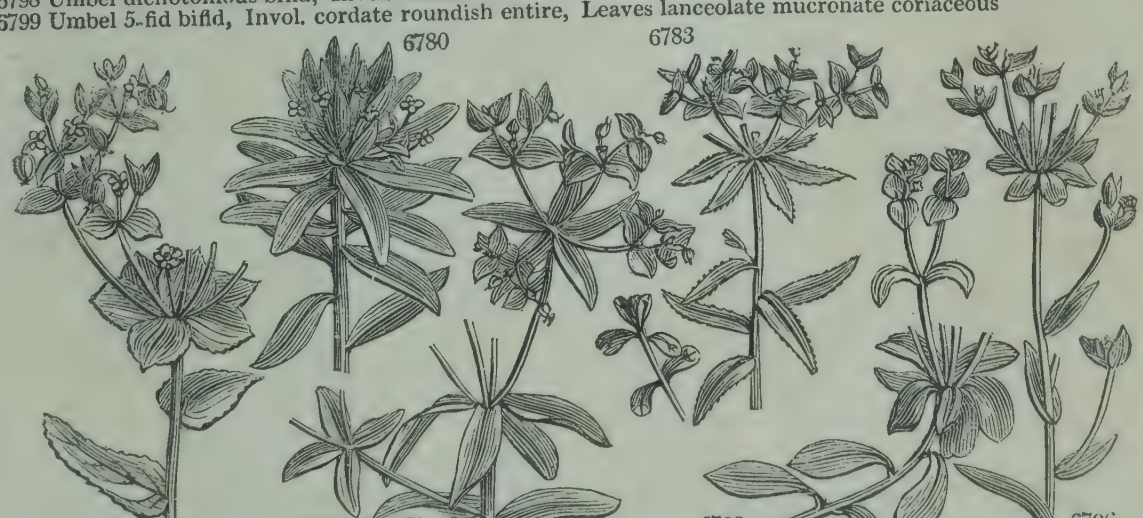
6748 Umbel 4-fid dichotomous, Leaves opposite entire
6749 Umbel 4-fid trifid, Involucre ovate acute, Leaves lanc.: lower spatulate
6750 Umbel 4-fid dichotomous, Involucre obtuse, Leaves altern. lin. cuneate emarginate mucron. Stem diffuse
6751 Umbel 4-fid bifid, Involucre reniform: the first obcordate
6752 Umbel 4 or 5-fid twice dichotomous, First involucre oblong: upper rhomboid-roundish, Leaves lin. lanceol.
6753 Umbel 5-cleft bifid, Involucre ovate, Leaves linear erect
6754 Umbel 5-cleft simple, Involucre ovate: first 3-leaved, Leaves oblong entire
6755 Umbel 5-cleft bifid, Upper leaves rounded obovate serrulate mucronate: lower lanc. reflexed
6756 Umbel 5-cleft bifid, Involucre ovate toothletted, Leaves entire lanc. oblong villous beneath
6757 Umbel 5-cleft bifid, Involucre subovate toothletted, Leaves lanc. obtuse, Caps. warted hairy
6758 Umbel 5-cleft bifid, Rays nodding, Involucre ovate entire, Leaves lanc. acute, Caps. warted smooth
6759 Umbel 5-cleft bifid, Involucre ovate mucronate, Leaves lanc.: the lower involute imbricated downwards
6760 Umbel 5-cleft dichotomous, Involucre subcordate concave, Leaves lin. lanc. acute smooth spreading
6761 Umbel 5-cleft bifid, Involucre cordate reniform, Leaves imbricated upwards

6762 Branches filiform, Leaves numerous linear oblong retuse. Rib mucronate, Fl. solitary terminal
6763 Umbel 5-cleft dichotomous, Leaves and involucre linear lanceolate acute
6764 Umbel 5-cleft dichotomous, Involucre ovate lanceolate mucronate, Lower leaves setaceous
6765 Umbel 5-cleft dichotomous, Involucre cordate acute, Leaves lin. lanceolate: the upper broadest
6766 Umbel multifid double, Involucre subcordate, Leaves linear
6767 Umbel multifid clustered, Involucre subcordate, Leaves numerous close very narrow
6768 Umbel multifid dichotomous, Involucre half orbicular cordate, Sterile branches many, Lvs. lin. lanc. obtuse
6769 Umbel 5-cleft bifid, Involucre cordate mucronate, Leaves oblong
6770 Umbel 5-cleft bifid, Involucre half orbic. cordate submucronate, Leaves linear imbricated backwards
6771 Umbel 5-cleft bifid dichotomous, Involucre obovate, Leaves cuneiform serrate smooth, Caps. smooth
6772 Umbel 5-cleft trifid dichotomous, Involucre 2-leaved reniform, Leaves amplexicaul. cordate serrate
6773 Umbel multifid bifid, Involucre orbicular, Leaves linear lanc. villous
6774 Umbel 5-cleft trifid, Involucre oval acuminate colored, Caps. smooth, Leaves glaucous beneath
6775 Umbel 5-cleft trifid, Involucre ovate, Leaves lanc. serrulate villous, Caps. warted
6776 Umbel 5-cleft trifid dichotomous, Involucre and leaves oblong obtuse, Divisions of involucre white
6777 Umbel 4-fid bifid, Involucre obovate, Leaves spatulate lanc. entire reflexed, Stem half shrubby branched
6778 Umbel 5-cleft trifid dichotomous, Involucre ovate, Leaves lanceolate, Caps. woolly
6779 Naked smooth, Umbel 5-cleft bifid, Leaves sessile lanceolate veiny on each side
6780 Umbel 5-cleft trifid bifid, Involucre ovate entire, Leaves lanc. hairy subserrulate at end
6781 Umbel 5-cleft 4-fid dichotomous, Involucre roundish acute, Leaves lanceolate
6782 Umbel 5-cleft 3-fid dichotomous, Involucre with a hairy keel, Leaves serrate lanceolate, Caps. warted

6783 Umbel 5-cleft 3-fid dichotomous, Involucre lanceolate, Leaves lanc. toothed pubescent, Caps. smooth warted
6784 Umbel multifid bifid, Involucre subcordate 2-horned, Barren branches with 1-shaped leaves
6785 Umbel 5-fid bifid, Involucre perfoliate cordate acute, Leaves lanc. entire
6786 Leaves lanc. obtuse, Umbel 5-fid dichotomous, Involucre ovate obtuse 2-horned
6787 Umbel 5-fid bifid, Leaves spatulate lanc. mucronate coriaceous serrulate, Involucre ovate, Caps. smooth
6788 Leaves obversely obl. Involucre oblong and ovate serrulate at end, Umbel 5-fid dichotom. Caps. keeled twice
6789 Leaves linear with long points entire smooth, Umbel 5-fid bifid, Involucre lanceolate, Leaves 2-horned
6790 Umbel trifid dichotomous, Leaves serrate somewhat hairy: lower spatulate; upper and involucre spatulate
6791 Upper branches hairy, Leaves smooth lanceolate, Caps. warted, Involucre cordate
6792 Umbel sub-5-fid bifid, Caul. leaves and involucre cordate lanceolate obtuse toothletted, Involucre reniform
6793 Leaves lanceolate, Umbel 5-fid, Involucre oval obtuse, Caps. ramentaceous hairy

*** *Umbel 6-many-fid.*

6794 Umbel multifid dichotomous, Involucre roundish entire, Branches none
6795 Umbel multifid dichotomous, Involucre subcordate, Branches sterile, Leaves setaceous, Cauline lanceolate
6796 Umbel multifid bifid, Involucre subtriangular, Leaves sessile erect, Caps. rough
6797 Umbel 8-fid bifid, Involucre subovate, Leaves spatulate spreading fleshy mucronate rough at edge
6798 Umbel dichotomous bifid, Involucre roundish mucronate, Leaves obovate imbricate serrulate
6799 Umbel 5-fid bifid, Involucre cordate roundish entire, Leaves lanceolate mucronate coriaceous



and Miscellaneous Particulars.

much inflammation as to produce hæmorrhage from the nostrils, and swells the integuments of the head. When properly diluted, however, with starch or any other inert powder, and cautiously used, it is an effectual and excellent errhine in lethargy, deafness, palsy, amaurosis, and similar cases. (*London Dispensatory*, 298.)

E. Lathyris has seeds about the size and color of caper buds, and in Paris is sometimes substituted for that pickle. Eaten in any quantity they must prove highly deleterious.

E. helioscopia has a peculiarly acrid milky juice, which is often applied by country people to eat off warts; but should be used with caution where the parts are tender. According to Linnæus, sheep eat it, and are purged by it, and their flesh acquires a bad taste; but this is not the case with cows.

History, Use, Propagation, Culture,

Many of the stove species of this genus are succulents, and will thrive the better if a little lime rubbish be added to their sandy loam. They are somewhat difficult to strike. Sweet says, "The way I have succeeded best, is to stick them in the tan amongst the pots in a good heat, and not cover them with any glass." (*Bot. Cult.* 55.)

The inflorescence of this genus is not now considered to consist of twelve stamens surrounding an ovary; but almost as in Reseda, of a number of monandrous naked male florets surrounding a naked female floret. This manner of understanding Euphorbia was first indicated by Jussieu, and afterwards correctly explained by Mr. Brown.

1104. *Pedilanthus.* From πεδιλον, a slipper, and ανθος, a flower, in allusion to the form of the involucre. A genus resembling Euphorbia in properties and appearance.

1105. *Visnea.* This seems to be a blunder of the younger Linnæus for *Vismea*, which now is the name of a distinct genus, which see. Ripened cuttings root freely in sand.

6800 Umbel multifid 3-fid bifid, Involucre ovate, Leaves lanceolate, Branches barren
6801 Umbel multifid bifid, Involucre broadly cord. Leaves obl. emarg. smooth, Stem branched, Capsules warted

6831 Margins of leaves serrate toothed, Offsets spreading
6832 Leaves entire oblong ovate smooth stalked, Cymes spreading, Pedunc. and calyx hairy
6833 Leaves stem and petals hairy at end
6834 Leaves ciliated, Offsets short round nearly sessile, Petals 6 fringed

and Miscellaneous Particulars.

1106. *Calligonum.* From καλος, beautiful, and γονυ, a knee or joint. This plant produces, instead of leaves, curious greenish excrescences disposed in joints, which give it a remarkable appearance.

1107. *Glinus.* A name employed by Theophrastus to designate a kind of maple. This plant is, however, more like a purslane.

1108. *Blackwellia.* Named after Elizabeth Blackwell, who published an Herbal in 1735, containing figures of between two and three hundred plants, drawn and engraved by herself. Curious stove plants with pretty foliage, but inconspicuous spikes of whitish green flowers.

1109. *Gastonia.* Named by Commerson after Gaston de Bourbon, son of Henry IV. In the Isle de Bourbon it is called *Bois d'éponge.*

1110. *Sempervivum.* From *semper vivere*, to live for ever, in allusion to the tenacity of life common to plants of the genus. This is a succulent genus, some species of which are ornamental or singular, and others

History, Use, Propagation, Culture,

curious. S. tectorum, common on the roofs of buildings, is used by country people as an application to burns, inflammations, and ulcers, alone, in a bruised state, or mixed with cream. Linnæus informs us, that house-

Class XII. — ICOSANDRIA. Stamens many, perigynous, or inserted into the Calyx.

To gardeners this is one of the most interesting of the Linnean classes, containing a greater proportion than any other of objects which come within their observation and management. It also consists of genera for the most part naturally allied; and comprises not only the most remarkable portion of Ficoideæ, all Cacti, and the chief of the Myrtaceæ, but almost every genus of the beautiful and hardy tribes of Rosaceæ. Its characters are well defined, and depend upon the insertion of a number of distinct stamens, exceeding twenty, into the inner surface of the calyx; modifications of which organ are here found to be of more than ordinary importance in characterising the genera.

The genera are extremely natural, and have been all studied with unusual attention. Some difference of opinion exists among botanists as to the limits which ought to be assigned to them, and great diversity of nomenclature has thence arisen. "But," as has been observed by a modern author, "in a class so strictly natural as this is, greater difficulty is always to be expected in finding characters for genera, than in those of which our knowledge is more imperfect, and whose series of individuals may therefore be considered less complete." In the apple and pear tribe, Pomaceæ, where the greatest difficulty is thought to exist, we adopt Mr. Lindley's arrangement, as published in the Transactions of the Linnean Society, which we find admitted by all botanists of authority.

But if it is difficult to ascertain the definite limits of the genera of Icosandria, it is yet more perplexing to arrive at a satisfactory conclusion respecting the species of which the genera are constituted. Having all been, as long as gardens have existed, the objects of cultivation, it has happened that many individuals have, under the action of domestication, wandered so far from their original types, as to have acquired new characters for themselves, of so peculiar a kind as to have rendered it impossible at the present day to refer them with certainty to the source from which they originally sprung. To remedy this confusion, which has been thus increasing for ages, some persons have thought it necessary to distinguish the species by such artificial characters as they are now found to possess, without reference to any changes the genera may have undergone; but it has been found that no facilities of discrimination have been gained by multiplying distinctions in consideration of differences which are neither permanent or remarkable, nor connected with natural habit, but purely artificial. To others it has appeared proper to endeavour to reduce the aberrant forms which now exist to those from which, upon mature consideration, they may be presumed to have been derived, and to simplify the arrangement and discrimination of the species by confining them within their primitive limits. As we think the latter to be the most simple principles of arrangement, and as they are certainly the most philosophical, we shall here follow those authors who have adopted them.

It is usual in this class to distinguish the orders with two and three styles from that with five: but the different species vary so much in the same genus in this respect, that we have only separated the genera into those with one style, Monogynia; with two, three, or five styles, Di-Pentagynia; and with many styles, Polygynia.

Order 1. MONOGYNIA. Many perigynous Stamens. 1 Style.

§ 1. *Ovary inferior.*

1111. *Cactus.* Cal. imbricated. Petals numerous, in many rows: the inner the largest. Stigma many-cleft. Berry many-seeded.

1112. *Rhipsalis.* Cal. 3-4-parted, very short. Teeth acuminate, membranous, very fine. Berry 1-celled, pellucid. Seeds 12, in the centre.

1113. *Bartonia.* Cal. 5-cleft. Petals many. Caps. cylindrical, 1-celled at the end with 3-5 lid-like valves. Placentas 3-5, parietal, bearing seeds in a double row.

6835 Leaves ciliated, Offsets globose
6836 Leaves entire, Offsets spreading
6837 Leaves with entangled hairs, Offsets round
6838 Leaves rounded clavate clustered, Pedunc. naked 1-fl. Nects. obcordate

and Miscellaneous Particulars.

leek is a preservative to the coverings of houses in Smoland. It may easily be made to cover the whole roof of a building, whether of tiles, thatch, or wood, by sticking the offsets on with a little earth or cow dung.

1114. *Philadelphus.* Cal. 4-5-parted. Petals 4-5. Style 4-cleft. Caps. half-superior, 4-5-celled, many-seeded. Seeds with an arillus.
1115. *Leptospermum.* Cal. persistent at base, 5-cleft, half-superior. Petals 5, clawed, round, longer than stamens. Stigma capitate. Caps. depressed, 4-5-celled. Seeds angular, slender.
1116. *Fabricia.* Cal. 5-cleft, half-superior. Petals 5, sessile. Stigma capitate. Capsule many-celled. Seeds winged.
1117. *Metrosideros.* Cal. 5-cleft, half-superior. Petals 5. Stamens very long, separate. Stigma simple. Caps. 3-4-celled.
1118. *Psidium.* Cal. 5-cleft. Petals 5. Berry soft, pulpy, many-seeded. Cotyledons leafy, very small. Radicle very large, arcuate. Testa bony.
1119. *Eugenia.* Cal. 4-5-parted, superior. Petals 4-5. Fruit fleshy, 1-celled, 1-seeded. Cotyledons half-cylindrical. Radicle very small. Testa membranous.
1120. *Caryophyllus.* Cal. funnel-form. Fruit dry, 1 or 2-celled. Otherwise like Eugenia.
1121. *Myrtus.* Cal. 5-cleft. Petals 5. Berry 2 or 3-celled, many-seeded. Radicle and cotyledons distinct.
1122. *Calyptranthus.* Cal. truncate, before flowering covered with an hemispherical deciduous lid. Cor. O. Berry 1-celled, 4-seeded.
1123. *Pimenta.* Cal. 5-fid. Petals 5. Ovary 2-celled. Ovules solitary, appense. Style straight. Stigma somewhat capitate.
1124. *Olynthia.* Cal. 5-cleft. Petals 5. Stigma hooked. Berry 1-celled. Seeds angular. Embryo conferruminate.
1125. *Stravadium.* Cal. 4-cleft. Petals 4. Fruit 4-cornered, 1-seeded. Flowers in terminal racemes. Leaves alternate.
1126. *Eucalyptus.* Cal. truncate, covered with an entire deciduous lid. Cor. O. Capsule 4-celled, opening at end, many-seeded.
1127. *Punica.* Cal. 5-cleft. Petals 5. Berry many-celled, many-seeded. Seeds berried. Placentas parietal.

§ 2. *Ovary superior.*

1128. *Amygdalus.* Cal. 5-cleft. Petals 5. Drupe with a nut perforated on its surface.
1129. *Prunus.* Cal. 5-cleft. Petals 5. Drupe with a hard smooth nut.
1130. *Chrysobalanus.* Cal. 5-cleft. Petals 5. Style lateral. Drupe with a 5-furrowed, 5-valved nut.

Order 2. DI-PENTAGYNIA. Many perigynous Stamens. 2 to 5 Styles

§ 1. *Ovary inferior*

1131. *Mespilus.* Cal. 5-parted, with leafy divisions. Disk arge, honey-bearing. Styles smooth. Apple turbinate, open, 5-celled, with a bony putamen.
1132. *Cratægus.* Cal. 5-toothed. Petals spreading, orbicular. Ovary 2-5-celled. Styles smooth. Apple fleshy, oblong, closed by the teeth of the cal., or by the thickened disk. Putamen bony.
1133. *Pyrus.* Cal. 5-toothed. Petals roundish. Apple closed, 5-celled, with a cartilaginous putamen. Cells 2-seeded. Testa cartilaginous.
1134. *Cydonia.* Cal. 5-parted, with leafy divisions. Apple closed, many-seeded. Testa mucilaginous.
1135. *Photinia.* Cal. 5-toothed. Petals reflexed. Ovary half-superior, villous, 2-celled. Styles 2, smooth. Pericarp 2-celled, included in the fleshy calyx. Testa cartilaginous.
1136. *Raphiolepis.* Cal. with a funnel-shaped deciduous limb. Filaments filiform. Ovary 2-celled. Apple closed by the thickened discus, with a papery putamen. Seeds gibbous.
1137. *Eriobotrya.* Cal. woolly, bluntly 5-toothed. Petals bearded. Stamens erect, the length of teeth. Styles 5, filiform, included, hairy. Apple closed, 3-5-celled. Chalaza none. Radicle included between the bases of cotyledons.
1138. *Amelanchier.* Cal. 5-toothed. Petals lanceolate. Ovary 10-celled. Ovules solitary. Apple 3-5-celled, with a cartilaginous putamen.

1139. *Cotoneaster.* Flowers polygamous. Cal. turbinate, bluntly 5-toothed. Petals short, erect. Stamens length of teeth. Styles smooth, shorter than stamens. Achenopses parietal, included in calyx.

§ 2. *Ovary superior.*

1140. *Waldsteinia.* Cal. 10-cleft; the alternate segments smaller. Petals 5. Styles clavate, deciduous. Grains 2, obovate.
1141. *Spiræa.* Cal. spreading, 5-cleft. Petals 5. Caps. 1-celled, 2-valved, opening inwards, 1-3-seeded.
1142. *Gillenia.* Cal. infundibuliform, 5-toothed. Petals 5. Stamens very short. Capsule 5-celled.
1143. *Sesuvium.* Cal. 5-parted, colored. Petals O. Caps. ovate, 3-celled, cut round, many-seeded.
1144. *Aizoon.* Cal. 5-parted. Pet. O. Caps. 5-celled, 5-valved.

Order 3. POLYGYNIA. Stamens many, perigynous. Styles many.

1145. *Tetragonia.* Cal. 3-5-parted. Petals O. Drupe inferior, with a 3-8-celled nut.
1146. *Mesembryanthemum.* Cal. 5-cleft. Petals many, linear. Capsule turbinate, fleshy, inferior, many-seeded.
1147. *Hymenogyne.* Styles about 12, united in a delicate tube. Caps. 1-celled, many-seeded. Otherwise like Mesembryanthemum.

MONOGYNIA.

1111. CAC'TUS. *W.* Cactus. *Cacti. Sp.* 68—90.

History, Use, Propagation, Culture,

1111. *Cactus.* A name under which Theophrastus describes a spiny plant, an article of food, which grew in Sicily. This genus consists of succulent plants, permanent in duration, singular and various in structure; generally without leaves, and having the stem or branches jointed; for the most part armed with spines in bundles, with which, in many species, bristles are intermixed. These bundles of spines are placed on the top of the tubercles in the smaller melon thistle, which is tubercled all over, and produces its flowers between the tubercles. In the great melon thistle the spines are ranged in a single row on the ridge of the ribs. These are of an ovate or globular form. The torch thistle, on the contrary, are slender, rise up high, are jointed and branched; many of them are almost cylindrical, with from five to ten shallow ribs; some, however, are square or three cornered. The structure of the creeping Cereuses is the same with these, except that the stems are weak and cannot support themselves; they therefore seek support from trees, and throw out roots from the stem, like ivy. In the Indian figs the branches are jointed, and flatted like the sole of a shoe; the bundles of spines or bristles are scattered over the surface, and the flowers are produced from the edge of the extreme branches. In the Phyllanthus the branches are thinner, they are indented along the edge, and the flowers come out singly from the indentures. This seldom has any spines. Pereskia has a round stalk with leafy branches; the leaves alternate, flat, and thick; the prickles are large and stiff, and come out in bundles on the stalk and branches, chiefly at the axils; the flowers are produced several together from the axils also. In this and the Indian figs the flowers are pitcher-shaped; in the other species they are subcylindrical and longer; in Phyllanthus very long. The fruit in some of the sorts is small, like currants; but in most it is larger, and shaped like a fig, whence their name of Indian fig.

C. melocactus, the great melon thistle or Turk's cap, appears like a large fleshy green melon, with deep ribs, set all over with strong sharp thorns. When it is cut through the middle, the inside is found to be a soft, green, fleshy substance, very full of moisture. The flowers and fruit are produced in circles round the upper part of the cap. Some of those which have been brought to England, have been more than a yard in circumference, and two feet and half high including the cap. But in the West Indies there are plants near twice as large. Linnæus observes, that this plant resembles a hedge-hog in its form and spines; and on the top has a discoid, convex, villous body, from which the flowers proceed.

1148. *Rosa.* Cal. urceolate, 5-cleft, fleshy, contracted at orifice. Petals 5. Grains bony, hairy, included in the fleshy tube of calyx.
1149. *Rubus.* Cal. 5-cleft. Petals 5. Berry composed of many cohering fleshy grains. Receptacle nearly dry.
1150. *Dalibarda.* Cal. 5-cleft. Petals 5. Berry dry. Styles 5, long, deciduous.
1151. *Fragaria.* Cal. 10-cleft. Pet. 5. Grains inserted upon a fleshy deciduous receptacle.
1152. *Comarum.* Cal. 10-cleft. Petals 5, less than calyx. Receptacle ovate, spongy, persistent.
1153. *Potentilla.* Cal. 10-cleft. Petals 5. Grains rugose, roundish, naked, fixed to a small dry receptacle.
1154. *Tormentilla.* Like Potentilla, but cal. 8-cleft. Petals 4.
1155. *Geum.* Cal. 10-cleft. Sepals unequal. Petals 5. Grains generally with a jointed awn.
1156. *Kerria.* Cal. 5-cleft. Pet. 5, orbicular. Ovaries 5-8, smooth, globose. Ovules solitary. Styles filiform. Capsules globose.
1157. *Calycanthus.* Stamens unequal, deciduous; the 12 outer fertile. Grains many.
1158. *Chimonanthus.* Stamens equal, persistent; the 5 outer fertile, in maturity closing the orifice of the calyx by their united bases.
1159. *Dryas.* Cal. simple, 8-cleft. Petals 8. Grains with a hairy tail.
1160. *Coluria.* Like Sieversia, but the style jointed with the top of ovarium and deciduous, and the achenia glandular, included in the long turbinate tube of the calyx.
1161. *Sieversia.* Cal. 10-cleft. Petals 5. Stamens indefinite. Ovaries indefinite, with an ascending ovule. Styles terminal, continuous. Achenia awned with the persistent style. Embryo erect.

MONOGYNIA.

6839 Roundish covered with ovate bearded tubercles
6840 Simple clavate, Tubercles ovate with woolly spines at end, Wool shorter than spines
6841 Roundish depressed with ten angles
6842 Proliferous, Warts small cylindrical, Spines fine whitish the lowest like hairs
6843 Roundish multiplex, Warts cylindrical bearded above furrowed proliferous
6844 Roundish deeply 16-angled, Angles with a remarkable swelling below each parcel of spines
6845 Warts large very green downy at end, Spines about 4 strong expanded
6846 Simple rounded obovate, Warts woolly at end with more than 20 spines
6847 Columnar, Warts small very numerous with little spines between, 2 in each parcel much longer than rest
6848 Roundish with about 14 angles
6849 Roundish with 15 angles, Spines broad recurved numerous
6850 Oblong with many angles, Angles and spines middle-sized straight
6851 Oblong with about 20 angles, Rays of spines capillary long
6852 Depressed spheroidal with about 21 angles, Rays of spines variable the lowest very broad flat deflexed
6853 Rounded bright green with 14 angles, Ribs straight with long thick white spines

and Miscellaneous Particulars.

C. melocactus, mammillaris, and proliferus, by many thought to be but one species, grow upon the steep sides of rocks in the hottest parts of America, where they seem to be thrust out of the apertures, having little or no earth to support them: their roots shooting down into the fissures of the rocks to a considerable depth, so that it is troublesome to get the plants up. As they delight in such rocky places, they seldom live long when transplanted into a better soil. In times of great drought the cattle repair to the barren rocks where these plants grow, rip them up with their horns, tear off the outside skin, and greedily devour all the fleshy moist part. The fruit is frequently eaten by the inhabitants of the West Indies. It is about three quarters of an inch in length, of a taper form, drawing to a point at the bottom, but blunt at the top: the taste is an agreeable acid.

C. repandus has a fruit about the size and shape of a Bergamot pear, having many soft spines on the skin; the outside is a pale yellow, the inside very white, full of pulp, having a great number of small black seeds lodged in it. It frequently flowers in July, and in warm seasons will perfect its fruit, which has very little flavor in this country, but is frequently served up at table in the West India islands.

The fruit of lanuginosus and peruvianus are also occasionally eaten where they are natives.

C. grandiflorus and flagelliformis have flowers remarkable for their beauty and sweetness. C. grandiflorus, when arrived to a sufficient strength, will produce many exceeding large, beautiful, sweet scented flowers, like most of this kind, of very short duration, scarcely continuing six hours full blown: nor do the flowers ever open again when once closed. They begin to open between seven and eight of the clock in the evening, are fully blown by eleven, and by three or four in the morning they fade, and hang down quite decayed; but during their short continuance, there is scarcely any flower of greater beauty, or that makes a more magnificent appearance; for the calyx of the flower, when open, is near a foot diameter; the inside of which, being of a splendid yellow color, appears like the rays of a bright star; the outside is of a dark brown; the petals being of a pure white add to the lustre; the vast number of recurved stamens surrounding the style in the centre of the flower make a fine appearance: add to all this the fine scent of the flower, which perfumes the air to a considerable distance. There is scarce any plant which deserves a place in the hothouse so much as this, especially as it may be trained against the wall, where it will not take up any room. The usual season of its

History, Use, Propagation, Culture,

flowering is in July, and when the plants are large, many flowers will open the same night, and there will be a succession of them for several nights together. Sometimes six, eight, or ten flowers open at the same time on one plant, making a most magnificent appearance by candle-light: but none of them are succeeded here by any appearance of fruit,

C. flagelliformis produces a greater number of flowers than the foregoing sort: they come out in May, and sometimes earlier, when the season is warm. The petals are of a fine pink color both within and without; they are not so numerous, and the tube of the flower is longer than that of the other. These flowers keep open three or four days, provided the weather, or the place where the plants stand, be not too warm; and during their continuance they make a fine appearance. This sort has very slender trailing branches, which require a support: they are not jointed, nor do they extend so far as those of the other sort. Fruit sometimes succeeds the flowers, but seldom ripens.

C. triangularis, the strawberry pear, *Poirer de Chardon*, Fr., bears the best flavored fruit of any of the sorts; it is slightly acid, and at the same time sweet, pleasant, and cooling; in Martinique and other West India islands it is much esteemed.

C. opuntia, native of the country of the Opuntiani, whose chief town was Opus, in the vicinity of Phocis, though like the others a native of America, is now found growing wild on the sides of the roads between Rome and Naples and other parts of Italy, and even in the Valais. Gerarde says, it was brought from Virginia into England, and Collinson had it from Newfoundland. It was fruited in Scotland in a stove by

6854 Erect with deep furrows long with 6 distant angles
6855 Erect with deep furrows long with about 8 obtuse angles
6856 Erect with deep furrows long with 4 compressed angles
6857 Erect with deep furrows long slightly quadrangular with toothed angles
6858 Erect with deep furrows long jointed with about 5 angles
6859 Erect slender with shallow furrows jointed with 9 angles, Joints ovate, Spines as long as wool
6860 Erect slender with shallow furrows jointed with 9 angles not glaucous, Spines white; a variety of the last
6861 Erect slender with shallow furrows long with 9 obsolete angles, Spines shorter than wool
6862 Erect slender with shallow furrows long with 8 compressed wavy angles, Spines longer than wool
6863 Erect slender with shallow furrows, Branches jointed few bluntly triangular
6864 Erect slender with shallow furrows, Scarcely ang. Surface covered with variously imbric. lobed divisions
6865 Erect slender with shallow furrows black with numerous brown spines longer than the wool
6866 Erect slender with shallow furrows weak cylindrical, Surface covered with netted crossing furrows
6867 Erect rounded below long elegant with about 9 angles, Spines snow-white weak, Wool very short
6868 Erect with 18 close obtuse angles with bristly yellowish spines longer than the wool
6869 Erect with deep furrows oblong with 7 angles
6870 Creeping triangular rooting
6871 Decumbent rooting 3-cornered, Spines fascicled divaricating seven two or three lines long
6872 Creeping rooting 3-cornered with scarcely channelled angles, Spines 5-7 in stellate fascicles
6873 Creeping rooting with about 5 angles
6874 Creeping 5-cornered with subulate spines longer than the wool
6875 Creeping rooting hispid with 10 angles
6876 Creeping with 3 or 4 angles which are scarcely channelled, Spines 5-7 in stellate parcels
6877 Erect, Joints broadly ovate-oblong, Spines subulate very long blackish
6878 Erect, Joints broadly ovate-oblong, Spines subulate long yellow
6879 Erect, Joints oblong and lanceolate, Spines of various shapes brownish black
6880 Joints oblong and ovate, Spines of various shapes yellow, Fl. numerous solitary
6881 Stem rounded, Branches ovate compressed flat, Spines solitary or 3 together subulate strong
6882 Joints cuneate obovate decumbent, Spines variously shaped yellow
6883 Erect, Joints obovate roundish glaucous, Stigma 6-lobed
6884 Creeping prostrate, Joints ovate, Spines even numerous hair-shaped
6885 Erect, Joints ovate elliptical, Spines even numerous short
6886 Joints ovate oblong very thick, Spines unequal

6887 Jointed proliferous, Joints oval, Warts with a cluster of spines the length of the wool
6888 Joints ovate oblong unarmed
6889 Erect, Joints lanceolate-oblong, Clusters of spines fuscous weak with one strong white spine
6890 Erect, Joints oblong or oval, Spines numerous variable brown; one very long straw-colored
6891 Jointed proliferous, Joints ovate oblong with strong white spines longer than wool
6892 Nearly erect, Joints lanceolate with even short spines, Leaves 3 lines long
6893 Branches oblong with short soft hairs, Spines small
6894 Branches oblong scarcely spiny
6895 Joints very long slender compressed, Spines very long slender clustered white
6896 Joints oblong with numerous stiff spines of which one is very long and white at base
6897 Joints brittle cylindrical ventricose compressed much divaricating
6898 Joints brittle compressed short, Spines numerous variable white erect
6899 Jointed proliferous, Joints lanceolate-glaucous, Spines bristly longer than wool
6900 Joints brittle linear-lanceolate divaricating, Spines unequal
6901 Proliferous smooth branched ensiform compressed serrated with a central woody rib
6902 Branches ensiform compressed obovate with spreading teeth, Spines few setaceous longer than wool

and Miscellaneous Particulars.

Justice, in 1750, and recently by Braddick, near London, in the open air. This active horticulturist, having eaten with pleasure of the prickly pear in Virginia, was desirous of cultivating it here. He recollected that the plant in its wild state delighted in a dry soil, amongst rocks, near the skirts of the sunny sides of the forests; and having heard that it would stand the open air in this country, he planted it in the compost described below, placed in a sheltered situation open to the sun. "The first plant that I turned out has lived in the open ground of this country for six or seven years, during which period it has endured one exceeding hard winter, and several trying springs; and in all, except the two first years, it has never failed to ripen its fruit and seeds, so that it may be now considered decidedly acclimated. The compost used by me for growing the Cactus Opuntia, is the following: one half is carbonate of lime, for which lime-rubbish from old buildings will answer; the remaining half consists of equal portions of London clay and peat-earth, having the acid neutralised by barilla: these are intimately blended and sifted. One square yard of this compost I conceive to be sufficient for one plant, which must be placed in the middle of a small artificial hillock, raised eighteen inches above the surface of the ground, which ground should be rendered perfectly dry, if not naturally so, by under-draining. Neither the leaves, flowers, nor fruit should ever be suffered to touch the ground, but they should as constantly as they are produced be kept from the earth by placing stones, pebbles, flints, or bricks under them, in imitation of artificial rock-work." (*Hort. Trans.* ii. 238.)

C. Ficus indica is very common in Jamaica, and on it feed the wild sort of cochineal insect. The fruit is large and of a deep purple color, and when eaten dyes the urine of a bloody color.

History, Use, Propagation, Culture,

C. tuna (*tyn* the Arabic name for fig) is used as a hedge plant in Spain, South America, and the West Indies. When the island of St. Christopher was to be divided between the English and the French, three rows of the tuna were planted by common consent between the boundaries. (*Sloane.*) Sir J. E. Smith informs us, that the stamens of the flower are very irritable; and that if a feather be drawn through them, in two or three seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower.

C. cochinillifer is the species on which the cochineal insect chiefly feeds. The insect feeds on other succulent plants besides those of the Cactus genus, but this species is cultivated because least annoying by its prickles. It produces an edible fruit larger than that of C. opuntia. On the top of the fruit there grows a red flower: this when the fruit is ripe, falls down on the top of it, and covers it so that no rain or dew can wet the inside. A day or two after, the flower being scorched up by the heat of the sun, the fruit opens wide, and the inside appears full of small red insects. The Indians, when they perceive the fruit open, spread a large linen cloth, and then with sticks shake the plant, to disturb the insect, so that they take wing to be gone, but keep hovering over the plant, till by the heat they fall down dead on the cloth, where the Indians let them remain two or three days till they are dry. The cochineal plants are called by the Spaniards Toona. They are planted in the country about Guatimala, Chiape, and Guaxaca, in the kingdom of Mexico.

The difference, in point of goodness, observable in the cochineal, is entirely owing to the plant it feeds upon. The prickly pear (C. tuna) so abundant in Jamaica, is covered with the insects, but not having their proper food, they are in general diminutive, and have very little red tincture in their bodies. The delicate red colored juice of the fruit is the natural food of the insect. The exuviæ and animal salts of the insect are, from the minuteness of its parts, inseparable from the essential principles of the dye, and must diminish the brilliancy of the color: and this has put some persons upon inspissating the juice of the fruit itself. The ripe fruit is said to check fluxes by its mild restringency; it is also a powerful diuretic, and sometimes imparts a tinge to the urine.

C. pereskia, so called from the generic name of Plumier, who made this species a distinct genus, in memory of N. F. Peiresk of Aix, whose name, as Tournefort says, is his only monument, has fruit about the size of a walnut, having tufts of small leaves on it, and within a whitish mucilaginous pulp.

In our stoves, according to Sweet, "sandy loam, or loam mixed with a little brick rubbish, is the best soil for all the Cacti: the pots should be as small as the plants will allow, and well drained with potsherds. They

6903 Branched, Joints short oblong truncated
6904 Leaves elliptical fleshy, Spines about ⅛ an inch long, Buds little woolly
6905 Spines numerous variable strong, Leaves lanc. oblong with a strong rib beneath
6906 Leaves elliptical fleshy, Spines ⅛ an inch long, Buds very woolly

6907 Branches pendulous whorled round smooth naked green

6908 Branches pendulous whorled round green the younger covered with bundles of white hairs
6909 Branches round as thick as a quill, Spines scarcely any
6910 Pendulous, Branches rounded fascicled, Hairs bundled in six lines
6911 Jointed erect, Branches round and angular, Young spines in minute inconspicuous parcels

6912 Ovary leafy, Seeds naked
6913 Ovary naked, Seeds winged

6914 Leaves somewhat toothed ovate oblong

6915 Leaves quite entire
6916 Leaves ovate acuminate toothletted, Axils of veins hairy, Stigmas 4 linear
6917 Leaves hairy oblong-ovate acute sharply and angularly toothed

6918 Leaves ovate mucronate obsoletely 3-nerved, Cal. smooth with colored membranous teeth
6919 Leaves lin.-lanc. obtuse nerveless, Cal. smooth with membranous naked teeth
6920 Leaves lanc. lin. acute 3-nerved, Cal. silky villous, with membr. colored naked teeth
6921 Leaves oblong or oval mucr. pubescent on each side obsoletely 3-nerved, Branches villous, Cal. very vill.
6922 Leaves lanc. oblong hairy oblique reflexed at end
6923 Leaves oval lanceolate, Young shoots colored, Flowers large, Teeth of calyx colored
6924 Leaves obovate nerveless, Branches and calyxes hairy with membranous colored teeth
6925 Leaves ovate lanceolate short three nerved, Fl. sol. sessile, Cal. entire persistent
6926 Leaves subulate pungent, Branches hairy, Calyxes and teeth villous
6927 Branches flexuose, Flowers sessile fascicled, Cal. hairy
6928 Leaves lin.-lanc. pungent, Branches silky, Cal. smooth with membranous colored naked teeth
6929 Leaves lin.-lanc. pungent, Branches hairy, Cal. smooth with membranous col. pubescent teeth
6930 Leaves oblanc. densely dotted, Fl. sol. terminal, Sepals deciduous
6931 Leaves acicular rigid fascicled, Flowers solitary, Teeth of calyx colored
6932 Leaves linear recurved at end, Cal. smoothish, Teeth leafy lanc. naked, Stamens longer than cor.

6933 Leaves lanceolate obovate opp. Teeth of calyx round
6934 Leaves obovate altern. glaucous, Teeth of calyx triangular

and Miscellaneous Particulars.

require very little water. The best way to flower them is to expose them to the air all the summer, which makes them get plump and throws them into flower-bud. Most of the species are fine flowers. Cuttings, after they are taken off, should be left to dry a few weeks till they are shrivelled, then potted, and they will root immediately. (*Bot. Cult.* 31.)

1112. *Rhipsalis.* From ῥιψ, a willow branch, in allusion to the flexible decumbent branches of the genus. Curious, branched, jointed, leafless, prostrate plants. Culture as in Cactus.

1113. *Bartonia.* Named by Pursh, in honor of Dr. B. S. Barton of Philadelphia, an American botanist. Beautiful plants, with alternate pinnatifid rough glaucous leaves, and large white flowers, which open during the night, and spread a most agreeable odor. Very rare, if they yet exist, in collections.

1114. *Philadelphus.* A name used by Athenæus for a tree which is now unknown. Bauhin applied it to this genus. The species are free flowerers, well adapted for the shrubbery. The native country of P. coronarius is not known; it is generally referred to the south of Europe, but it has only been found twice in Italy, and then in situations where it might have been planted. The flowers have the appearance and odor of those of the orange, but the odor in near contact is much more powerful. Seeds are seldom produced in this country. The leaves taste like fresh cucumbers. P. grandiflorus is a very shewy plant. All the species grow freely in common soil, and are increased by layers.

1115. *Leptospermum.* From λεπτος, slender, and σπερμη, seed, in allusion the extreme tenuity of the seeds. Pretty New Holland plants. L. scoparium grows commonly in dry places near the shores in New Zealand, and the underwood in Adventure Bay, Van Dieman's Land, chiefly consists of this shrub. The leaves were used by Captain Cook's ships' crews as tea, whence they named it the tea plant. The leaves have a very agreeable bitter flavor, with a pleasant smell, when fresh; but lose something of both, when dry. If the infusion was made strong, it proved emetic to some, in the same manner as green tea. It was also used with spruce leaves, in equal quantity, to correct their astringency in brewing beer from them; and they rendered the beer exceedingly palatable.

Young cuttings of all the species will root readily in sand, under a bell-glass: the species may also be raised from seeds; but plants from cuttings are best, as they flower young, and the seedlings do not flower till they attain a considerable size. (*Bot. Cult.* 214.)

1116. *Fabricia.* Dedicated by Gærtner to John Christian Fabricius, the famous Entomologist. The species

History, Use, Propagation, Culture,

requiring to grow to a good size before they produce flowers are well adapted for a conservatory: the culture and propagation as in Leptospermum.

1117. *Metrosideros.* From μητρα, the heart of a tree, and σιδηρον, iron, in allusion to the hardness of the wood. One species (M. vera) is called iron wood. The Chinese make their rudders and anchors of it; and among the Japanese it is so scarce and valuable that it is only allowed to be manufactured in the service of their king. The bark is used as a remedy for fluor albus and diarrhœa, being mixed with Pinang, and a small quantity of cloves and nutmegs. This is a genus distinguished at sight by the peculiar character of the shrubs of Australasia, with both sides of the leaf alike. M. hispida, lanceolata, and speciosa, are beautiful plants, but not free flowerers. They are rather difficult to strike. Sweet recommends "ripened wood planted under a bell-glass in sand."

1118. *Psidium.* One of the Greek names of the Pomegranate. In English it is called *Guava*, a corruption of the American name *Guayaba*. Most of the species are cultivated in the tropics for their fruit, which also ripens freely in this country, though it is of little merit. P. pyriferum bears fruit the size of a hen's egg, yellowish, with a peculiar smell. The rind is brittle and fleshy; pulp rather firm, full of bony seeds, flesh colored, sweet, aromatic, and pleasant. In the West Indies it is eaten with avidity, not only by the natives, but by Europeans: with those who are not accustomed to it, the Guava is apt to occasion a slight flux; but Jacquin affirms, that when he has been thirsty on a journey he has eaten of it to satiety without suffering any harm. It is eaten raw in the dessert, but the seeds are scarcely separable. It is also preserved with sugar. P. pomiferum has fruit like a pomegranate, which is seldom eaten, though eatable, and being astringent is counted strengthening for the stomach. P. Cattleianum is reckoned one of the best of the Guavas; the fruit is of a fine deep claret color, and the pulp in consistence and flavor bears a considerable resemblance to the strawberry.

All the species are of easy culture in light and rather rich loam, and are increased readily by seeds, layers, or cuttings in sand under a hand-glass.

6935 Leaves opposite cordate at base stem-clasping, Branches calyxes and peduncles hispid
6936 Leaves opposite stalked ovate lanceolate, Panicle brachiate, Pedic. umbelled
6937 Leaves opposite stalked lin.-lanc. acuminate oblique, Panicle brachiate decompound
6938 Leaves opposite ovate netted veiny beneath pubescent, Heads lateral stalked and bractes downy
6939 Leaves opposite lin.-lanc. naked, Pedunc. axillary umbelled, Bractes lanc. smooth
6940 Leaves alternate lanceolate 3-nerved, Fl. racemose clustered terminal smooth
6941 Leaves scattered linear channelled acute rigid, Fl. lateral clustered sessile
6942 Leaves alternate lin. filiform rigid mucronate channelled rough, Fl. clustered sessile
6943 Leaves alternate linear-lanceolate, Fl. clustered lateral pubescent
6944 Leaves alternate lanceolate narrowed at each end mucronate, Fl. lateral clustered sessile smooth
6945 Leaves alternate lanceolate mucronate, Fl. lateral clustered sessile pubescent
6946 Leaves scattered lanceolate veiny glandular mucronate, Caps. downy at end
6947 Leaves ovate-lanceolate acuminate quite smooth, Cymes stalked many-flowered
6948 Very like M. lanceolata, but the blossoms appear more copiously
6949 Leaves alternate lin.-lanceolate with a long acute point
6950 Leaves lin.-lanceolate with a long point dotted rough

6951 Leaves elliptical pubescent beneath, Peduncles 1-flowered
6952 Leaves oblong lanceolate pubescent beneath, Peduncles 3-flowered
6953 Leaves oblong acuminate smooth, Peduncles 1-flowered
6954 Leaves sessile cordate rounded smooth on each side, Pedunc. 1-fl. clustered
6955 Leaves oblong acuminate crenulate shining, Peduncles many-fl.
6956 Leaves ovate oblong acute sub-crenate, pubescent above rugose beneath, Branches reclinate
6957 Leaves obovate smooth coriaceous, Fruit purple

6958 Leaves entire oblong, Peduncles 4-fl. lateral
6959 Leaves entire lanceolate, Pedunc. 4-fl. terminal
6960 Leaves entire ovate-lanceolate, Ped. many-fl. axillary shorter than petiole
6961 Leaves elliptical, Pedunc. trichotomous lateral and terminal, Stamens much longer than petals

6962 Leaves entire oblong acuminate obtuse flat, Pedunc. axill. many-fl. the length of petioles
6963 Leaves entire roundish ovate obtuse, Pedunc. axill. many-fl. trichotomous the length of leaves
6964 Leaves entire oblong-lanceolate acuminate, Pedunc. axillary many-fl. racemose shorter than leaf
6965 Leaves entire elliptical acuminate, Pedunc. panic. axill. and terminal, Fruit globose
6966 Leaves entire lanceolate narrowed at base obtuse veinless, Pedunc. 1-fl. solitary terminal
6967 Leaves entire ovate-lanceolate, Pedunc. 1-flowered solitary lateral
6968 Leaves entire oblong acuminate coriaceous not dotted, Pedunc. 1-fl. filiform
6969 Leaves entire ovate oblong acuminate netted with veins, Pedunc. 1-fl. about 3 in fruit nodding

6970 The only species

6971 Flowers solitary, Involucre 2-leaved
α Leaves ovate longer than the peduncles
β Leaves ovate with round berries

and Miscellaneous Particulars.

1119. *Eugenia.* In honor of Prince Eugene of Savoy, who was a protector and encourager of botany, and possessed a botanic garden. Some of the species bear edible fruits: that of E. malaccensis is ovate, an inch and a half in diameter, flesh smelling like the rose, agreeable to the taste, and wholesome. It is generally cultivated between the tropics. E. Jambos bears smaller fruit, edible, but not so much esteemed; it is nevertheless excellent, resembling in appearance and flavor a Brussels apricot, and produced in great abundance in the stove. All the species grow freely in two-thirds loam and one-third peat, and flower abundantly when the plants are of a good size. Ripened cuttings strike root freely in sand under a hand-glass.

1120. *Caryophyllus.* The Arabs, who have been acquainted from all antiquity with the clove, called it *qarunfel*, which the Greeks altered into *Caryophyllon*. *Giroflier*, Fr. The fruit is thought to bear some resemblance to a nail, and hence is called clove, *clou*, Fr., *Chiode*, Ital., *Clavo*, Span., *Naghel*, Ger. and Dutch. The whole tree is aromatic, and the fruit or clove is considered as one of the hottest and most acrid substances of the aromatic class, and as such is often used, not only internally, but externally, as a stimulant; as in paralytic cases for example, in which the oil of cloves has been administered to advantage: it is also made use of in the tooth ache, in which it often succeeds in suddenly abating and subduing the pain. A tincture of cloves in rectified spirit is kept in the shops, as well as the essential oil, which latter is perhaps seldom free from sophistication. For culinary purposes, the uses of cloves are innumerable. The Dutch, who had for a long time the monopoly of the spice trade, prevented while they could the tree from being removed from the Moluccas and other islands, where it grows naturally; but the French now cultivate it in Cayenne and St. Domingo. There are a few specimens in the British gardens. It grows freely in loam and peat, and ripened cuttings are not difficult to root in sand, in moist heat under a hand-glass.

1121. *Myrtus.* From μύρον, perfume. Μυρτος of the Greeks. *Le Mirte*, Fr., *Myrte*, Ger., *Myrtus*, Dutch, *Mirto*, Ital. and Span., *Myrta*, Portug., *Myrter*, Dan. and *Myrten*, Swed. The common myrtle is a well known popular shrub, which has been in English gardens for an unknown length of time; evidently from

History, Use, Propagation, Culture,

what Gerarde and Evelyn say, before the invention of greenhouses, and probably in that case preserved by covering or housing in rooms. It was a great favorite among the ancients, for its elegance, and its evergreen sweet leaves. It was sacred to Venus, either on this account, or perhaps because it flourishes most in the neighbourhood of the sea. Myrtle-wreaths adorned the brows of bloodless victors, and were the symbol of authority for magistrates at Athens. Both branches and berries were put into wine, and the latter were used in the cookery of the ancients. The myrtle was also one of their medicinal plants. All parts of it are astringent, but it is discarded from modern practice.

M. coriacea, sometimes called wild cinnamon, is a most elegant tree, with a handsome ash-colored straight trunk, and pyramidal head. It grows slowly, and flowers late twice a year In old trees, the bark becomes white, and hangs down in shreds which have an aromatic quality. The timber is red, very hard, and used in mill-work The berries, which are the size of peas, and of an agreeable aromatic smell and taste, are used in culinary purposes.

1122. *Calyptranthes.* From καλυπτρον, a lid, and ανθος, a flower, in allusion to the peculiar manner in which the segments of the calyx, being grown together, fall off.

Zuzygium, is so called from συζυγος, coupled, in allusion to the manner in which the branches and leaves are united by pairs. C. Jambolana, frequently called the Java plum, bears a black esculent berry. Cuttings of this genus, Sweet observes, "do not strike freely; ripened ones strike best in sand under a bell-glass; but the plants root best from layers." (*Bot. Cult.* 34.)

1123. *Pimenta.* A genus readily distinguishable from Myrtus by the structure of its ovarium. It is a handsome tree, common in the hilly parts of the north side of Jamaica. The flowers are without shew, and are succeeded by spherical purple berries crowned with a persistent calyx: they are called Jamaica pepper or all-spice, from their taste being thought to resemble a composition of all other spices. The berries are gathered before being ripe, and are carefully dried on mats or terraced floors in the shade. In ten or twelve

χ Leaves ovate-lanceolate acute
δ Leaves ovate-lanceolate close together
ε Leaves lanceolate ovate acute
ξ Leaves lanceolate acuminate
η Leaves lin.-lanceolate acuminate. Very small

6992 Lid conical rounded coriaceous twice as long as calyx, Umb. lateral solitary
6993 Leaves ovate thickened at edge, Umbels lateral
6994 Leaves ovate-lanceolate, Heads lateral solitary, Fruit globose
6995 Leaves lin.-lanceolate, Heads lateral solitary, Fruit turbinate
6996 Lid hemispherical obtuse, Heads lateral solitary, Fruit turbinate
6997 Heads lateral solitary, Pedunc. cuneate compressed, Fruit turbinate
6998 Umb. lateral and terminal, Pedunc. compressed, Branches angular
6999 Pedunc. compressed, Branches angular, Umbels lateral panicled or solitary
7000 Pedunc. and branches round, Umb. lateral solitary
7001 Umb. corymbose panicled terminal, Calyx round, Lid hemispherical mucronulate

and Miscellaneous Particulars.

days they become wrinkled, dry, and of a dark brown color, and are then packed in bags or casks for sale. Some kiln-dry them by which the same object is sooner effected. The berries have an agreeable aromatic subastringent taste, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm pungent taste of the cloves; qualities which reside chiefly in the cortical part of the dried berry, and are better extracted by a watery infusion, than by spirit or distillation. They are much used in the kitchen, and also by the druggists to cover the disagreeable taste of other remedies, or to give them warmth. An oil is obtained by distillation which is said to be nearly equal to that of oil of cloves, and sometimes substituted for it.

1124. *Olynthia.* So named from ὀλυνθος, a little fig or berry. A genus separated from Myrtus on account of the singular manner in which all the parts of the seed are consolidated. A small stove plant common in collections.

1125. *Stravadium.* The Malabar name of this plant is *Tsjera samstravadi*, from which Stravadium has been contrived. A fine tree with racemose flowers, and large, four-cornered, oblong fruit. A delicate stove plant rarely seen.

1126. *Eucalyptus.* From ευ, well, and καλυπτω, to cover as with a lid; a name, therefore, with the same meaning as Calyptranthes, No. 1122. This genus consists of the loftiest timber trees of New Holland. Botanists knowing them principally from dried specimens, their respective heights cannot be stated correctly. They are all of the tallest habit, and soon grow beyond the limits of our stoves. In Van Dieman's Island a manufactory has been established for the preparation of extract of tannin from the bark of various species of Eucalyptus. A considerable quantity of the substance has been imported into England recently, and it is said to have been found by the tanners to be twice as powerful in its operation as oak-bark.

E. resinifera produces a gum resin something like the Kino of druggists (obtained from a species of Pterocarpus), and for all medical purposes full as efficacious.

All the species, Sweet observes, "are fine plants for a large conservatory, as they grow very fast, and are

History, Use, Propagation, Culture,

generally well clothed with beautiful foliage; they will also flower freely, when of a moderate size. The best soil for them is a mixture of loam and peat; and cuttings of them may be struck in sand under a bell-glass; but they are not so free to root, as most of this natural order are. (*Bot. Cult.* 189.)

1127. *Punica.* This fruit was called by the ancients *Malum Punicum*, Carthaginian apple; because, as Pliny tells us, the tree was first known to grow in the vicinity of Carthage. Hence has the term Punica been constructed. P. nana has very small fruit and flowers, and is used in the West Indies as a hedge-plant, as P. Granatum (from *granum*, grain, on account of the numerous grains of its fruit) is in the south of France and in Italy. The latter, in its wild state, is a thorny bush not unlike our hawthorn: the flowers have a fine appearance, and the fruit is very ornamental. It will produce fruit, trained against a south wall, in many parts of England; and under a glass-case, or against a flued wall, it is probable, the fruit might be as highly flavored as that imported from Genoa and Leghorn. The flowers come out at the ends of the branches, singly, or three and four together; and, therefore, in pruning, care must be had to bring into action only the strongest buds. For this purpose, all the weak shoots should be cut out, and the stronger ones shortened, so as to produce bearing-shoots over the whole tree. The best soil is a rich strong loam.

The double-flowering varieties are to be treated in the same manner, and are highly ornamental.

1128. *Amygdalus.* The Greek name of the almond. The species are fruit-trees, or ornamental trees and shrubs, both much esteemed for the gay color and early appearance of their flowers. A. Persica, the peach and nectarine, bears the most exquisitely delicious of European fruits; it is more gratifying to the palate by its mass of juicy pulp than the grape, and more delicate than the melon. Some, however, prefer the grape and melon to the peach and nectarine; but the most delicate of taste consider the latter as surpassed only by the pine-apple. The varieties of peach and nectarine are numerous, and by raising from seed might easily be rendered innumerable. The best varieties have been raised in France, at Montreuil, a village of peach growers for the Paris market. Some good varieties have been raised in England by Mr. Knight, and other members of the Horticultural Society. The peach, to attain its proper flavor, must be protected by glass during the spring and earlier summer months, and exposed to the direct influence of the weather during the ripening process. Ripened under glass, unless very liberal supplies of air are given, the flavor will be very inferior. Mr. Knight considers that the direct rays of the sun (without the intervention of glass) are of great advantage to the proper ripening, and essential to the coloring of the peach.

Linnæus divides the A. Persica into two varieties; that with downy fruit, or the peach, and that with smooth fruit, or the nectarine. There are various instances on record (*Hort. Trans.* vol. i. p. 103.) of both fruits growing on the same tree, even on the same branch; and one case has occurred of a single fruit partaking of the nature of both. The French consider them as one fruit, arranging them in four divisions; the *pêches*, or free-stone peaches, the flesh of whose fruit separates readily from the skin and the stone; the *pêches lisses*, or free-stone nectarines, or free-stone smooth peaches; the *pavies*, or cling-stone peaches, whose flesh is firm, and adheres

7002 Lid hemispherical obtuse, Cal. angular, Umb. panicled terminal

7010 Leaves amplexicaul. with a short point glaucous beneath
7011 Leaves lanc. attenuated with a filiform point netted with veins beneath
7012 Leaves acute reticulated, the nerves united at the margin
7013 Leaves falcate at end, those on the branchlets small clustered
7014 Leaves linear narrowed at base obtuse veiny with nerves united on this side the edge
7015 Leaves 6 lines long and 1½ broad with the lateral parallel nerves united on this side the edge
7016 Leaves stalked cordate obtuse with nerves downy beneath, Branches and peduncles strigose
7017 Leaves amplexicaul. lanceolate with a long point glaucous beneath

7018 Leaves linear, Stem shrubby
7019 Leaves lanceolate, Stem arborescent

7020 Leaves with all the serratures acute, Flowers sessile solitary

7021 Lower serratures of the leaves glandular, Flowers sessile in pairs

7022 Leaves ovate attenuate at base simply and finely serrate
7023 Leaves oblong lanceolate serrate downy beneath
7024 Leaves lanceolate entire silvery perennial shorter than footstalk
7025 Leaves lanceolate doubly serrated

and Miscellaneous Particulars.

both to the skin and stone; and the *brugnons*, or nectarines, or cling-stone smooth peaches. *Knight.* (*Hort. Trans.* iii. 1.)

The double-blossomed peach is one of the most ornamental of spring-flowering trees; its blossoms appear about three weeks later than those of the common peach.

A. communis and amara, and especially the former, are employed as ornamental trees in front of shrubberies, and in suburban gardens. In the south of France, Italy, Spain, and different parts of the Levant, they are cultivated for their fruit. In France they have above a dozen species or varieties, besides a hybrid called the almond-peach. (See *Duhamel.*) The common and bitter almond are only to be distinguished by the taste of the kernels of their fruit. The Jordan almonds, which come from Malaga, are the best sweet almonds brought to England; the bitter come chiefly from Magadore. The bitter cuticle of almonds is taken off by immersion in boiling water. The almond eaten as food is not very digestible, and requires to be well masticated.

Robertson (*Hort. Trans.* iii. 382.) and various botanists consider the peach and almond as one species.

Four distinguished and ingenious attempts have been made to class the varieties of peaches and nectarines by the leaf and flower as well as the fruit: the first is by Poiteau, in the Bon Jardinier; the next by Count Lelieur, in his Pomone Française; the third by Robertson, nurseryman, of Kilkenny, whose arrangement is founded on the glands of the leaves; and the fourth, and most important, by Mr. George Lindley, in the fifth volume of the Horticultural Society's Transactions. The latter writer has, in a peculiarly distinct manner, arranged no fewer than 155 sorts of peaches and nectarines in well defined divisions or sections.

The bitter almond contains less fixed oil, than the sweet almond, and a portion of prussic acid or hydrocyanic acid, upon which its narcotic power is supposed to depend. This variety is said to operate as a poison on dogs and some other animals, but not generally on the human species. The distilled water exerts an action not less deleterious than that of laurel water on the human frame. It produces vertigo, head-ache, tinnitis aurium, dizziness of sight, and vomiting, when taken to the extent of thirty drops only; and a drachm of it has killed a stout dog. When a large doze is taken, death almost instantly follows. In order to counteract its poisonous effects recourse is had to diffusibles, as brandy and ammonia; or three or four spoonfuls of oil of turpentine may be given at intervals of half an hour. The fixed oil, which both varieties of the almond yield by expression in large quantity, is insipid and inodorous when heat has not been employed.

Sweet almonds are used more as food than as medicine, but they afford little nourishment. Heartburn is said to be relieved by eating six or eight of them decorticated. When triturated with water, milky mixtures or emulsions are formed; and they are also used in pharmacy for assisting, by trituration, the combination of substances, such as camphor and the resins with water. Bitter almonds are scarcely ever used medicinally. (*London Dispensatory*, 151.)

A. nana and pumila are very ornamental shrubs, both in their double and single varieties.

History, Use, Propagation, Culture,

1129. *Prunus.* The origin of this name is wholly unknown. The Greeks called it προυνη, and the Latins *prunus.* From this genus have been obtained the principal characters of that section of the natural order Rosaceæ, which is called Amygdaleæ or Prunaceæ, and which is curiously and chemically known by the presence of Prussic acid all in the species, and in all their parts.

P. Padus (a name of Theophrastus), the bird-cherry, is an ornamental tree, by its purple bark, leafy bunches of white flowers, and berries successively green, red, and black. It is common in the native woods of Scotland and Sweden, and in both countries the berries are infused in spirits in order to give them an agreeable flavor. The fruit is nauseous to the taste, though greedily eaten by birds. The bark is used by the Finlanders to cure venereal complaints, and also with success by regular practitioners in Stockholm for the same purpose. (*Stockholm Acts.*) The tree is very leafy, and dislikes a wet soil; but bears lopping as copsewood. The wood is beautifully veined, and used for cabinet work in France, as is that of P. virginiana in America.

P. rubra greatly resembles P. Padus. P. caroliniana is an imperfect evergreen.

P. Lauro-cerasus is one of our most popular evergreens. It was first brought from Constantinople to Holland in 1576; the first we read of in England was one at Highgate, in the garden of Mr. James Cole, a merchant of London, who, as Parkinson informs us, used to cover it in winter with a blanket. In less than half a century afterwards (1688), Ray informs us, the laurel was common in English gardens. It is now as universal in shrubberies as the rose. The kernel-like flavor of the fresh leaves has led to their use in flavoring custards and other culinary preparations; but as these leaves are poisonous, they ought to be used with caution. To brute animals the effect of the distilled water of laurel leaves is almost instant death; and two women in Dublin, and Sir T. Boughton in England, have been poisoned by it.

P. lusitanica is a most beautiful evergreen shrub, nearly as universal as the lauro-cerasus. It was brought to England from Portugal, but does not appear to be a native of that country; probably of Madeira or some other islands possessed by the Portuguese in the sixteenth or seventeenth centuries.

P. Mahaleb (*Mahhaleb* the Arabic name) flowers profusely, and disperses an odor resembling that of Clematis for a considerable distance around. Its fruit is round, shining black, and so hard that it has been bored for beads by the catholics. The wood is perfumed and used by the French in cabinet-work, especially in the village of St. Lucie, near Commercy, whence, among the French, the plant has obtained the name of *Bois de St. Lucie.*

P. Cerasus, the cultivated cherry, is by some considered a distinct species, and by others only a variety of P. avium, the gean or wild black cherry. Lucullus is said to have first introduced the cultivated cherry to Italy, in 73 A. C. from a town in Pontus in Asia, called Cerasus, whence its specific name, and it was introduced to Britain 120 years afterwards. Many suppose that the cherries introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII. by Richard Haines, the fruiterer to that monarch. But though we have no proof that cherries were in England at the time of the Norman conquest, or for some centuries after it; yet Warton has proved, by a quotation from Lidgate, a poet who wrote about

7026 Flowers racemose, Racemes pendulous, Lvs. decid. doubly serrat. somewhat rugose, Petioles with 2 glands
β Serratures of leaves less, Racemes more erect
7027 Flowers racemose, Racemes erect, Leaves deciduous doubly toothed smooth, Stalks with 4 glands

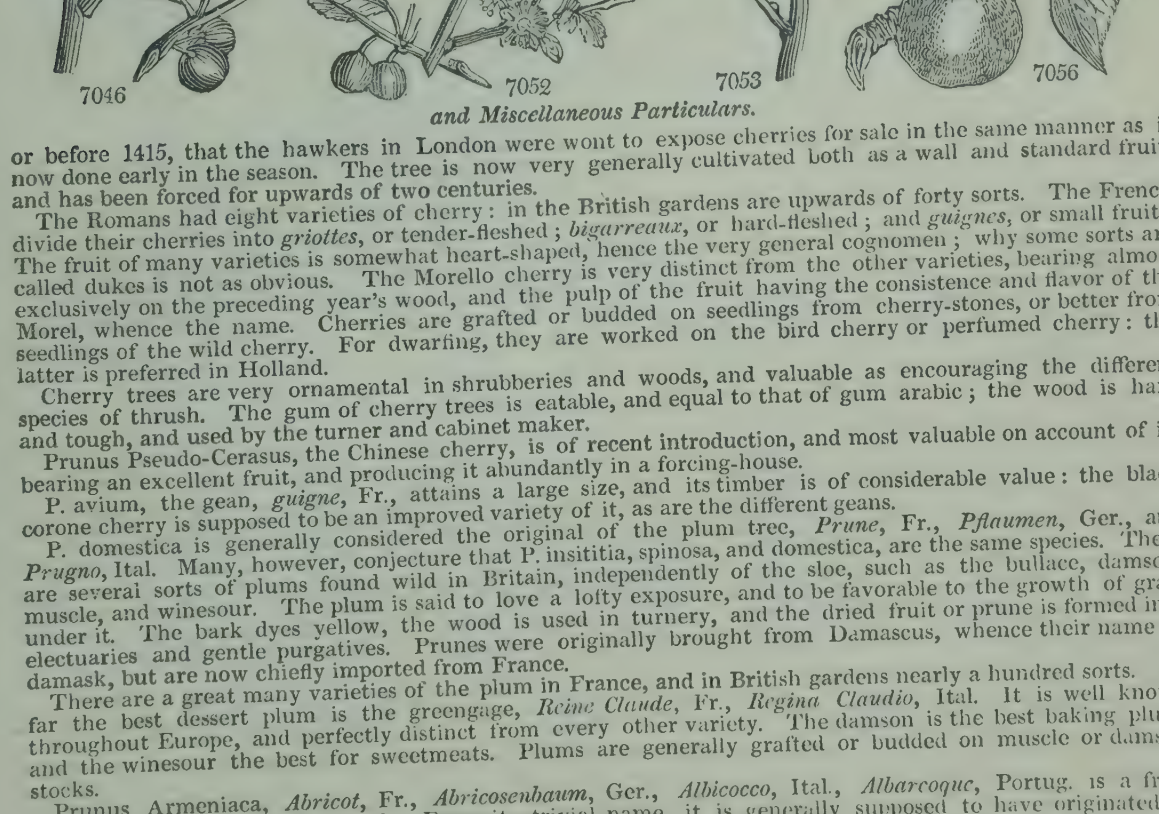
7052 Peduncles solitary, Leaves ellipt. lanceolate pubescent beneath, Branches spiny
7053 Peduncles twin, Leaves ovate cut serrate without glands beneath white, Stem prostrate
7054 Flowers corymbose, Ped. elongated, Leaves oval oblong eroded membranous smooth
7055 Umbels sessile aggregate few-fl. Leaves ovate ellipt. acute smooth on each side with 2 glands at base
7056 Flowers sessile, Leaves subcordate



and Miscellaneous Particulars.

or before 1415, that the hawkers in London were wont to expose cherries for sale in the same manner as is now done early in the season. The tree is now very generally cultivated both as a wall and standard fruit, and has been forced for upwards of two centuries.

The Romans had eight varieties of cherry: in the British gardens are upwards of forty sorts. The French divide their cherries into *griottes*, or tender-fleshed; *bigarreaux*, or hard-fleshed; and *guignes*, or small fruits. The fruit of many varieties is somewhat heart-shaped, hence the very general cognomen; why some sorts are called dukes is not as obvious. The Morello cherry is very distinct from the other varieties, bearing almost exclusively on the preceding year's wood, and the pulp of the fruit having the consistence and flavor of the Morel, whence the name. Cherries are grafted or budded on seedlings from cherry-stones, or better from seedlings of the wild cherry. For dwarfing, they are worked on the bird cherry or perfumed cherry: the latter is preferred in Holland.

Cherry trees are very ornamental in shrubberies and woods, and valuable as encouraging the different species of thrush. The gum of cherry trees is eatable, and equal to that of gum arabic; the wood is hard and tough, and used by the turner and cabinet maker.

Prunus Pseudo-Cerasus, the Chinese cherry, is of recent introduction, and most valuable on account of its bearing an excellent fruit, and producing it abundantly in a forcing-house.

P. avium, the gean, *guigne*, Fr., attains a large size, and its timber is of considerable value: the black corone cherry is supposed to be an improved variety of it, as are the different geans.

P. domestica is generally considered the original of the plum tree, *Prune*, Fr., *Pflaumen*, Ger., and *Prugno*, Ital. Many, however, conjecture that P. insititia, spinosa, and domestica, are the same species. There are several sorts of plums found wild in Britain, independently of the sloe, such as the bullace, damson, muscle, and winesour. The plum is said to love a lofty exposure, and to be favorable to the growth of grass under it. The bark dyes yellow, the wood is used in turnery, and the dried fruit or prune is formed into electuaries and gentle purgatives. Prunes were originally brought from Damascus, whence their name of damask, but are now chiefly imported from France.

There are a great many varieties of the plum in France, and in British gardens nearly a hundred sorts. By far the best dessert plum is the greengage, *Reine Claude*, Fr., *Regina Claudio*, Ital. It is well known throughout Europe, and perfectly distinct from every other variety. The damson is the best baking plum, and the winesour the best for sweetmeats. Plums are generally grafted or budded on muscle or damson stocks.

Prunus Armeniaca, *Abricot*, Fr., *Abricosenbaum*, Ger., *Albicocco*, Ital., *Albarcoque*, Portug. is a fruit tree next in esteem to the peach. From its trivial name, it is generally supposed to have originated in Armenia, but Regnier and Sickler assign it a parallel between the Niger and the Atlas; and Pallas states it to be a native of the whole of the Caucasus; the mountains there, to the top, being covered with it. Thunberg describes it as a very large, spreading, branchy tree in Japan. Grossier says, that it covers the barren mountains to the west of Pekin, that the Chinese have a great many varieties of the tree double-

History, Use, Propagation, Culture,

blossomed, which they plant on little mounts for ornament, and dwarfs in pots for their apartments. It appears from Turner's Herbal, that the apricot was cultivated here in 1562; and in Hackluyt's Remembrancer, 1582, it is affirmed, that the apricot was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII. The fruit seems to have been known in Italy in the time of Dioscorides, under the name of *Præcocia*, probably, as Regnier supposes, from the Arabic, *Berkoch*; whence the Tuscan, *Bacoche* or *Albicocco*, and the English *Apricock*; or, as Professor Martyn observes, a tree when first introduced, might have been called a *præcox*, or early fruit; and gardeners, taking the article *a* for the first syllable of the word, might easily have corrupted it to apricocks. The orthography seems to have been finally changed to apricot about the end of the last century.

There are fifteen or twenty excellent varieties of apricot, besides the peach apricot, a large fruit supposed to be a hybrid between a peach and an apricot. The trees are generally budded on plum stocks, and always trained against walls. Apricots do not force freely.

1130. *Chrysobalanus.* From χρυσος, gold, and βαλανος, an acorn; in allusion to the size, color, and form of its fruit. C. Icaco (the West Indian name) bears flowers and fruit not unlike the plum, which is sold in the markets of the West Indies, and eaten both raw and preserved. Both species grow well in a sandy loam. Large cuttings root best, taken off at a joint, and planted thinly in a pot of sand, without having their leaves injured, and a hand-glass placed over them. (*Bot. Cult.* 39.)

1131. *Mespilus.* In Greek μεσπιλη, from μεσος, half, and πιλος, bullet; the fruit resembling half a bullet or round ball. In French it is called *nefle*, from the Celtic *naff*, which also signifies truncate. M. Germanica, bears a turbinated berry, which is eaten raw in a state of incipient decay. It is little cultivated, but one or two trees are generally introduced in shrubberies or in complete orchards. There are one or two varieties besides the wild sort; what is called the Dutch medlar is reckoned the best. It is grafted on seedlings of the

7076 Leaves obtuse 3-lobed serrated smooth, Pedunc. and calyx covered with wool
7077 Spiny, Leaves 5-cleft cut wedge-shaped, Lower lobes divaricating, Stipules half cordate
7078 Leaves obtuse subtrifid toothed pubescent, Sepals ovate
7079 Leaves pinnatifid hairy on both sides, Segments serrate, Flowers with bractes
7080 Leaves pinnatifid downy on both sides, Segments trifid
7081 Leaves ovate trifid serrated: at the axillæ of the veins beneath hairy, Pedunc. and cal. pubesc. Styles 5
7082 Leaves cordate ovate cut-lobed serrated, Lower lobes divaricating, Flowers corymbose
7083 Leaves lobed sinuate serrated: at the base truncate cuneate beneath villous, Calyxes villous, Styles 5

7084 Unarmed, Lvs. obovate obl. acute crenate toothed downy beneath, Rachis glandular above, Cal. downy
7085 Unarmed, Leaves obovate obl. acuminate serrated smooth beneath, Rachis glandular above, Cal. smooth

and Miscellaneous Particulars.

wild medlar, or on any other species of the same genus: often on the common thorn. The other species bears fruit similar to M. germanica, but more dry.

1132. *Cratægus.* From κρατος, force, on account of the extreme hardness of the wood of the original Cratægus, which appears to be what is now called Pyrus aria, the beam-tree. This is a very ornamental genus of small hardy trees, valuable for the neatness of their foliage, the earliness of their flowers in spring, and the rich colors of their berries in autumn.

C. oxyacantha, οξυς, ακανθα, sharp-spine, is the best hedge plant in Europe, and also furnishes some highly ornamental varieties, especially the double-blossomed and scarlet-blossomed.

The fruit of C. odoratissima is very agreeable. That of the Azarole (*âl z'arour* Arabic, according to Castel and John de Souza) is much esteemed in the South of Europe. In this country it rarely arrives at perfection.

1133. *Pyrus.* From the Celtic *peren*, the Anglo-Saxons made *pere*, the English, *pear*, the French, *poire*, and the Latins, *pyrus*, or for the fruit, *pyrum.* From the Celtic word *api*, which also signified a fruit resembling an apple, the Greeks obtained απιος, the English, *apple*, the Germans, *apfel.* To this day the French distinguish a tribe of small fruited apples by the name *api.*

P. malus, *Pomme*, Fr., *Apfel*, Ger., and *Pomo*, Ital., is the most popular of British fruits. None can be brought to so high a degree of perfection with so little trouble; and of no other are there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our islands afford. Very good apples are grown in the Highlands and Orkneys, and even in the Shetland isles, (*Caled. Hort. Mem.* vol. ii.) as well as in Devonshire and Cornwall; some sorts are ripe in the beginning of July, and others, which ripen later, will keep till June. Unlike other fruits, those which ripen latest are the best.

The tree attains a great age, is in general very prolific, and the timber is valuable for the turner, millwright

History, Use, Propagation, Culture.

and cabinet maker. The Romans had twenty-two varieties, and there are now several hundreds in Britain and France, and some excellent sorts from America. They are usually divided into dessert, baking, and cyder fruits; the first high flavored, the second such as fall or become mellow in baking or boiling, and the third austere, and generally fruits of small size. Besides this division, apples are classed as pippins or seedlings, pearmains or somewhat pear-shaped fruits, rennets or queens, specked fruits, calvilles or white-skinned fruits, russets or brown fruits, codlings or falling fruits, and burknots, which grow readily by cuttings. Most sorts of apple form ugly trees as standards, but are otherwise very ornamental in shrubberies from their blossoms. The crabs, and especially the varieties obtained from the Siberian crab, form much the handsomest heads, and have also more brilliant blossoms. The apple may be propagated by layers, and many sorts by cuttings; but the usual mode is by grafting on crab-stocks, and for dwarfing on stocks of the paradise apple.

P. communis, *Poirier*, Fr., *Birnbaum*, Ger., and *Pero*, Ital., is a fruit-tree next in popularity and value to the apple tree. It is a greatly superior dessert fruit, but not so valuable for culinary purposes and the press. There are fewer good sorts of pears, in proportion to the number of current varieties, than of apples; but a few, as the Jargonelles, Bergamots, Beurrées, Chaumontelles, &c. are most exquisite dessert fruits, and are much easier of digestion than the apple. It arrives in greater perfection in France and the north of Italy than in England. The Chaumontelles of Guernsey are in high repute, as are the St. Germain's and other sorts of Picardy, and the Beurrées of Milan. The Romans had thirty-six varieties, and there are many hundreds in the French and British nurseries, most of them good for little. Professor Van Mons, of Brussels, and M. Duquessie, of Mons, fruited about 8000 seedling pears, from which they obtained nearly 800 sorts worth cultivating. (*Neill's Hort. Tour.*) The varieties are divided into dessert and baking fruits; and also into melting or butter pears, *beurrées*, Fr., breaking pears, *crevers*, Fr., and perry, *poirée*, Fr., fruits. The tree is grafted on seedlings of the same species, and for dwarfing and precocity on the quince. It is a much handsomer upright growing tree than the apple, more durable, and its wood hard and valuable for the turner and millwright; but its blossoms being white, are less shewy than those of the apple.

P. domestica, and the other species of service are very ornamental trees; their leaves are mostly white

7086 Leaves ovate serrated, Pedunc. corymbose
7087 Leaves serrated downy beneath, Flowers corymbose
7088 Leaves lin. lanc. hoary white with down beneath, Fl. axillary solitary subsessile
7089 Leaves ovate stalked entire silky beneath, Flowers corymbose

7094 Leaves cordate cut-serrate angular smooth, Pedunc. corymbose
7095 Leaves lanc. oblong shining tooth-serrated narrowed at base entire, Pedunc. corymbose
7096 Leaves roundish ovate cut serrate hoary beneath, Flowers corymbose
7097 Leaves ovate lanceolate cut-lobed toothed beneath snow-white, Flowers corymbose
7098 Leaves pubescent beneath pinnated with the last pinna very large pinnatifid and simple
7099 Leaves half pinnated downy beneath

7100 Leaves pinnated villous beneath
7101 Leaves pinnated smooth on both sides
7102 Leaves pinnated, Leaflets acute almost equally serrated and common petiole smooth
7103 Lvs. pinnated, Leaflets acuminate unequally cut serrated and common petiole smooth, Serratures bristly
7104 Leaves oval acutely serrated smooth, Fl. in corymbose heads [mucronate
7105 Leaves ovate oblong entire somewhat downy, Peduncle simple downy corymbose
7106 Leaves oblong cuneate at base unequally and doubly serrated hoary beneath, Fl. corymbose
7107 Leaves oval serrated, Fl. solitary dicœcious, Pet. linear the length of calyx

7108 Leaves downy deciduous
7109 Leaves smooth shining evergreen

7110 Leaves smooth deciduous

7111 Leaves oblong acute serrulate, Pedicels longer than calyx

7112 Leaves oblong lanc. distantly toothed, Pedicels shorter than calyx
7113 Leaves lanceolate distantly serrated, Panicle hairy

7114 Raceme imbricated with persistent foliaceous bractes, Petals roundish
7115 Leaves ovate lanceolate acuminate at each end, Pet. lanc. Stamens upright shorter than calyx
7116 Leaves long lanceolate, Stamens spreading longer than the calyx
7117 Leaves linear lanceolate, Sepals subulate much longer than stamens, Panicle contracted

7118 Leaves lanceolate serrated

and Miscellaneous Particulars.

underneath, and they are generally profusely covered with blossoms and fruit. Of P. domestica there are two varieties, the pear and apple-shaped, cultivated in some parts of France and near Genoa for their fruits. Those like the medlar and quince are not eaten till in a state of incipient decay. There are but few of the true service in English gardens, but the P. hybrida and pinnatifida are common, and their fruit, which resembles that of the mountain ash, is sometimes made use of.

P. aucuparia and Americana are handsome trees for shrubberies, the former very popular in suburban gardens.

1134. *Cydonia.* So called from being native of the ancient town Cydon in the Island of Crete; or perhaps it may be a corruption of malus-*cotonea*, by which the Latins designate the fruit. C. vulgaris is a deformed low tree, sometimes cultivated for its fruit, which is a pome with a persisting calyx like the medlar. It is used as a marmalade for flavoring apple-tarts. It prefers moist loam, and is raised by layers. It is most in use, however, as a stock for the pear. C. japonica is a beautiful low bush, remarkable for the brilliancy of its blossoms, which vary from the richest scarlet to the most delicate blush color. It is hardy, and well adapted for single plants, upon grass, or for forming ornamental hedges in flower gardens.

1135. *Photinia.* So named, we believe, from φως φωτος, light, in allusion to the lucid surface of the leaves of the species. P. serrulata and arbutifolia are elegant shrubs, and nearly hardy. The latter succeeds perfectly against a south wall.

1136. *Raphiolepis.* From ραφις, a needle, and λεπις, a scale, in allusion to the numerous, subulate, persistent bracteæ, which are mixed among the racemes of flowers. Pretty Chinese small shrubs, formerly known under the collective name of Cratægus indica.

1137. *Eriobotrya.* From εριον, wool, and βοτρυς, a bunch of grapes, in allusion to the woolliness of its raceme. This genus is excellently characterized by the structure of its seed, of which the radicula is retracted within the cotyledons, not exserted as in all the other genera of Pomaceæ. E. Japonica produces an agreeable fruit about the size of a gooseberry, of a fine yellow color, and, according to Sir Joseph Banks, as good as the mango. To ripen it with flavor, it requires the temperature of the stove, and comes into use in March. It may be grafted on any species of the genus, or on the hawthorn.

History, Use, Propagation, Culture,

1138. *Amelanchier.* According to Clusius, *Amelancier* is the old Savoy name of the plant. It has been adopted by Mr. Lindley as the title of a small group of plants nearly related to Pyrus, but curiously distinguished by the 10-cells of the ovary.

1139. *Cotoneaster.* Named in allusion to the cottony nature of the fruit and young branches of the most common species. Small inconspicuous bushes, with solitary pink flowers almost hidden among the leaves.

1140. *Waldsteinia.* Named by Willdenow, in honor of Franz de Waldstein, a distinguished German botanist. Plants with the aspect of Potentilla or rather Geum.

1141. *Spiræa.* Σπειρα, signifies a cord. *Spireon* is Pliny's name for a plant the blossoms of which are used in garlands. That plant is thought to have been the Viburnum Lantana. This genus affords some orna-

7119 Leaves roundish elliptical acute pubescent beneath, Sepals smooth, Germen villous
7120 Leaves oblong elliptical cuspidate smooth, Sepals smooth, Germen pubescent
7121 Leaves roundish elliptical acute smooth, Petals obovate, Sepals and germen pubescent

7122 Leaves ovate rounded at base, Cal. and pedunc. naked
7123 Leaves elliptical obtuse at each end, Cal. and pedunc. woolly
7124 Leaves ovate acuminate a little hairy on each side, Cal. and pedunc. naked
7125 Leaves ovate attenuate at base, Cal. and pedunc. woolly

7126 Leaves radical stalked 5-lobed

7127 Leaves lanceolate entire sessile, Racemes compound

7128 Leaves oblong serrated smooth, Racemes decompound

7129 Leaves ovate elliptical acute at each end smooth coarsely serrated, Racemes spreading panicled
7130 Leaves lanceolate unequally serrate downy beneath, Flowers doubly racemose
7131 Leaves linear-lanceolate toothletted smooth, Corymbs lateral
7132 Leaves obovate entire, Umbels sessile
7133 Leaves obovate cut-toothed at end, Corymbs stalked
7134 Leaves ovate lanceolate doubly toothed, Corymbs stalked
7135 Leaves broad ovate cut-serrate smooth, Corymbs terminal compound leafy
7136 Leaves obovate acute toothed at end 3-nerved, Corymbs close stalked
7137 Leaves oblong lanceolate serrated at end and entire, Corymbs stalked
7138 Leaves roundish bluntly lobed toothed, Umbels stalked
7139 Leaves obovate obtuse 3-lobed, Umbels lateral sessile
7140 Leaves obovate obtuse at the end bluntly and unequally 3-nerved, Corymbs axillary sessile
7141 Leaves ovate 3-lobed serrated, Corymbs stalked
7142 Leaves pinnated, Leaflets even serrated, Flowers panicled

7143 Leaves ovate acute smooth serrated stalked glaucous beneath, Cymes pubescent
7144 Leaves oblong bluntly and irregularly serrated, Flowers in dense corymbs
7145 Leaves obovate obtuse forwards doubly serrated smooth, Corymbs terminal compound, Flowers capitate
7146 Leaves supra-decompound, Spikes panicled, Flowers dioecious
7147 Leaves pinnated, Leaflets even serrated, Flowers corymbose

7148 Leaves pinnated downy beneath, The end lobe larger and 3-lobed; the side ones undivided

7149 Leaves pinnated smooth, The end lobe 7-lobed; the lateral 3-lobed, Corymbs proliferous

7150 Stipules linear entire, Calyx tubular campanulate
7151 Stipules leafy ovate cut-toothed, Calyx campanulate

7152 Leaves spatulate oblong, Joints of stem tumid, Fl. stalked
7153 Flowers sessile, Leaves linear oblong flat
7154 Leaves linear lanc. revolute at edge, Fl. terminal sessile
7155 Leaves lin. spatulate, Joints of stem equal, Fl. stalked
7156 Leaves lanc. spatulate, Joints of stem creeping filiform, Fl. stalked

7157 Leaves cuneiform ovate, Flowers sessile
7158 Leaves roundish cuneiform pilose, Fl. sessile, Cal. hairy
7159 Leaves lanceolate, Flowers sessile apetalous
7160 Leaves lanceolate, Flowers panicled

and Miscellaneous Particulars.

mental shrubs, free flowerers, and of easy culture; as S. salicifolia, hypericifolia, tomentosa, &c. The herbaceous species, especially filipendula, ulmaria, and aruncus, are also very ornamental.

1142. *Gillenia.* A genus well divided by Monch from Spiræa, from which it differs in so many respects as to make it astonishing that the species should ever have been referred to that genus, even by the most unreasonable advocate of the exploded doctrines of synthetical botany. Pretty North American plants with lobed discolored leaves, and white flowers.

1143. *Sesuvium.* Meaning of the name unknown. Inelegant plants with the habit of purslane.

1144. *Aizoon.* From αει, always, and ζωον, alive, always alive, or evergreen. A name given by the Greeks to the Sempervivum. This is an uninteresting genus, only known among the curious.

History, Use, Propagation, Culture,

1145. *Tetragonia.* From τετρας, quaternary, and γωνια, an angle, in allusion to the four angles of the bony pericarpium. The species are succulent trailers of no beauty, but possibly all fit to be used, like Chenopodium, as a spinage. T. expansa has been so used by Captain Cook when visiting New Zealand, and lately introduced for the same purpose in British gardens; as a summer spinage, it is as valuable as the orache, or perhaps more so. Every gardener knows the plague that attends the frequent sowing of common spinage through the warm season of the year; without that trouble it is impossible to have it good, and with the utmost care it cannot always be obtained exactly as it ought to be, (particularly when the weather is hot and dry,) from the rapidity with which the young plants run to seed. The New Zealand spinage, if watered, grows freely, and produces leaves of the greatest succulency in the hottest weather. Anderson, one of its earliest cultivators, had only nine plants, from which, he says, "I have been enabled to send in a gathering for the kitchen every other day since the middle of June, so that I consider a bed with about twenty plants quite sufficient to give a daily supply, if required, for a large table."

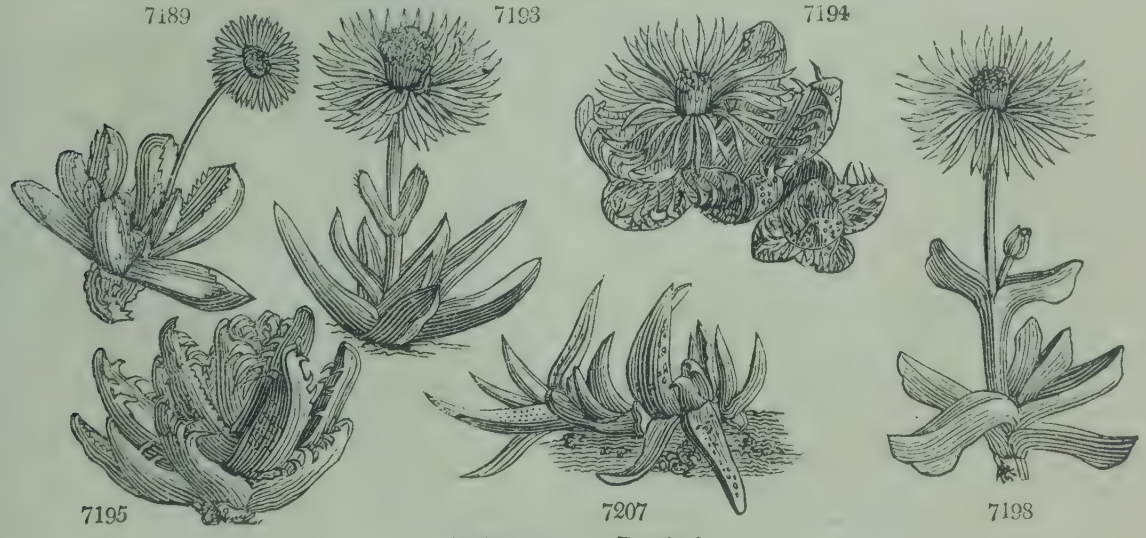
7161 Herbaceous, Leaves ovate rhomboid, Fruit with 4 horns
7162 Frosted, Leaves ovate sessile, Fruit not horned
7163 Shrubby, Leaves linear, Fruit winged
7164 Shrubby frosted, Leaves obovate, Fruit winged
7165 Procumbent, Leaves sessile lanceolate decumbent, Wings of fruit 8 alternately smaller
7166 Smooth herbaceous erect, Lower leaves ovate: upper lanceolate smooth, Fl. racemose
7167 Smooth herbaceous, Leaves ovate stalked, Fruit winged
7168 Herbaceous, Leaves rhomboid ovate, Fruit ubinate
7169 Leaves alternate linear revolute at edge with a dorsal line above
7170 Leaves alternate frosted obovate with winged decumbent stalks

§ 1. *Stem none or very short, Root perennial, Leaves large.*

7171 Whitish polished unarmed, Flower with a long tube
7172 Smooth rather glaucous with branched confluent spots, Ovary exserted
7173 Smooth green with great confluent branched spots, Ovary included
7174 Glaucous, Spots branched confluent, Ovary included
7175 Green, Spots confluent wart-like, Ovary included
7176 Pyriform glaucous retuse at end, Spots generally distinct green and obsolete
7177 Very depressed and rather glaucous, Spots nearly distinct, Ovary exserted
7178 Somewhat hoary and pubescent much depressed
7179 Nearly globose pale green berry-shaped with little dark scarcely confluent spots
7180 Glaucous smooth, Ends of the leaves unequally distinct flat above
7181 Leaves about 4 broadly ovate or parabolical half rounded expanded
7182 Leaves 6-8 oblong-ovate half round erect
7183 Green, Leaves unequally half rounded acinaciform obtuse
7184 Whitish, Leaves equally half rounded very blunt
7185 Stemless, Leaves rounded very smooth
7186 Leaves perfect about 4 clavate 3-cornered very thick glaucous with many large dots

7187 Leaves hoary at the base half rounded and thin upwards gibbous and keeled
7188 Stemless, Leaves entire half round green marbled at the end keeled 3-cornered
7189 Stemless, Lvs. glaucous towards the end and the bractes incurved and toothed, Pedunc. length of leaves
7190 Leaves glaucous, Marginal fringes numerous very deep
7191 Nearly steml. Lvs. glauc. towards end entire or with large teeth, Bractes entire, Pedun. longer than leaves
7192 Stemless smooth whitish, Lvs. half round entire at end keeled 3-cornered little thickened with a recurved
7193 Stemless very smooth white, Leaves thick subulate 3-cornered obtuse with a point [point
7194 Green stemless, Leaves cordate ovate expanded marbled with white and with a deep fringe
7195 Stemless glaucous, Leaves deeply tooth-fringed obsoletely dotted with a cartilaginous keel at end
7196 Stemless green with clear spots, Leaves 3-cornered towards the end with a shortly toothed fringe
7197 Nearly stemless glaucous, Leaves with 3 rows of toothed fringe and small dots
7198 Leaves exactly hatchet-shaped, The old stem nearly six inches high and erect
7199 Leaves keeled 3-cornered green, Scape strong panicled 2-edged
7200 Leaves erect incurved keeled upwards long glaucous rugose with large dots
7201 Leaves very glaucous triquetrous compressed at the end with a dilated keel which is often toothletted

7202 Leaves obt. dotted with gibbous pustules at the base in the inside, Stem strong short decumbent branch.
7203 Stemless, Leaves connate dotted half round at the end triquet. reflexed acute, Fl. sessile, Cal. cylin. 6-fid
7204 Nearly stemless, Leaves hoary glaucous obtuse towards the end with a few spots, Cal. 4-fid
7205 Nearly stemless, Leaves glaucous very blunt with many dots, Cal. 2-4-fid
7206 Nearly stemless branched, Leaves subul. elong. dott. very glauc. Bractes 4 crossing shorter than scape
7207 Stemless, Leaves subulate elongated acute glauc. much dott. Bractes 2 longer than scape
7208 Like the last, but leaves half cylindr. connate warted outside
7209 Leaves obl. at the base inside with elevated pustules, Old stem three inches long decumbent
7210 Leaves papulose iced, the first pisiform, the next half round, Stem much branched corky



and Miscellaneous Particulars.

The seed should be sown in the latter end of March in a pot, which must be placed in a melon-frame; the seedling plants, while small, should be set out singly in small pots, and kept under the shelter of a cold frame, until about the twentieth of May, when the mildness of the season will probably allow of their being planted out, without risk of being killed by frost. The plants must be put out three feet apart in very rich soil. In five or six weeks from the planting, their branches will have grown sufficiently to allow the gathering of the leaves for use. In dry seasons, the plants will probably require a good supply of water. They put forth their branches vigorously as soon as they have taken to the ground, and extend before the end of the season three feet on each side.

1146. *Mesembryanthemum.* From μεσημβρια, the mid-day: on account of the flowers usually expanding at that time: the termination *anthemum*, which signifies flowering, is, to say the least of it, superfluous. The species of this extensive genus are singular, yet beautiful, and some even splendid plants. Their leaves are of odd shapes, and the habits of most of the sorts slovenly and insignificant, though some are grotesque; but the

History, Use, Propagation, Culture, flowers make ample amends by their profusion, the brilliancy of their colors, and the length of time the species continue in flower. Few are annual, fewer biennial, many are perennial, but most are shrubby,

7211 First leaves connate spheroidal, next half round subulate very long recurved green
7212 Leaves sloping graver-shaped very broad thickest on one edge at the base inside pimpled, Fl. sessile
7213 Nearly steml. Lvs. tongue-shaped thick; one convex blunt at end, the other with a long keel, Fl. stlkd. frag.
7214 Leaves obliquely tongue-shaped pale green very soft, the younger ciliated pubesc. hooked inwards at end
7215 Nearly stemless, Lvs. tongue-shaped sloping 4-inches long, 1-broad cultrate, Pedunc. an inch long
7216 Nearly stemless, Lvs. distichous tongue-shaped at the edge and end cultrate. Fl. stalked
7217 Leaves long very green and polished, Pedunc. longer than calyx, Caps. small depressed
7218 Leaves broad tongue-shaped ascending obtuse green longer than peduncles
7219 Leaves tongue-shaped ascending 5-6-in. long, 3-11-lines broad, with large pimples at the base inside
7220 Leaves long tongue-shaped shining thinner, Flowers subsessile, Caps. large depressed

7221 Leaves unequally tongue-shaped thick green partially keeled, Caps. little elevated subsessile

7222 Leaves tongue-shaped obtuse thick often sloping and a little hollowed, Caps. large conical subsessile

7223 Prostrate, Lvs. narr. tongue-shaped obt. recurved depressed variously bent inwards at end, Caps. depressed

7224 Leaves lin. tongue-shaped half cylindr. very soft cruciate, Old stem three inches long
7225 Leaves bifarious obliquely crossed half round obt. very thick yellowish green incurv. Old stem 6 in. high
7226 Stemless, Lvs. ⅓ cylin. subul. variously obliquely hooked blunt with broad smooth spots at base, Caps. flat [half included

7227 Lvs. crossing suberect or spreading half round subulate acute soft often pustulate at base, Ovary exserted [stalked

7228 Stemless, Leaves green deformed the upper longest
7229 Leaves linear linguiform half cylindrical very long

7230 Lvs. obliquely cruciate long variously obliquely deformed with one or more obscure teeth, Old stem 3-6-in.
7231 Lvs. ⅓ cylin. thick soft with two large opp. fleshy teeth beyond the midd. at the end variously and obliquely [deformed
7232 Lvs. very narr. tongue-shap. ½ round towards end oblique with 1 or 2 obsolete teeth, Old stem branch. 6 in.
7233 Nearly stemless, Leaves yellowish green spreading ovate half cylindrical rarely keeled at end
7234 Stem weak two or three inches long, Lvs. obl. ⅓-cylindr. upwards 3-cornered yellowish green
7235 Stem weak two or three inches long, Leaves half-cylindr. 3-cornered or subovate very green
7236 Leaves downy hoary or silky smooth
7237 Leaves subulate glaucous at the base above flat, Styles 8
7238 Leaves obsubulate thick obtuse green
7239 Leaves 3-cornered cylindr. subglaucous dotted 3 inches long, The old stem 3 inches closely branched
7240 Lvs. 4 in. long green roundish or cylindr. : the younger polished ½ round very green the old stems 6 in.
7241 Leaves 3-cornered rounded very thick green dotted two inches long [polished
7242 Leaves 3-cornered blunt with three rows of teeth at end, The old stem branched half shrubby

7242 Leaves half round subulate incurved with clear spots, Spots obsolete not wrinkled
7244 Leaves half round subulate incurved with clear spots, Spots large numerous with a white head
7245 Leaves half round subulate incurved with clear spots, Spots nearly middle sized with a little white point

§ 2. *Cluster-leaved. Stem about a foot high decumbent perennial, Leaves in capitate clusters, Flowers polygamous, Calyx 5-leaved.*

7246 Lvs. capit. closely clustered ½ cylindr. 3-cornered elong. recurv. somewhat glaucous, Stems roundish white
7247 Lvs. capitate closely clustered long 3-cornered half cylindr. glaucous or green, Stems angular red

7248 Lvs. somewhat clustered long ½-cylindr 3-cornered minutely wrinkled, Stems prostrate with distant joints
7249 Leaves clust. longish broad erect half cylindr. 3-cornered shining, Joints close, Styles 12

and Miscellaneous Particulars.

especially towards the base. Leaves mostly opposite, seldom alternate, thick, or succulent, of various forms. Flowers solitary, axillary, or extra-axillary, but more frequently terminating. The fruit is some-

History, Use, Propagation, Culture,

times shaped like a fig. Linnæus arranged the species from the color of the flower; Haworth chiefly from the leaves.

7250 Leaves clust. 3-cornered ½ cylindr. very long glaucous incurved, Stems scarcely angular, Joints distant

7251 Leaves in pairs corniculate incurved ½ cylindr. 3-cornered glaucous, Stems flexuose procumbent
7252 Leaves exactly cylindr. three inches long acute green, Styles 20
7253 Leaves glaucous about a foot long 3-cornered, Angles dilated with a broad furrow, Stem simple

7254 Leaves somewhat glaucous 6-7 inches long 3-cornered, Old stem simple
7255 Leaves green 3-4 inches long 3-cornered, Old stem two inches high simple erect
7256 Leaves dagger-shaped long glittering, Stem shrubby perennial
7257 Leaves glauc. about a span long bluntly 3-cornered channelled or half round, Root large tuberous fleshy

§ 3. *Trailers. Stems prostrate or creeping, angular, Calyx 5-leaved, Flowers polygynous, Leaves connate at base acutely 3-cornered.*

7258 Branches long slender spreading, Lvs. equilateral 3-corn. green hooked a little outwards at end, Fl. 3 or 2
7259 Lvs. equilateral 3-corn. glauc. much dotted straight at end lon. than joints, Edges not serr. Stems firm proc.
7260 Lvs. conn. comp. 3-corn. very green warted often short. than joints, Edges finely tooth. Branches very slen.
7261 Runners 1½ foot long slender rooting, Lvs. clustered compressed 3-corn. bright green not rough at edge
7262 Leaves long equilateral 3-cornered straight roughish at edge, Stem firm procumbent
7263 Leaves compressed 3-cornered large recurved serrulate very rough, Old stems firm decumbent [decum.
7264 Lvs. bright green clust. thick comp. 3-corn. acinacif. dott. lon. than joints with rough edges, Stems short
7265 Lvs. comp. 3-corn. acinacif. glauc. not serrated and scarcely cartilaginous at edge generally lon. than joints

7266 Lvs. comp. 3-corn. greenish rugose the edges with cartilaginous serratures generally shorter than joints

7267 Leaves acinaciform, Edges curled wavy rough

7268 Leaves acinaciform polished glaucous with entire cartilaginous edges
7269 Leaves acinaciform with the edges and keel rough and red

7270 Leaves compressed 3-cornered acinaciform and equilateral, Every edge roughish
7271 Old leaves equilateral 3-cornered green incurved three inches long blistered inside at base, Keel serrulate
7272 Leaves about two inches sharply 3-cornered, the old ones comp. with their keel upwards serrulate burnt
7273 Young lvs. incurved equilateral 3-cornered soft glauc. with a cartilaginous smoothish white edge, Styles 7
7274 Leaves acinaciform or compressed 3-cornered glauc. with a pink smooth cartilag. edge, Stems prostrate
7275 Leaves not equilateral 3-cornered greenish, Stems prostrate, Pedunc. terminal solitary winged, Styles 8
7276 Leaves equilateral 3-cornered greenish, Edges smooth cartilaginous, Stems weak prostrate
7277 Lvs. comp. 3-corn. acinacif. smooth dotted green, in the inside at the base blistered, Keel roughish at edge
7278 Leaves clustered 3-cornered acute glaucous with large rough pellucid dots, Stems filiform very weak
7279 Leaves glaucous dotted 3-cornered incurved smooth
7280 Leaves 3-cornered not dotted smooth very green half cylindrical at base
7281 Leaves clustered expanded obsoletely 3-cornered clavate obtuse green with a little point

§ 4. *Perfoliate. Leaves connate sheathing generally three-cornered upwards, usually hooked at end, Calyx 5-leaved.*

7282 Leaves 3-cornered compressed green prickly at end, Stem 2-edged decumbent
7283 Leaves erect white smooth 3-cornered thick sheathing beyond their middle with a cartilaginous edge
7284 Leaves 3-cornered subacinaciform white at edge, Keel dilated
7285 Leaves beaked connate half round subulate recurved dotted green, Stems prostrate branched knotty
7286 Leaves white thick hard dotted usually with about three spines beneath, Branches few

7287 Leaves whitish thick dotted recurved at end usually with one spine beneath, Branches many
7288 Leaves greenish with two spines beneath at the end
7289 Branches simple slender upright hard, Lvs. 3-cornered dotted white with 1-4 teeth at the back upwards
7290 Leaves quite entire very green smooth thick hooked backwards at the end
7291 Leaves acute-angled 3-cornered acum. incurved recurved green rough at edge
7292 Erect, Lvs. usually close recurved smooth green with the angles roughish above, Sheath often sharp

[rough upwards
7293 Erect roughish, Lvs. about an inch long spreading straight recurv. at end, Sheaths green smooth, Angles

and Miscellaneous Particulars.

Most of the species are so hardy, that on dry rock-work, in a sheltered part of the garden, they will endure ordinary winters. Every thing, however, depends on keeping them dry. Among the hardy sorts may be reckoned

History, Use, Propagation, Culture,

M. hispidum, striatum, barbatum, crassifolium, glaucum, uncinatum, corniculatum, &c. Hardy, and yet shewy sorts, are M. inclaudens, aurantium, perfoliatum, deltoides, barbatum, &c. These will grow and

7294 Leaves half an inch long smooth suberect, Keel not serrulate, Stem three feet high and branches erect
7295 Lvs. about three lines long horiz. and sheaths smooth, Keel rough at end, Branches very stiff and spread.
7296 Lvs. 3 lines long and more spreading thin and sheaths rough at edge, Branches filiform decumbent
7297 Lvs. somewhat compressed 3-cornered glauc. about one inch long, Branches many erect, Cal. turbinate

7298 Leaves somewhat compressed 3-cornered glaucous and the branchlets spreading

7299 Leaves distant roundish somewhat glaucous roughish with dots, Sheaths tumid at end

7300 Leaves remote greenish smooth about an inch and half long recurved at end, Sheaths tumid at end

7301 Leaves somewhat glaucous smooth clustered obtuse an inch long with a recurved point
7302 Leaves connate incurve-recurved blunt, Keel roughish at end with a sheathing line at base

§ 5. *Delta-leaved. Leaves more or less deltoid or hatchet formed. Flowers pink.*

7303 Leaves subulate 3-cornered dotted with the keel serrated backward
7304 Leaves glaucous compressed 3-cornered gladiate, Keel cartilaginous torn, Petals much longer than calyx
7305 Lvs. clust. not dotted glauc. shortly falcate gladiate, Angles cartilag. Petals much shorter than calyx
7306 Lvs. clust. compressed 3-cornered shortly acinaciform glauc. entire dotted with a cartilaginous edge

7307 Leaves distinct clust. equilaterally 3-corn. shortly acinaciform green dotted with a cartilaginous edge
7308 Lvs. subdelt. smooth very green with a gibb. entire keel, Pet. not closing: the inner imbricate very short
7309 Leaves clustered glaucous long 3-cornered deltoid, The sides not toothed, Keel entire
7310 Leaves clust. very glauc. 3-corn. deltoid toothed in three rows, Keel of the bractes and sepals entire
7311 Leaves clust. deltoid with the bractes and sepals 3-cornered glaucous toothletted in three rows

7312 Leaves 3-corn. acuminate awned green blistered inside at the base, Branches much clustered
7313 Leaves obl. ovate acute glaucous 3-corn. with a little white point at end
7314 Leaves connate at base oblong ovate half round not pointed, the winter leaves joined almost to the end
7315 Leaves acute equilaterally 3-corn. cymbiform grey obsoletely dotted with a downy fringe and recurv. point

§ 6. *Triquetrous. Leaves more or less 3-cornered distinct. Cal. 5-leaved. Styles 5.*

7316 Leaves large clustered much compressed 3-corn. incurved very glaucous, Stem woody erect bushy
7317 Leaves small much clust. somewhat connate compressed 3-corn. closely incurved, Branches clustered
7318 Leaves minute distinctly compressed 3-cornered falcate, Branches numerous filiform
7319 Leaves much compressed 3-corn. very glauc. attenuate at each end incurved, Branches much clustered
7320 Leaves compressed 3-corn. very glaucous attenuate at each end acinaciform, Stem erect

7321 Leaves 3-corn. clust. robust incurved very glaucous, Stem erect much branched
7322 Leaves much clustered thick acinaciform falcate with large spots glaucous
7323 Lvs. bluntly 3-corn. comp. glauc. incurv. atten. at each end, Pedunc. and branches erect filiform comp.
7324 Lvs. clustered falcate inflexed from 3-cornered half round compressed subglaucous smooth
7325 Leaves subtriquetrous green shining warted very rough, Sepals ovate acuminate, Petals crenate at end
7326 Leaves subtriquetrous glaucescent warted very rough, Sepals ovate-acuminate, Petals two toothed at end
7327 Leaves subtriquetrous very glaucous rough, Sepals and petals distant reflexed, Stamens clust. Bark white
7328 Erect woody, Leaves lin. obsoletely 3-corn. smoothish glauc. white imbricated at the ends of old branches
7329 Leaves subtriquetrous glauc. roughish attenuated downwards, Stems clust. deflexed, Pet. very numerous
7330 Leaves subtriquetrous glauc. attenuated upwards smooth, Keel roughish, Branches distant filiform
7331 Leaves small glauc. 3-corn. rough, Branches bushy clust. The young bark brown, Flowers panicled
7332 Leaves small often longer than the joints but inwards by pairs glauc. 3-corn. obtuse smooth
7333 Leaves much clust. strong incurved-recurved clavate compressed dotted glaucous, Branches bushy
7334 Leaves compressed bluntly 3-corn. roughish with dots glaucous, Sepals like spines spreading
7335 Leaves subglaucous subtriquetrous rough, Calyxes spiny, Petals deeply emarginate
7336 Leaves distinct remote subrecurved triquetrous much comp. dotted glauc. Keel gibbous above middle
7337 Leaves distinct distant triquetrous compressed acute subglaucous dotted, Branches twiggy
7338 Leaves green, Bractes 4 broadly ovate keeled embracing the calyx, Pet. white at base, Branches fuscous
7339 Branches decumbent 2-edged brown, Leaves acinacif. 3-corn. with sides membranous downwards, Dots [large pellucid elevated

and Miscellaneous Particulars.

flower vigorously if planted in a bed in the open air and protected during winter, or if planted in a common pit, and matted over during frost.

History, Use, Propagation, Culture,

M. nodiflorum grows wild in Italy and Egypt, and in the latter country is burnt for potash, which it produces in excellent quality.

7340 Leaves glauc. slender roughish, Bractes ovate acute almost surrounding the calyx, Branches very slender [straight

7341 Leaves glaucous, Bractes broad ovate, Branchlets clustered, Stem hoary
7342 Leaves glauc. equilateral 3-corn. very rough, Bractes ovate acute embracing the peduncles upwards
7343 Leaves 6-12 lines long half erect glauc. with little pellucid rough dots
7344 Leaves compressed 3-corn. longish bluish-green with rough pellucid dots, Keel usually onetoothed

7345 Low, Leaves green sparkling in the sun and branches very dense, Flower-stems decumbent
7346 Lowish, Lvs. glauc. 3-corner. and branches very close, Fl.-stems ascending or erect, Styles obovate twice
7347 Leaves green sparkling in the sun and branches close, Flower-stems erect [as short as stamens
7348 Lvs. close compressed 3-cornered very green, Ped. longer than bract, Flowers spreading flat in the sun
7349 Leaves compressed 3-cornered glaucous, Branches stout, Pedunc. clavate, Corolla incurved
7350 Leaves cylindrical 3-cornered, Petals orange, Styles dark purple
7351 Leaves cymbiform pale-green with large dots, Branches few 2-edged hoary
7352 Lvs. very glauc. 3-corn. compressed, Sepals obl. ovate, Pet. deep orange imbricated, Styles purple outside
7353 Lvs. acutely 3-corn. much compressed glauc. roughish, Sepals ovate cordate, Pet. sulphur, Styles yellow
7354 Leaves 3-cornered obtuse expanded glaucous with large spots, Stem much branched woody stiff erect
7355 Leaves 3-cornered spreading cymbiform glaucous, Stems branched, Branches filiform nearly erect close
7356 Lvs. distinct 3-corn. ovate granular 3 lines long, Flowers yellow opening in the evening, Stems expanded
7357 Leaves spreading turgid 3-cornered hoary bluntly dotted at edge, Branches clustered 2-edged decumbent

§ 7. *Slender, Leaves distinct, dotted, rounded, without warts, Flowers opening in the morning, red, orange, or yellow.*

7358 Lvs. rounded 3-corn. somewhat compressed obt. glauc. Pedunc. smooth at base, Sepals obt. nearly equal
7359 Leaves 3-cornered acute green, Pedunc. and cal. unequal rough, Petals yellow inside

7360 Leaves about 3-cornered very green, Pedunc. in fruit clavate, Sepals very unequal, Branches loose
7361 Leaves half round subcompressed subulate green smooth longer than joints, Stems erect or procumbent

7362 Lvs. 3-corn. compressed glauc. rough, Sepals unequal, Petals changing from yellow to pink, Stems effuse
7363 Branches and lvs. cylindrical subul. spiniform erect recurved at end, Pedunc. and keels of bractes rough

7364 Lvs. distant expanded at base incurv. half round subul. Branch. firm suberect roughish angul. compressed
7365 Lvs. 3-cornered subulate incurved below hooked at end, Branches filiform compressed wavy decumbent
7366 Leaves clustered half cylindrical acuminate much recurved at end, Branches erect very close
7367 Tufted, Leaves clustered half cylindrical acuminate with filiform very weak creeping stems
7368 Leaves rounded 3-cornered dotted distinct, Spines branched
7369 Leaves long rounded 3-cornered subulate incurved glaucous edged at base
7370 Leaves rounded incurved smooth thickest in middle glaucous, Stem straight branched
7371 Flowers terminal 3, Two sepals deeply divided
7372 Leaves subulate rounded 3-cornered acute somewhat incurved very glaucous, Bark chestnut-colored
7373 Leaves clustered cylindrical obtuse arcuate glaucous smooth
7374 Leaves connate at base very close and glaucous 3-cornered cylindrical soapy, Flowers afternoon

7375 Leaves clustered 3-cornered half cylindrical mealy obtuse shorter than joint soapy, Sepals very unequal

§ 8. *Warted, Leaves and branches almost always more or less warted, Root biennial or annual.*

7376 Leaves large ovate acute wavy frosted with three nerves beneath, Root biennial
7377 Leaves large altern. ovate much wavy, as are the stems and cal., bespangled with ice drops, Root annual
7378 Leaves oblong pinnatifid pimpled, Petals minute yellow
7379 Leaves flat spatulate and stems pimpled, Branches divaricating, Fl. sessile

7380 Leaves amplexicaul. spatulate keeled, Pimples conical rough, Petals very minute
7381 Leaves opp. and altern. ovate spatulate wavy pimpled, Branches and calyxes angular, Fl. afternoon
7382 Leaves altern. lanceolate bluntish pimpled, Calyxes stalked crystalline

7383 Leaves stalked cordate ovate, Stems procumbent spreading, Cal. 4-cleft 2-horned
7384 Leaves broad lanceolate flattish smooth ciliated distinct, Stem peduncle and ovaries hairy

7385 Leaves opp. lanc. acute subciliate, Pedunc. solitary subterminal very long hairy, Sepals lanceolate
7386 Lvs. lin.-lanc. ciliated, Stems branched effuse, Pedunc. bractes and cal. shorter than flower woolly villous
7387 Leaves lin.-lanc. scarcely spatulate and calyx ciliated, Sepals linear thick or turgid, Pedunc. scabrous
7388 Leaves spatulate flat smooth, Pedunc. very long, Cal. flat at base angular
7389 Leaves opp. spatulate blunt rough, Pimples oblong, Sepals oblong blunt contracted in middle

and Miscellaneous Particulars.

M. crystallinum is a popular hothouse annual, which does well in the open air in the summer season.
M. umbellatum forms one of the handsomest shrubs of the genus, standing without support with a stout

History, Use, Propagation, Culture,

stem, two or three feet high, with terminating white flowers, which open, when the sun shines, from seven or eight in the morning to two or three in the afternoon, and smell like those of the hawthorn. The fruit of M. edule is eaten by the Hottentots and Dutch inhabitants of the Cape, and is called Hottentots' figs.

7390 Leaves linear inflexed channelled blunt rough, Pedunc. and calyx jewelled with crystals

7391 Leaves pubescent connate not dotted, Stem hairy
7392 Leaves filiform half round distinct, Pimples ovate, Fl. lateral sessile: the terminal surrounded by a pair [of leaves
7393 Leaves amplexicaul. distinct linear flat above pimpled longer than joints, Fl. stalked
7394 Leaves alternate roundish obtuse ciliated at base
7395 Leaves opp. connate half round, Stipules membranous reflexed torn fringe-like
7396 Leaves half round papulose distinct, Fl. sessile axill. Cal. 4-cleft
7397 Leaves alternate lanceolate flat not dotted, Stems lax simple, Cal. 5-cornered
7398 Leaves flattish lanceolate not dotted spreading distinct opp. and altern. remote
7399 Leaves lanc. acuminate keeled fleshy bluntly 3-cornered channelled, Pedunc. very thick
7400 Leaves flattish oblong ovate papulose clustered connate, Cal. 3-leaved 2-horned
7401 Leaves amplexicaul. glaucous distinct obl. lanc. inflexed concave, Sepals ovate obl. longer than cor.
7402 Leaves lorate long channelled inflexed blunt very glaucous convex beneath, Sepals obtuse as long as cor.
7403 Lvs. lorate obl. blunt glauc. livid channelled dotted papulose keeled, Stems branched rounded decumbent
7404 Leaves lorate acuminate green smooth, Stem very short and thick
7405 Leaves lanc. elliptical crystalline when dead having only the nerves remaining, Stems procumbent

7406 Leaves connate ovate papulose, Branches erect clustered
7407 Leaves lanc. lin. somewhat channelled convex beneath, Fl. solitary terminal [acute
7408 Lvs. clustered papulose erect somewhat imbricate subul. half round, Fl. ternate cymose, Sepals digitiform
7409 Leaves half round not dotted recurved distinct close, Cal. terminal finger-shaped
7410 Lvs. close flexuose recurved very green half round, Sepals finger-shaped, Stems flexuose shining slender
7411 Leaves acuminate green, Sepals 2 much elongated
7412 Leaves close linear subulate half round pale green deeply channelled, Sepals acute
7413 Leaves close flexuose reflex subulate half round glaucous, Sepals equal 3 membranes on each side

7414 Leaves distinct roundish pimpled, Stem erect, Branchlets 1-flowered
7415 Leaves opposite amplexicaul. distichous oblong-lanceolate acute bluntly keeled, Pimples minute
7416 Leaves lanc. linear keeled not dotted distinct, Flowers stalked, Two sepals very long

7417 Lvs. subulate half round acute remote, Fl. term. dichotomous, Sepals very unequal, Branches sometimes
7418 Branches round granular closely dotted [rush-formed
7419 Leaves very slender 1-sided effuse, Leaves erect linear very fine
7420 Branches procumbent knotted at the base, Spines of the leaves very long
7421 Leaves close half round channelled, Stem and branches erect thick
7422 Leaves lin. round obtuse narrowed at each end, Old stem strumose at base, Branches effuse
7423 Branches filiform weak long prostrate, Old roots strumose above, Leaves lin. furrowed longer than joints
7424 Leaves lin. half round with shining pimples, Stems procumbent filiform
7425 Leaves half round pimpled hairy, Cal. hairy, Stem thick, Branches diffuse knotty
7426 Leaves half round blunt channelled spreading iced, Branches diffuse weak cinereous
7427 Beautifully pimpled all over, Leaves half round, Branches knotty slender, Fl. small dichotomous
7428 Stems and leaves cylindrical pimpled, Branches dichotomous
7429 Leaves expanded compressed 3-cornered somewhat hoary soft recurved at end mucronate
7430 Leaves half round somewhat triquetrous glaucous, Fl. 3-chotomous testaceous, Stem erect shrubby
7431 Leaves subtriquetrous compressed minutely pimpled recurved at end, Old root tuberous large
7432 Leaves remote obsoletely cylindrical glaucous, Fl. 2 ternate cymose, Bark white

7433 Leaves remote subcylindrical glaucous exactly half erect, Fl. ternate, Bark cinereous
7434 Leaves half round, Pedunc. terminal aggregate clavate cymose
7435 Leaves remote half cylindrical glaucous exactly horizontal, Fl. ternate
7436 Leaves half cylindrical subul. subacute incurved sparkling, Sepals and petals obtuse, Cor. funnel-shaped
7437 Leaves half cylindrical obtuse subrecurved much sparkling, Sepals and petals subacute
7438 Leaves expanded remote blunt compressed subcylindrical, Stems very rough spotted
7439 Leaves half round narrowed at each end sparkling incurved erect variously bent, Branches filiform
7440 Leaves distant cylindrical blunt small shining pimpled: one of each pair deflexed, Branches hard suberect
7441 Leaves graniform expanded bluntly 3-cornered papulose shining, Branches hard rough erect
7442 Leaves cylindrical blunt spreading short, Branches numerous diffuse filiform
7443 Leaves expanded very short or globose cylindrical, Branches numerous filiform divaricating decumbent
7444 Leaves cylindrical 3-cornered obtuse with white dots, Calyx 6-cleft
7445 Leaves cylindr. very blunt and cal. smooth obconical green pimpled sparkling, Stamens longer than styles

7446 Leaves close cylindrical blunt with crystalline pimples, Cal. turbinate hairy, Stamens length of styles
7447 Leaves cylindrical incurved crystalline hoary blunt sparkling, Branches long weak procumbent
7448 Lvs. subcylindr. incurv. pimpl. obt. Cal. hemispheric. pimpl. hairy cluster. Branch. numerous spreading

and Miscellaneous Particulars.

Mr. Haworth's arrangement of the genus, which is the only intelligible one, is here followed.

Respecting the general culture of the genus, Sweet observes, "the dwarf kinds require but little water, and to be grown in small pots in a very sandy or gravelly soil. The species should be kept quite dry when in a dormant state;

History, Use, Propagation, Culture,

but when growing freely, and at the flowering season, they require a moderate supply of water. The stronger and more woody kinds may be planted in a richer soil; but the poorer the soil is, the dwarfer they will grow, and the more abundantly they will flower; they also require more water than the dwarf kinds, particularly at the flowering season, but need very little in winter. A good dry frame is sufficient to preserve them through the winter, with the covering of mats in frosty weather. Cuttings of any of them strike root readily, planted in pots of earth, and kept dry till they begin to wither; when they may have a little water, and they will root very soon. (*Bot. Cult.* 224.)

1147. *Hymenogyne.* From ὑμην, a membrane, and γυνη, a woman, or, in botanical language, a style, in allusion to the cohesion of the styles into a membranous tube. An artificial division of Mesembryanthemum.

1148. *Rosa.* From *rhos*, signifying red in Armorican, whence ῥοδον, Greek, and *rosa*, Latin. The rose has been a favorite flower from time immemorial among the civilized nations of Europe and Asia. The shrub varies in size in different species, from one foot to six or eight, and the colors are red, white, yellow, purple, striped; simple, or in almost numberless shades and mixtures; the flowers are single, semi-double, and double. The odour is universally grateful. It is cultivated in every garden, from that of the most humble cottager upwards; some species, as R. centifolia, damascena, &c. are also cultivated by commercial gardeners on a large scale for distilling rose water, and for making attar, or essential oil of roses. Six pounds of rose leaves will impregnate by distillation a gallon of water strongly with their odor; but a hundred pounds affords scarcely half an ounce of attar. The rose is also used in medicine. Botanists are not agreed as to the number of

7449 Lvs. subcylindr. incurved pimpled obt. hoary, Cal. hemispheric. pimpled numerous, Stamens longer than

and Miscellaneous Particulars.

original species of this genus: some regard all the European species as originated from one source; others, and especially the moderns, divide them into species, subspecies, and varieties. The most scientific work which has appeared in England on roses is the Rosarum Monographia of Mr. Lindley, 1819, in which above a hundred species or subspecies are described, and some of them figured; Miss Lawrence has published ninety plates of A Collection of Roses from Nature, 1810. In France, Guillemeau has published Histoire Naturelle de la Rose, 1800; and Redouté and Thory are engaged in a splendid work, in folio, entitled Les Roses, containing plates of all the known species and varieties of this flower. Thory has published a separate tract on their culture, entitled Prodrome de la Monographie du Genre Rosier, &c. 1820; Pronville, a Nomenclature Raisonnée, in 1818; and Vibert, Observations, &c., in 1820. A copious and intelligent account of the Scotch roses has been given by Mr. Sabine (*Hort. Trans.* iv. 231.), and some hundreds of new varieties have flowered from seedling plants in the Hammersmith nursery, and will soon be found in the sale catalogues.

Species and varieties. The lists of the London and Paris nurserymen contain upwards of 500 names: that of Calvert and Co., Englishmen, who have established a nursery at Bonne Nouvelle near Rouen, enumerates near 900 sorts. The greater part of these have been raised, within the last thirty years, from seed on the continent, where it ripens better than in this country. A number of varieties have also been raised in Britain, especially of the R. spinosissima, or Scotch rose, of which above 300 varieties are procurable in the Glasgow nursery. New varieties are raised in France and Italy annually; Villaresi, royal gardener at Monza, has raised upwards of fifty varieties of Rosa indica; not one of which has, as far as we know, reached this

country. Some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous. The most remarkable only are here arranged under the species to which they are referable.

A modern invention, of Dutch origin, in the culture of roses, is that of forming standards, by budding on stocks of any of the hardy woody growing sorts, as the dog rose, R. canina, or the tree rose, R. villosa. They are budded at different distances from the ground, according to taste and the purposes in view, and form, after a few years, handsome round heads, which flower freely, and preserve the variety a longer time than in plants raised from cuttings or layers. They are particularly valuable for shrubberies and lawns, where the culture at the root required by dwarf roses could not be given, and if omitted would occasion the degeneracy of the variety.

New varieties of the rose are obtained from seed; but the usual mode of propagation is by layers. All will grow by cuttings, and some, as the sempervirens, freely; but that mode is seldom resorted to. For preserving delicate varieties, the best mode seems decidedly that of budding on hardier sorts.

No species of rose, wild or cultivated, thrives well in or very near large towns, on account of the smoke and confined air. The yellow and Austrian roses (R. lutea and R. bicolor) are difficult to flower in any situation, but seldom or never blow in the suburbs of London: even the monthly rose does not thrive so well there as at some miles distance in the country. Roses are generally planted in the front of shrubberies, and in borders; they are also planted by themselves in rose gardens or rosaries, in groups on lawn, either with common edgings, or with edgings of wire, in imitation of basket-work. These last are called baskets of roses; the ground enclosed in the basket-margin is made convex, so as to present a greater surface to the eye, and increase the illusion; the shoots of the stronger sorts are layered or kept down by pegs till they strike roots

into the ground, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells. Under this treatment, the whole surface of the basket becomes, in two or three years, covered with rose-buds and leaves of one or of various sorts. Where one of the larger free-growing sorts is employed, as the moss, or any of the Provence varieties, one plant may be trained so as to cover a surface of many square yards. Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colors of their flowers. By mixing small-flowered with large showy sorts, the beauty of the former is lost without adding to the effect of the latter.

In rosaries, commonly, but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctions are better seen. Particular compartments are often devoted to one species, as the Scotch, Chinese, yellow, burnet-leaved, &c. which has an excellent effect; sometimes a piece of rock-work in the centre is covered with the creeping roses, and on other occasions these are trained to trellis-work, which forms a fence or hedge of roses round the whole. In this hedge, standard roses are sometimes introduced at regular distances; a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds.

Standard roses, however, have certainly the best effect in flower borders, or when completely detached on a lawn: their sameness of form, and that form being compact and lumpish, prevents them from grouping well, either among themselves or with other objects. Their beauty consists in their singularity as rose plants, and in their flowers; and, therefore, to display these beauties to the best advantage, they require to be seen singly, or in succession. This is the case where they occur as single objects on a lawn, or in the centre, and here and

there among groups of flowers; or in lines or avenues, along flower walks. In the gardens of the Grand Trianon, they are planted profusely in large masses, like plantations of trees and shrubs, and there much of their individual beauty is lost, and no good general effect produced.

Most species of the rose, in their wild state, grow in sandy and rather poor soil, except such as are natives of woods, where the soil is richer, and comparatively moist. But all the cultivated roses, and especially the double-flowering kinds, require a rich loamy soil, inclining to clay rather than sand; and they require also, like most double flowers, plenty of moisture when in a growing state.

To produce strong flowers, roses require some attention to pruning; old wood should be yearly cut out, and the young shoots thinned and shortened according to their strength, and whether number or magnitude of flowers be wanted. Those sorts which throw up numerous suckers should be taken up every three or four years, reduced, and replanted; and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil, and replace it by new. The points of the shoots

of the more delicate sorts of roses, are very apt to die when pruning is performed in winter or spring; to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month. A very good time for performing the operation, is immediately after the bloom is over; cutting out old exhausted wood, shortening shoots which have flowered to a good bud accompanied with a healthy leaf, but leaving such shoots as are still in a growing state untouched till October. Where very large roses are wanted, all the buds but that on the extreme point of each shoot should be pinched off as soon as they make their appearance, and the plant liberally supplied with water. To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half-rotten stable-dung, or partially rotten leaves.

The earliest flowering rose is the monthly, which, in mild seasons, and planted against a wall, will sometimes flower in the beginning of April; the roses next in succession are the cinnamon, which flowers in May; the damask in the end of May or beginning of June; the blush, York and Lancaster, Provins, and Dutch

hundred-leaved, in June, July, and August. The Virginia and musk roses are the latest European sorts; they flower in September, and in shaded situations will sometimes continue in bloom till the middle of October; but the earliest rose (the monthly) is also the latest, and generally continues flowering till interrupted by frost. The earliest sorts may be materially forwarded by being planted against a south wall; and if portable sashes are placed before them, and the wall is either flued and heated by fires, or a lining of dung placed behind, the plants may be brought to flower in February or March. The monthly rose being protected by glass in autumn, or aided by artificial heat, may be continued in bloom till Christmas. A very

common mode of obtaining late roses, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots, of every kind, early in spring; a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

The best roses for forcing are the common and moss Provence; the Indian sorts force well, or rather, in stoves, continue in bloom all the year; but the commoner varieties of these not being fragrant, they are in less repute than the European roses. Rose plants should be a year in pots previously to the autumn when it is intended to force them; they should be planted in pots of six or eight inches diameter, in rich loam, and

History, Use, Propagation, Culture,

plunged in an open airy situation; their flower buds pinched off as they appear; and the plants put early into a state of rest, by excluding the sun and rain, but not a free circulation of air.

All the species of roses are very liable to the attacks of insects, especially of the aphides; some, and especially the briar and Scotch rose, are attacked by the Cynips rosæ, which, by puncturing the bark, occasions the production of rose-galls, and of those mossy tufts often seen on wild roses, which were known formerly under the name of Bedeguar, and used in medicine. Under cover tobacco smoke will prove an effectual remedy for the aphides; but the larvæ of many others, and especially of tipula and the tenthredinidæ, which occasion the wrapping up and shrivelling of the leaves, can only be removed by washing with lime-water or hand picking.

1149. *Rubus.* From the Celtic *rub*, which signifies red. Many of the species are only biennial woody plants, producing suckers or stolones from the roots, which ripen and drop their leaves one year, and resume their

7553 Lvs. ternate, Leafl. ovate acute unequally serrate downy beneath, Stem pet. and ped. unarmed
7554 Leaves simple palmate, Stem unarmed many-leaved many-flowered
7555 Leaves pinnate about 7 hairy beneath: the upper ternate, Stem ascending with small straight prickles

and Miscellaneous Particulars.

foliage, produce blossom shoots, flower, and fruit, and die the next. The common raspberry and bramble are examples.

R. idæus is a native fruit, greatly improved by cultivation; it has a grateful subacid taste, and like the strawberry, is one of the few fruits that does not undergo the acetous fermentation in the stomach. There are red and yellow varieties, and one very excellent sort that bears twice a-year, in July and September. The raspberry requires a soft rich moist soil, and if a plant stands singly or a single row is planted by itself, the situation should be gently shaded. Where a plantation is made of several rows together it may be placed in the open garden, as the plants will shade one another to a sufficient degree. Frequent renewal is necessary to prevent the stools getting large and matted when they send up only weak suckers. No more suckers should be left at the stools than are intended to bear the following year, unless young plants are wanted; and if very

History, Use, Propagation, Culture,

large fruit is the object, no suckers should be left at all: on the contrary, when the strongest suckers are wanted, the fruit-bearing shoots should be cut down.

R. occidentalis is a showy plant for large shrubberies. The fruit of R. cæsius is blue, edible, and it continues till frost. R. corylifolius and fruticosus are both common in our hedges; the shoots of the latter are much tougher than those of the former, and are preferred by thatchers for binding their roofs, and by straw-hive and mat makers. The berries, eaten at the moment they are ripe, are cooling and grateful; a little before, they are coarse and astringent; and a little after, disagreeably flavored or putrid. They are sometimes made into pies; but great care is requisite in gathering the fruit, for one berry of the last sort will spoil a whole pie. The double-flowering variety is considered very ornamental.

The fruit of R. arcticus and chamæmorus is eaten in the north of Scotland and [illegible]den. In the latter country, Dr. Clarke informs us, it is much prized in soups, sauces, and for [illegible] vinegar; and Dr. Clarke was cured of a bilious fever by eating great quantities. The plant is rather dif[illegible] to preserve in gardens, but by raising successive generations from the seed it might perhaps be subjected to [illegible] same culture as the cranberry. The fruit of R. pauciflorus, the Nepal raspberry, is very agreeable.

1150. *Dalibarda.* Denis Dalibard was a French botanist, who published, in [illegible], a catalogue of the plants in the neighbourhood of Paris. Small plants, resembling the little species of Rubus.

7556 Leaves simple cordate somewhat lobed downy beneath, Stem prickly decumbent
7557 Branches round villous, Lvs. cordate obl. 5-lobed : the middle lobe elongated, Stip. and bractes pectinate

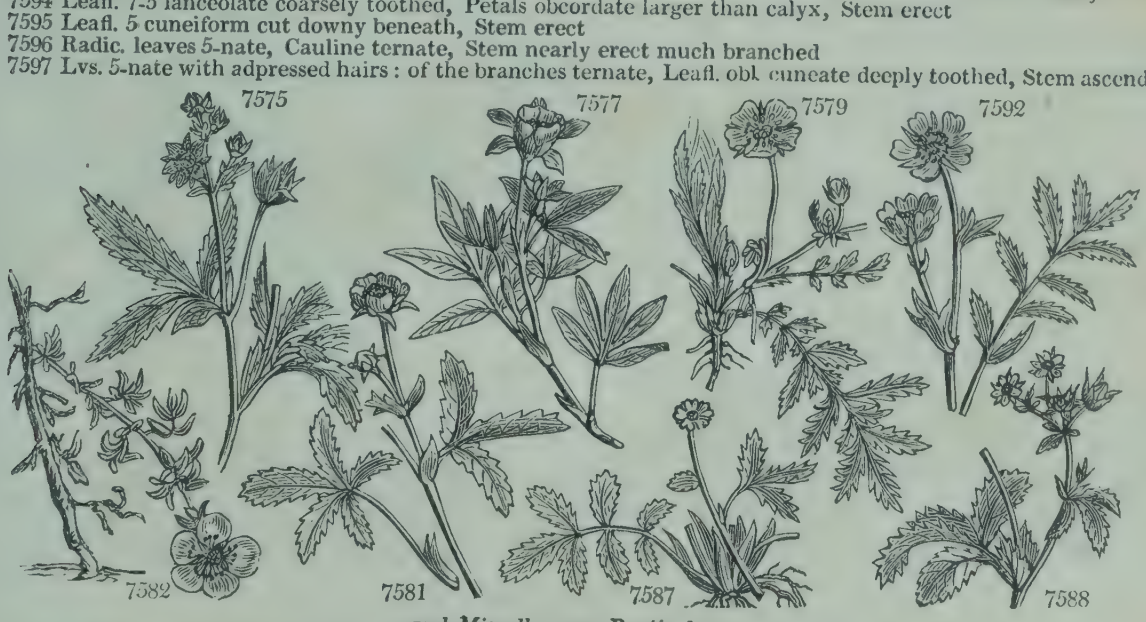
7585 Lvs. bipinnatifid in many pairs downy on each side : segments parallel approximating, Stem decumbent
7586 Lvs. bipinnatifid in four pairs smooth above downy beneath : segments distant, Stem decumbent
7587 Leaves pinnate : the outer largest, Runners creeping
7588 Rad. leaves subpinn. cauline tern. Leafl. lanc. unequally coarsely serrate hairy on each side
7589 Leaves pinnate alternate, Leafl. 5 ovate crenate, Stem erect
7590 Leaves pinnate nearly equal, Leafl. oblong subbifid : the outer confluent
7591 Leaves pinnate, Leafl. roundish toothed equal, Stem erect
7592 Leaves pinnate upper ternate, Leafl deeply toothed, Stem erect pubescent
7593 Leaves pinnate, Leafl. oblong deeply toothed, Stem decumbent dichotomous, Pedun. axill. solitary
7594 Leafl. 7-5 lanceolate coarsely toothed, Petals obcordate larger than calyx, Stem erect
7595 Leafl. 5 cuneiform cut downy beneath, Stem erect
7596 Radic. leaves 5-nate, Cauline ternate, Stem nearly erect much branched
7597 Lvs. 5-nate with adpressed hairs : of the branches ternate, Leafl. obl. cuneate deeply toothed, Stem ascend.



and Miscellaneous Particulars.

1151. *Fragaria.* From *fragrans*, in allusion to the perfumed fruit. *Fraisier*, Fr, *Erdbeere*, Ger., and *Tragolo*, Ital. This is a genus of fruit-bearing herbaceous plants, of which there are few in the vegetable kingdom, and none to equal the strawberry in wholesomeness and excellence. This fruit is universally grateful, alone, or with sugar, cream or wine; and has the property, so valuable for acid stomachs, of not undergoing the acetous fermentation. Besides the species or subspecies enumerated, there are upwards of sixty mongrel varieties or different names, some of which, recently produced from seed, are of great excellence. The strawberry is not only a valuable and easily cultivated out-door fruit, but forces well, and with a little trouble in choosing a succession of sorts, they may be had at the dessert every month in the year, though during the three winter months they are without flavor.

In cultivating the strawberry, an open situation and rich loamy soil, rather strong, is required for most varieties; and from their large progress of foliage and flowers, they must, till the fruit is set, have copious supplies of water. The row culture is most convenient, and frequent renewal insures vigorous plants and large fruit.

1152. *Comarum.* A name given by the Greeks to the Arbutus. The Comarum of the moderns produces a fruit not unlike that of the Arbutus.

1153. *Potentilla.* In allusion to its supposed *potential* virtues in medicine. These, however, appear to con-

History, Use, Propagation, Culture,

sist of nothing beyond a slight vulnerary quality. P. fruticosa and floribunda are shewy shrubs. P. anserina is remarkable for the silvery whiteness of its foliage, which is eaten by geese, as the roots were once by the country people in some places. All the species are pretty, and deserving cultivation.

1154. *Tormentilla.* From *tormina*, the dysentery, which this plant was formerly employed for curing. T. erecta was once a plant of some importance in œconomy and medicine. The roots are still used in most of the Western Isles of Scotland and in the Orkneys for tanning leather, for which they are superior even to oak-bark. They are first boiled in water, and the leather is then steeped in the cold liquor. In the islands of Tirey and Col, the inhabitants have destroyed so much ground by digging them up, that they have been prohibited the use of them. They are also used for dying of a red color. And Mr. Young informs us, that many swine are reared with them on the mountains of Killarney.

In the London Materia Medica it is employed in intermittents, and as a local application in the form of gargle and lotion, in ulcerations of the tongue and mouth, against spongy gums, and as an application to fœtid ill conditioned sores; but it is seldom used. (*London Dispensatory*, 538.)

1155. *Geum.* From γευω, to taste well. The roots of G. urbanum have a mildly astringent aromatic taste, somewhat like that of cloves, whence this plant has the name of Caryophyllata. They should be gathered in dry warm situations, for in shady moist places they have little virtue. Gathered in the spring, and put fresh into ale, they give it a pleasant flavor, and prevent its turning sour. Infused in wine, it is esteemed a good

7634 Leaves toothed

and Miscellaneous Particulars.

stomachic; but in water, Haller affirms it to have been attended with bad effects, when given in malignant fevers, producing delirium. Chewed in the mouth, the roots take off from a disagreeable breath.

1156. *Kerria.* So named after Mr. William Ker, a botanical collector, who was sent some years since to China, whence he sent many curious plants. The plant named after him is the common Corchorus japonica of the gardens.

1157. *Calycanthus.* From καλυξ, and ανθος, a flower; the calyx being colored and similar to petals, which are not present in the genus. Small North American shrubs, with chocolate-colored blossoms. The flowers of C. floridus have an agreeable scent like those of allspice, and is so called in Carolina.

1158. *Chimonanthus.* From χειμων, winter, and ανθος, a flower, in allusion to the period of the year when its blossoms are produced. C. fragrans is highly odoriferous, and though hardy, deserves a place in the front border of a conservatory, on account of the odor it disperses early in spring.

1159. *Dryas.* A name poetically applied to this little plant, from the resemblance of its leaves to those of the oak, which was sacred to the Dryads. This is a delicate evergreen plant, and with its snow-white blossoms is a great ornament to alpine heights. The stalk and branches are woody and perennial, lying flat upon the ground, and spreading wide about the root in tufts.

It requires some care to preserve it in gardens, and grows better in a shaded bed of peat than in pots.

History, Use, Propagation, Culture, .

1160. *Coluria.* From κολυρος, deprived of the tail; or, as we usually say in English, bob-tailed. Distinguished by Mr. Brown from Geum, principally on account of the deciduous nature of the style or tail of the grains.

Class XIII. — POLYANDRIA. Stamens many, hypogynous, or inserted under the Ovary.

This class agrees with the last in having hermaphrodite flowers, with an indefinite number of stamens, which neither cohere in any part of their length, nor are distributed in distinct parcels; but it is distinguished by the stamens being inserted distinctly from the floral envelopes, immediately under the ovary, into what has been called the *receptacle* by Linnæus and his followers; *torus*, by Mr. Salisbury; and *thalamus*, by some other botanists. The class consists of the greater part of several extensive natural orders, such as Ranunculaceæ, Magnoliaceæ, Cistineæ, &c.; and, like the last, is replete with subjects of interest to gardeners and florists. The various kinds of Clematis form the most valuable portion of the hardy climbing plants of the verandah. The brilliant varieties of the ranunculus and anemone constitute the most attractive part of the flower garden. Pæonia, well known for the richness of its coloring, and the robustness of its constitution, is the ornament of every cottage; and the noble varieties of Magnolia, the pride of the North American forest, are the finest exotics of the shrubbery. Nymphæa and Nelumbium are beautiful genera of aquatic plants. Annona, or the custard apple, is one of the most important of the fruit trees of tropical countries; and the celebrated water vine of Sierra Leone is a species of Tetracera. Nor must Sarracenia, with its curious pitcher-like leaves; Papaver, from which opium is extracted; Cimicifuga, whence is obtained the antidote to the dangerous bite of the rattle-snake; Bixa, or the arnotta tree, from the fruit of which the coloring matter for the red cheese of England is procured; nor Hepatica, with its modest beauties, be omitted.

The commencement of M. Decandolle's laborious Systema Vegetabilium has included nearly every thing contained in the class, and is followed in the discrimination of the species, as being the best authority which can be taken.

Order 1. MONOGYNIA. Stamens many, hypogynous. Style 1.

1162. *Capparis.* Cal. 4-leaved, coriaceous, deciduous. Petals 4. Stamens long. Stigma capitate. Berry with a rind, 1-celled, stalked, subglobose, or like a pod.
1163. *Marcgraavia.* Cal. 6-leaved, imbricated. Corolla monopetalous, calyptriformis. Berry many-celled, many-seeded. Style O.
1164. *Actæa.* Cal. 4-leaved, deciduous. Petals 4. Berry 1-celled. Seeds half orbicular.
1165. *Sanguinaria.* Cal. 2-leaved. Petals 8. Pod ovate, 1-celled.
1166. *Podophyllum.* Cal. 3-leaved. Petals 9. Berry 1-celled, crowned with the stigma.
1167. *Chelidonium.* Cal. 2-leaved. Petals 4. Pod 1-celled, linear. Dissepiment O. Seeds several, crested.
1168. *Romeria.* Petals 4. Caps. long, 2-3-4-valved; the valves opening from the vertex to the base. Seeds reniform, scurfy, without a glandular crest.
1169. *Glaucium.* Cal. 2-leaved. Petals 4. Pod 2-celled, linear, 2-3-valved. Seeds several, dotted.
1170. *Papaver.* Cal. 2-leaved. Petals 4. Capsule 1-celled, opening by pores under the persistent stigma.
1171. *Meconopsis.* Petals 4. Style short. Stigmas 4-6, radiating, convex, distinct. Capsule opening with 4-6 valves.
1172. *Argemone.* Cal. 3-leaved. Petals 6. Capsule half valved.
1173. *Sarracenia.* Cal. double, 3-5-leaved. Petals 5. Caps. 5-celled. Style with a clypeate stigma.
1174. *Nymphæa.* Sepals at the base of the discus. Petals and stamens connected with the whole of the discus, which covers the carpella.
1175. *Limnocharis.* Sepals 3. Petals 3, very delicate, withering. Plant monocotyledonous.

7635 Stem about 2-flowered, Awns straight naked, Cal. of fruit erect, Lvs. pinnate toothed

7636 Leaves pinnate: the outer leaflet very large round, lower smaller by degrees
7637 Leaves pinnate cut, Runners creeping

and Miscellaneous Particulars.

1161. *Sieversia.* Named by Willdenow, after M. Sievers, a well known Russian botanical collector. Plants resembling Geum in habit.

1176. *Nuphar.* Sepals, petals, and stamens inserted at the base of the discus.
1177. *Euryale.* Sepals, petals, and stamens united with the discus, which covers the carpella.
1178. *Bixa.* Cal. 5-toothed. Petals 10. Capsule hispid, 2-valved.
1179. *Prockia.* Cal. 3-leaved, besides two extra leaves at base. Cor. O. Berry 5-angled, many-seeded.
1180. *Sloanea.* Cal. 1-leaved, 5-9-fid. Cor. O. Anthers united to filaments beneath the end. Caps. echinate, 3-6-celled, 3-6-valved. Seeds 2, with a berried arillus.
1181. *Apeiba.* Cal. 5-leaved. Petals 5. Caps. echinate, many-celled.
1182. *Sparmannia.* Cal. 4-leaved. Petals 4. Filaments cohering at base, torulose. Capsule echinate, 5-angled, 5-celled. Cells 2-seeded.
1183. *Entelea.* Sepals 4-5. Petals 4. Stamens indefinite, uniform. Anthers roundish, incumbent. Stigma denticulate. Caps. roundish, echinate, 6-celled, half 6-valved, many-seeded.
1184. *Muntingia.* Cal. 5-parted. Petals 5. Berry 5-celled, 1-5-many-seeded.
1185. *Grewia.* Cal. 5-leaved, coriaceous, colored inside. Petals 5. Scales 5. Ovary usually stalked. Drupe 4-lobed, 4-celled. Nut 1-2-seeded.
1186. *Tilia.* Cal. 5-parted. Petals 5. Capsule coriaceous, globose, 5-celled, 4-valved, opening at base, 1-seeded.
1187. *Corchorus.* Cal. 5-leaved, deciduous. Petals 5. Style scarcely any. Stigma 1-3. Capsule pod-shaped, 2-celled, 2-5-valved, many-seeded.
1188. *Grias.* Cal 4-cleft. Petals 4. Stigma sessile, cruciate. Drupe with an 8-furrowed nut.
1189. *Calophyllum.* Cal. 4-leaved, colored. Petals 4. Drupe globose.
1190. *Mammea.* Cal. 2-leaved. Petals 4. Berry very large, 4-seeded.
1191. *Ochna.* Cal. 5-leaved. Petals 5. Berries 1-seeded, with a large roundish receptacle.
1192. *Elæocarpus.* Cal. 5-leaved. Petals 5, torn. Anthers 2-valved at end. Drupe with a curly nut.
1193. *Alangium.* Cal. 6-10-toothed, superior. Petals 6-10, linear. Berry coated, 1-3-seeded.
1194. *Mentzelia.* Cal. 5-leaved. Petals 5. Capsule inferior, cylindrical, many-seeded.
1195. *Lagerstromia.* Cal. 6-cleft, campanulate. Petals 6. Stamens many, of which the six outer are thickest. Caps. 4-6-celled, many-seeded.
1196. *Ægle.* Cal. 1-leaved, 5-lobed. Petals 5, spreading. Style short, thick. Berry coated, turbinate, globose, finally woody, with 12-16 cells.
1197. *Cistus.* Cal. 5-leaved, with two small leaflets. Petals 5. Caps. 5-celled; the valves bearing the dissepiments in the middle.
1198. *Helianthemum.* Divisions of the calyx often unequal: the two outer the smallest. Caps. 1-celled, 3-valved, with the dissepiment in the middle of the valves.

Order 2. DI-TRIGYNIA. Stamens many, hypogynous. Styles 2-3.

1199. *Bauera.* Cal. 7-9-leaved, persistent. Petals 7-9, deciduous. Caps. inflated, 2-celled, many-seeded.
1200. *Fothergilla.* Cal. truncate, entire. Cor. O. Filaments very long, clavate. Ovary bifid. Caps. 2-celled, 2-horned. Seeds solitary, bony.
1201. *Curatella.* Cal. 5-leaved. Petals 4. Styles 2. Caps. 2-parted. Cells 2-seeded.
1202. *Pæonia.* Cal. 5-leaved. Petals 5. Style O. Caps. many-seeded, like a pod.
1203. *Hibbertia.* Stamens distinct, filiform, equal. Anthers oval, oblong. Ovaries 1-15. Styles filiform, inflexed. Carpella membranous, generally 1-2-seeded.
1204. *Delphinium.* Cal. O. Petals 5. Nectary bifid, cornute behind. Siliques 3-1.
1205. *Aconitum.* Cal. O. Petals 5; the upper vaulted. Nectaries 2, hooded, stalked, recurved. Siliques 3-5.
1206. *Trachytella.* Carpella 1-2, berried, many-seeded; otherwise Tetracera.

Order 3. PENTAGYNIA. Stamens many, hypogynous. Styles 5.

1207. *Cimicifuga.* Cal. 4-leaved. Cor. with four urceolate nectaries. Caps. 4. Seeds scaly.
1208. *Aquilegia.* Cal. O. Petals 5. Nectaries 5, horned between the petals. Caps. 5, distinct.

1209. *Nigella.* Cal. O. Petals 5. Nectaries 5, trifid between the corolla.
1210. *Reaumuria.* Cal. 5-leaved. Petals reflexed, 5. Caps. 5-celled, 5-valved, many-seeded. Seeds woolly.
1211. *Colbertia.* Ten stamens much longer than the others. Carpella 5, united? Stigma capitate. Seeds several in each cell, reniform, inclosed in a pellucid pulp.
1212. *Tetracera.* Flowers often dicœcious or polygamous. Carpella 3-5, capsular, surrounded by the imbricated sepals. Seeds 1-2, shining, ovate, with an arillus.

Order 4. POLYGYNIA.  Styles many. Stamens many, hypogynous.

1213. *Nelumbium.* Cal. 4-5-leaved. Petals many. Fruit turbinate, in a truncate discus, with several 1-seeded hollows. Nuts ovate, crowned with the persistent style.
1214. *Dillenia.* Cal. 5-leaved. Petals 5. Capsules many-seeded, connate, replete with pulp.
1215. *Illicium.* Cal. 6-leaved. Petals 27. Caps. many, placed in a circle, 2-valved, 1-seeded.
1216. *Liriodendron.* Cal. 3-leaved. Petals 6. Samaræ imbricated in a cone. Caps. 1-2-seeded, not opening, attenuated.
1217. *Magnolia.* Cal. 5-leaved. Petals 6-9. Caps. 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous.
1218. *Michelia.* Cal. 3-leaved. Petals 15. Berries many, 4-seeded.
1219. *Uvaria.* Cal. 3-leaved. Petals 6. Berries numerous, pendulous, 4-seeded.
1220. *Annona.* Sepals 3, united at base, concave, cordate, acute. Petals 6, thick; the interior thicker or none. Anthers subsessile, with a dilated angular end. Berry pulpy, many-celled towards the outside.
1221. *Artabotrys.* Cal. 3-parted. Petals 6. Stamens hypogynous. Ovaries distinct, 2-seeded. Berries 2-seeded. Seeds collateral erect, without arillus.
1222. *Guatteria.* Sepals 3, united at base, ovate, subcordate, acute. Petals 6, ovate or obovate. Berries dry, coriaceous, ovate or subglobose, stalked, 1-seeded.
1223. *Asimina.* Cal. 3-parted. Petals 6, spreading, ovate-oblong; the inner smallest. Anthers subsessile. Berries usually 3, sessile. Seeds several.

History, Use, Propagation, Culture,

1162. *Capparis.* From its Arabic name *Kabar*, from which the Greeks made καππαρις. *Caprier*, Fr., *Capriolo*, Ital. and *Kapernstrauch*, Ger. This is a genus of low shrubs, some of which produce berries and others pods. C. spinosa has the habit of the common bramble; it grows in similar situations in the south of Europe, and especially on rocks and ruins. The chief supply of caper buds is from Sicily; but the plant is cultivated in the neighbourhood of Toulon in orchards, in the intervals between fig and olive trees, and in the neighbourhood of Paris, where it is trained on low walls, and the shoots during winter laid down and covered with soil to protect them from the frost. In this country it is generally treated as a stove plant; though it has stood the winter in the open air in some situations, and by raising from the seed for several generations might probably be naturalized. A plant stood near a century against the wall of the garden of Camden House, Kensington; it produced many flowers annually, though the young shoots were frequently killed to the stump during winter.

As a pickle, the flower buds of the caper are in great esteem throughout Europe. In Italy, the unripe fruit is prepared in the same way as the flower buds; both are highly acrid and burning to the taste. In the isles of the Mediterranean, and near Toulon, the flower buds of the caper are gathered just before they begin to expand, which forms a daily occupation during six months, when the plants are in a flowering state. As the buds are gathered they are thrown into a cask among as much salt and vinegar as is sufficient to cover

1224. *Xylopia.* Cal. 3-5-lobed. Petals 6; the exterior largest. Stamens usually inserted in a globose receptacle. Berries 2-15, on short stalks, compressed, frequently dry and opening. Seeds shining.
1225. *Hepatica.* Invol. 3-leaved, 1-flowered, resembling a calyx, entire. Sepals petaloid, 6-9, arranged in 2 or 3 rows. Ovaries many. Grains without an awn.
1226. *Anemone.* Invol. 3-leaved, distant from the flower, cut. Sepals 5-15, petaloid. Petals O.
1227. *Clematis.* Invol. O, or like a calyx under the flower. Sepals 4-8, colored. Petals O, or shorter than the sepals. Grains terminating in a feathery awn.
1228. *Naravelia.* Petals 6-12, longer than calyx. Grains seated on a thick hollow stalk.
1229. *Thalictrum.* Invol. O. Petals O. Grains dry, not awned, sometimes stalked, sometimes with a longitudinal furrow.
1230. *Adonis.* Sepals 5, appressed. Petals 5-15, with a naked claw. Grains many, 1-seeded, spiked, ovate, pointed with the persistent hardened style.
1231. *Knowltonia.* Sepals 5. Petals 5-15, with a naked claw. Ovaries upon a globose receptacle. Grains 1-seeded, berried, with a deciduous style.
1232. *Ficaria.* Sepals 3, deciduous. Petals 9, with a honey-pore at base. Grains obtuse.
1233. *Ranunculus.* Sepals 5, not deciduous. Petals 5, rarely 10, with a honey-scale at base. Grains pointed.
1234. *Trollius.* Sepals colored, 5-10-15, deciduous, petaloid. Capsules many, subcylindrical, many-seeded.
1235. *Isopyrum.* Sepals 5, deciduous. Petals 5, equal, tubular, 2-lipped. Ovaries 2-20. Capsules compressed, membranous, many-seeded. Seeds minute, dotted.
1236. *Eranthis.* Involucre under the flower, cut into many divisions. Sepals 5-8, colored, oblong, deciduous. Petals 6-8, tubular. Capsules stalked. Seeds globose.
1237. *Helleborus.* Sepals 5, persistent, roundish, obtuse, large, usually green. Petals 8-10, tubular, nectariferous. Stigmas orbicular. Capsules coriaceous.
1238. *Coptis.* Sepals 5-6, colored, petaloid, deciduous. Petals small, cucullate. Stamens 20-25. Caps. 6-10, on long stalks, membranous, 4-6-seeded.
1239. *Caltha.* Sepals 5, colored, round. Petals O. Stamens many. Capsule spreading, 1-celled, many-seeded.
1240. *Hydropeltis.* Sepals 3-4. Petals 3-4. Ovaries 6-18. Seeds in a pendulous ovate globose capsule.
1241. *Hydrastis.* Sepals 3, ovate. Petals O. Cariopsides berried, many in a head, terminated by the style, 1-celled, 1-2-seeded.

MONOGYNIA.

7638 Pedunc. 1-fl. solitary, Stipules spiny, Leaves roundish obtuse smooth, Caps. oval
7639 Pedunc. many-fl. Leaves obl. obt. emarginate downy beneath, Cor. campanulate
7640 Pedunc. umbelled, Leaves clustered in parcels
7641 Pedunc. 1-fl. solitary, Stipules spiny, Leaves roundish ovate acute smooth, Capsules oval

7648 Leaves ovate-oblong acuminate veiny

them, and as the supply of capers is increased more vinegar is added. When the caper season closes, the casks are emptied, and the buds sorted according to their size and color, the smallest and greenest being reckoned the best, and put into small casks of fresh vinegar for commerce. They will in this state keep fit for use for five or six years. It is said to be a common practice to put filings of copper in the first pickle to save vinegar, and give the buds a green color. The best capers are called nonpareilles, and the second best capucines. (*N. Cours complet d'Agr.*; art. *Caprier.*)

Most of the species are very shewy when in flower: C. cynophallophora has large petals, and stamens upwards of four inches long. Ripe cuttings of all the species grow readily in sand.

1163. *Marcgraavia.* In memory of George Marcgraaf, of Leibstadt, author of a voyage to Brazil in 1648. A sub-parasitical creeping shrub: at first it is radicant like some ferns, but as it advances, the stem becomes shrubby, adhering still by its fibres to the trunk of some tree, to the top of which it frequently runs, at length dividing into several subdivided loose pendulous branches, commonly terminated by flowering umbels. It is frequent in the cool wooded mountains of Jamaica, and, according to Browne, appears in such various forms, that it has been mistaken for different plants in the different stages of its growth. It grows freely in British stoves, and cuttings root in sand under a glass. The genus is remarkable for the transformation of part of the bracteæ into fistular bodies, resembling the pitchers of some other plants.

History, Use, Propagation, Culture,

1164. *Actæa.* Ακτη was the Greek name of the elder, which this plant resembles in foliage and fruit. Weed-like plants seldom seen in gardens. The berries of A. spicata are poisonous, and with alum yield a black dye. The tubers of A. racemosa are called snake root, and much used in North America by self-practitioners, and as an antidote against poison and the bite of the rattle snake.

1165. *Sanguinaria.* From *sanguis*, blood. All parts of the plant on being wounded discharge a blood-colored fluid. This is a singular and very delicate looking plant. It has a tuberous fleshy root with red fibres and a reddish juice: from each bud of the root there springs only a single fig-like glaucous leaf, with a one-flowered scape; the flower has no smell, and is very fugacious. It abounds in the woods of Canada, and in the back settlements, where the Indians stain themselves with its red juice.

1166. *Podophyllum.* From πους ποδος, a foot, and φυλλον, a leaf; in allusion to the long firm stalk on which the leaves are placed. Low neat herbaceous plants, with white flowers hidden by the overshadowing broad leaves.

1167. *Chelidonium.* From χελιδων, the swallow, because it was thought to flower with the arrival of that bird, and to perish with its departure. The English word celandine appears to be a corruption of chelidonium. The juice of C. majus is of an orange color and very acrimonious. It cures tetters and ringworms. Diluted with milk it consumes white opake spots on the eyes. It destroys warts, and cures the itch. There is no doubt but a medicine of such activity will one day be converted to more important purposes. (*Withering.*) The root, according to Loureiro, is extremely bitter, and greatly esteemed among the natives of Cochin-China, for a variety of uses in medicine.

1168. *Römeria.* Named after J. J. Römer, professor of botany at Landshut, and the collaborator of Schultz in an edition of the Species Plantarum of Willdenow. He died in 1820. A genus intermediate between Chelidonium, Glaucium, and Papaver.

1169. *Glaucium.* All the parts of the species appear covered with a *glaucous* bloom. Handsome sea-coast plants. G. luteum has large and numerous flowers, which, although of short duration, succeed one another in great abundance during most part of the summer, make a fine contrast with the sea-green dew-bespangled leaves, and are a great ornament to our sandy shores. The whole plant abounds in a yellow juice, is fœtid, and of a poisonous quality, and said to occasion madness.

1170. *Papaver.* Said by De Theis to have been so called from the Celtic *papa*, which signifies *pap*, or the soft food given to children, in which the seeds were formerly boiled to make the infants sleep. Opium is derived from οπος, juice; it is supposed to have been the Nepenthes of Homer. Rhœas, the name of one of the species, is from ῥεω, to flow or fall, in allusion to the quickly perishable nature of the flowers. The poppy produces a great quantity of seeds, for which reason Cybele, the mother of the gods, is represented crowned with poppy-heads as a symbol of fecundity.

The species of this genus are all shewy, with large, brilliant, but fugacious flowers. They are all easy of culture in almost any soil; and one species affords that singular medicine opium. P. Rhœas is one of the commonest weeds among corn on gravelly soils; but in its double and semidouble variegated varieties, it is also one of the handsomest of garden annuals. The capsules, as in P. somniferum, contain a milky juice of a narcotic quality: an extract from them has been successfully employed as a sedative; and some foreign practitioners are said to prefer this extract to opium.

P. somniferum, although it is found growing wild in the southern parts of Europe, and even in England, yet there is every reason for thinking that its seed must have been carried to these parts from Asia. It was very early cultivated in Greece, perhaps at first solely for the sake of its seed, which was used as food. It is extensively cultivated in most of the states of Europe in the present age, not only on account of the opium,

7649 Berries roundish, Petals length of stamens, Raceme ovate, Leaves 2-3 ternate
7650 Berries ovate-oblong, Petals shorter than stamens, Raceme ovate, Leaves bi-triternate

7651 The only species

7652 Stem erect 2-leaved 1-flowered, Fruit ovate

7653 Peduncles umbelled, Leaves pinnated with roundish toothed lobed segments, Petals elliptical entire
7654 Peduncles umbelled, Leaves pinnated with finely cut segments, Petals serrated or cut

7655 Pods 3-4-valved erect with rigid bristles at end

7656 Stem smooth, Cauline leaves repand, Pod warted roughish
7657 Stem smooth, Cauline leaves roundish sinuated, Pods rough, Flowers subsessile
7658 Stem hairy, Cauline leaves pinnatifid cut, Pod bristly

7659 Caps. subglobose torose hispid, Stem leafy many-flowered
7660 Caps. clavate hispid, Stem leafy many-flowered
7661 Caps. hispid, Scape 1-fl. naked hispid, Leaves bipinnate
7662 Caps. hispid, Scape 1-fl. naked hispid, Leaves simple pinnate sinuated

and Miscellaneous Particulars.

for which it is reared in Turkey, Persia, and India, but also on account of the capsules, and of the bland oil obtained from the seeds. All the parts of the poppy contain a white, opaque, narcotic juice; but it abounds more in the capsules: hence these are the only officinal parts of the plant, and for them chiefly is the plant cultivated in this country. They are gathered as they ripen; and as this happens at different times, there are annually three or four gatherings. They are brought to market in bags, each containing about 3000 capsules, and sold to the druggists. The London market is chiefly supplied from Mitcham in Surrey.

The milky juice of the poppy, in its more perfect state, which is the case in warm climates only, is extracted by incisions made in the capsules, and inspissated; and in this state forms the opium of commerce. The mode of obtaining it appears to have been nearly the same in the time of Dioscorides as is at this day adopted. The plants, during their growth, are carefully watered and manured, the watering being more profuse as the period of flowering approaches, and until the capsules are half grown, when it is discontinued, and the collection of the opium commences. At sunset, longitudinal incisions are made upon each half-ripe capsule, passing from below upwards, and not penetrating to the internal cavity. The night dews favor the exudation of the juice, which is collected in the morning by women and children, who scrape it from off the wounds with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by wooden spatules in the sunshine, until it attains a considerable degree of thickness. It is then formed by the hand into cakes, which are laid in earthen basins to be further exsiccated, when it is covered over with poppy or tobacco leaves. Such is the mode followed in India, and according to Kampfer's account, nearly the same is practised in Persia; and when the juice is drawn in a similar manner in this country and inspissated, it has all the characters of pure opium.

Opium is brought to this country in chests from Turkey and India. The Turkey opium is in flat pieces, covered with leaves. East Indian opium is in round masses, covered with the petals of the poppy in successive layers, to the thickness nearly of one-fourth of an inch. Mr. Kerr relates, that at Bahar, it is frequently adulterated with cow-dung, the extract of the poppy procured by boiling, and various other substances. In Malava it is mixed with oil of sesamum, which is often one half of the mass; ashes and the dried leaves of the plant are also used. It is also adulterated with the aquecus extract of the capsules, the extracts of Chelidonium glaucum, Lactuca virosa, and Glycyrrhiza glabra, and sometimes with gum arabic, tragacanth, aloes, and many other articles.

Poppy heads or capsules possess anodyne properties; they are chiefly employed, boiled in water, as fomentations to inflamed and ulcerated surfaces; and a syrup, prepared with the inspissated decoction, is used as an anodyne for children, and to allay the tickling cough in chronic catarrh and phthisis.

Opium operates as a powerful and very diffusible stimulus, but its primary operation is followed by narcotic and sedative effects in a degree much greater than could be expected from the previous excitement it induces. It acts directly on the nervous system, and when taken into the stomach destroys irritability, and allays pain in the most distant parts of the body, independent of the circulation, and without inducing any change on the composition of the blood. As the principle, therefore, on which opium acts is the same over all the body, the topical application of it is capable of producing similar effects, only in a diminished degree, to those resulting from it when it is taken into the stomach.

In moderate doses, opium increases the fulness, the force, and the frequency of the pulse, augments the heat of the body, quickens respiration, and invigorates both the corporeal and mental functions, exhilarating even to intoxication; but by degrees these effects are succeeded by langour, lassitude, and sleep; and in many instances headach, sickness, thirst, tremors, and other symptoms of debility such as follow the excessive use

History, Use, Propagation, Culture,

of ardent spirits, supervene. In very large doses the primary excitement is scarcely apparent, but the pulse seems to be at once diminished, drowsiness and stupor immediately come on, and are followed by delirium, sighing, deep and stertorous breathing, cold sweats, convulsions, apoplexy, and death. The appearances on dissection are those which indicate the previous existence of violent inflammation of the stomach and bowels; but notwithstanding the symptoms of apoplexy which an overdose, when it proves fatal, occasions, no particular appearance of an inflammatory state or fulness of the vessels of the brain are perceived.

The Turks call opium *afioni;* and in the *teriakihana*, or opium shops of Constantinople, they take it in graduated doses from ten grains to one hundred grains in a day. It is mixed with rich syrup and the inspissated juices of fruit, to render it more palatable and less intoxicating; and is taken with a spoon, or made up into small lozenges stamped with the words, Mash Allah, literally, "The work of God." The Tartar couriers, who travel great distances, and with astonishing rapidity, take nothing else to support them during their journeys. (*Dallaway's Constantinople*, quarto, 78.) There is, however, some reason for supposing that the Mash Allah, or Maslach of the Turks, contains other narcotics, as those of hemp and of lolium, as well as opium.

The use of opium for the purpose of exhilarating the spirits has long been known in Turkey, Syria, and China; and of late years it has been unfortunately adopted by many, particularly females, in this country. Russell says, that in Syria, when combined with spices and aromatics, he has known it taken to the amount of three drachms in twenty-four hours. Its habitual use cannot be too much reprobated. It impairs the digestive organs, consequently the vigour of the whole body, and destroys also gradually the mental energies. The effects of opium on those addicted to its use, says Russell, are at first obstinate costiveness, succeeded by diarrhœa and flatulence, with the loss of appetite and a sottish appearance. The memories of those who take it soon fail, they become prematurely old, and then sink into the grave, objects of scorn and pity. Mustapha Shatoor, an opium eater in Smyrna, took daily three drachms of crude opium. The visible effects at the time, were the sparkling of his eyes, and great exhilaration of spirits. He found the desire of increasing his dose growing upon him. He seemed twenty years older than he really was; his complexion was very sallow, his legs small, his gums eaten away, and the teeth laid bare to the sockets. He could not rise without first swallowing half a drachm of opium. (*Phil. Trans.* xix. 289.)

When opium has been taken in an overdose, the first thing to be done for counteracting its bad effect, is the exhibition of a powerful emetic; and for this purpose sulphate of zinc, or sulphate of copper dissolved in water, should be immediately swallowed, and the vomiting kept up for a considerable time, and urged by irritation of the fauces. Large draughts of vinegar and water, or other acidulated fluids, should afterwards be frequently taken; and the powers of the habit supported by brandy, coffee, and cordials. The sufferer should be kept awake, and, if possible, in continued gentle motion. Currie recommends the affusion of warm water at 106 degrees or 108 degrees for removing the drowsiness. (*London Dispensatory*, 426.)

Medical men have of late sought to discover the sedative principle of opium, and have found it in the extractive, from which a crystallized salt called morphia is obtained. Some foreign physicians, and Mr.

7682 Leaves reniform toothed downy beneath, Lobes round, Calyx 4-leaved
7683 Leaves peltate finely toothed, beneath downy without spots

and Miscellaneous Particulars.

Thomson, the author of The London Dispensatory, have found that a quarter of a grain of the acetate of morphia produces the most beneficial effects that can be expected from an anodyne, allaying pain, and procuring sleep without in any degree affecting the central functions. (*London Dispensatory*, 420.)

A variety of P. somniferum, known as the black poppy, from the color of its seeds, is cultivated for these to some extent; they are called maw seed, and generally stained of a light blue color.

P. Rhœas (*œillette*, Fr.) and also somniferum are cultivated in Flanders and Germany for their seeds, which are bruised for an oil used in cookery as a substitute for that of olives. In Poland and some parts of Russia, the seeds are used as a seasoning to soups, gruels, and porridge.

Professor Martyn, in his edition of Miller's Dictionary, has collected a body of facts, which clearly prove that opium may be produced to any extent in Britain, and of equal quality to that procured from abroad; the value of labor in this country, however, does not admit of such a thing. We have seen samples of opium made in the south of England quite equal to that of foreign growth, but we understood that the labor of collecting it was greater than could be afforded for its market price.

P. cambricum is admired for its yellow petals, and orientale and bracteatum are very splendid plants.

1171. *Meconopsis.* From *μηκων*, a poppy, and *οψις*, resemblance. A genus of herbaceous shade-loving plants, just intermediate between Papaver and Argemone. The flowers are yellow.

1172. *Argemone.* From *argema*, the name by which the cataract of the eye was known, and which was thought to be cured by this plant. A. mexicana is a troublesome weed in the West Indies, with a fig-like fruit, armed with prickles, and thence, by the Spaniards, called *Figo del inferno.* The whole plant abounds with a milky glutinous juice, which turns in the air to a fine bright yellow, and when reduced to consistence is not distinguishable from gamboge. In very small doses it s probably of equal efficacy, given in dropsies, jaundice, and cutaneous eruptions. It is esteemed very detersive, and generally used in diseases of the eyes: but the infusion is looked upon as a sudorific and resolutive, which may be used with success on many occasions. The seeds are said to be a much stronger narcotic than opium.

1173. *Sarracenia.* So named by Tournefort in honor of Dr. Sarrazin, a French physician of rank residing in Quebec, who sent this genus to him from Canada: it is called side-saddle flower from the resemblance of the stigma to a woman's pillion. These plants are remarkable for the singular form of the leaves, which are tubular and hold water, and some species have lids or covers, which it is alleged shrink and close over the mouth of the tribe in dry weather, so as to prevent the exhalation of the water. In great drought birds and and other animals resort to them. They grow in bogs in Carolina and Virginia, and in British gardens thrive very well in pots with turfy peat at the bottom, and the upper part filled with sphagnum, or water-moss, in which the plants must be set, and then placed in pans of water; they succeed best in frames in a shady situation. (*Bot. Cult.* 417.)

1174. *Nymphæa.* The *Nymph*, or Naiad of the streams. The species are beautiful aquatics, especially N. alba, which has a large flower filled with petals, so as almost to appear double: it raises itself out of the water and expands about seven o'clock in the morning, and closes again, reposing upon the surface, about

History, Use, Propagation, Culture,

four in the afternoon. The roots have an astringent bitter taste; they are used in Ireland, in the Highlands of Scotland, in the island of Jura, &c. to dye a dark brown or chesnut color. Swine are said to eat it, goats not to be fond of it, kine and horses to refuse it. The flowers, the herb, and the root were formerly used in medicine, but are all now obsolete.

N. lotus resembles our common white species very much in the form of the flower and leaves, but the latter are toothed about the edge. It is native of the hot parts of the East Indies, Africa, and America. It is very common in ponds, lakes, and rivers in Jamaica; and grows in vast quantities in the plains of Lower Egypt near Cairo, during the time they are under water. It flowers there about the middle of September, and ripens towards the end of October. The Arabians call it Nuphar. The ancient Egyptians made a bread of the seed of the Lotus dried and ground.

All the species grow well in large pots of water with a few inches of rich soil at the bottom: they are propagated by dividing the root, and some sorts which produce bulbs are increased by offsets from these. Mr. Kent, of Clapton, who cultivated exotic aquatics to great perfection, found that the bulbous rooted Nymphæas, if checked in their growth for want of water, from cold, or excessive heat, were apt to form bulbs at the roots and cease growing for the season. Hence the necessity of a regular and powerful moist heat to make them flower freely.

1175. *Limnocharis.* From λιμνος, a marsh, and χαιρις, dear, so called because the species are marsh plants. They have beautiful umbels of yellow flowers, and are very easily cultivated in a stove. They are increased by seeds.

1176. *Nuphar.* The Arabic name is *naûfar*, according to Forskahl. The species are shewy plants closely resembling Nymphæa. N. lutea is a native of most parts of Europe, and also of America. Linnæus states, that swine are fond both of the leaves and root; that goats are not fond of it; and that kine, sheep, and horses refuse it: also that crickets are driven out of houses by the smoke in burning it, and that both they and cock-roaches are destroyed by the roots rubbed or bruised with milk. Ray observes, that the flowers smell like brandy.

1177. *Euryale.* From ευρυαλος, broad, in allusion to the enormous broad floating leaves of the plant. A noble aquatic, easily cultivated in a good stove.

1178. *Bixa.* The American name of the tree. The drug called Terra Orellana, or Orleana, Roucon or Arnotto, is prepared from the red pulp which covers the seeds of this plant. By maceration in hot water, the seeds are separated from the pulp, the latter is then made into balls or cakes, which when dry are fit for use. Arnotto of a good quality is of the color of fire, bright within, soft to the touch, and dissolves entirely in water. It is reputed to be cooling and cordial, and is much used by the Spaniards in their chocolate and soups, both to heighten the flavor and to give them an agreeable color. It is esteemed good in bloody fluxes

7684 Leaves peltate at the edge and within the fissure sinuate toothed blistered smooth on each side [end

and Miscellaneous Particulars.

and disorders of the kidnies. Mixed with lemon-juice and a gum, it makes the crimson paint with which the Indians adorn their persons. It was formerly used by dyers to form the color called aurora; but at present it is not held in much estimation as a dye, though it still maintains its ground with painters. Arnotto is well known to be the drug which is used for dying cheese in Gloucestershire, under the name of cheese-coloring. It is used in Holland for coloring their butter. The bark makes good ropes for the common plantation uses in the West Indies; and pieces of the wood are used by the Indians to procure fire by friction.

1179. *Prockia.* A name of unknown meaning. American or Isle of France plants with alternate entire or toothed leaves, and yellow flowers, which are occasionally unisexual.

1180. *Sloanea.* Named by Plumier, in memory of the famous Sir Hans Sloane, Bart., physician to the king, and president to the Royal Society; author of the Natural History of Jamaica, and founder of Chelsea garden and hospital. The leaves are like those of the chesnut; the flowers very large, and the fruit as big as a tennis ball, armed all over with strong spines, and divided regularly into four cells, each containing one small chesnut. It grows freely in our stoves, and ripened cuttings root in sand under a hand-glass.

1181. *Apeiba.* The vernacular name of the plant in Guiana. Tibourbou and Petoumo are vernacular names among the Caribs. The species grow freely in light loamy soil. Cuttings must be well ripened, and the glass they are put under should have a little air given it occasionally, or they will damp off. The best way of flowering it, is to cut a ring round the bark of a large branch, which stagnates it and throws it into flower. (*Bot. Cult.* 20.)

1182. *Sparmannia.* In memory of Anders or Andrew Sparrman, a Swede, fellow of the Academy of Sciences at Stockholm, who travelled into China, the Cape of Good Hope, and the islands of the South Sea. His travels were published in London, 1785, quarto, and there are many descriptions by him in the Philosophical and other transactions. It is a beautiful shrub with snowy white petals, and singular nectaries. It grows freely in loam and peat, and cuttings root in sand under a hand-glass.

1183. *Entelea.* From εντελης, perfect. So named by Mr. Brown, because all its filaments are fertile; by which character, among others, it is distinguished from Sparmannia. A fine New Zealand plant, discovered originally by the botanists with Sir Joseph Banks in Cook's second voyage.

1184. *Muntingia.* Named by Plumier, after Abraham Munting, professor of botany at Groeningen, died in 1682. *Calabura* is an American name. The flowers resemble those of the bramble, and the fruit cherries. It grows in Jamaica on calcareous subalpine hills, flowering in spring; and in St. Domingo in the wet parts of woods, flowering in August and September. In our stoves it grows freely in light loam, and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture,

1185. *Grewia.* So named by Linnæus, in honor of Nehemiah Grew, M. D., F. R. S., famous for his work on the Anatomy of Vegetables. The species are shrubs with elm-looking leaves, generally deciduous, and of no great beauty. Cuttings root in sand under a hand-glass in heat. Some of the kinds produce a sort of berry which is esteemed by the natives of the country where they grow.

1186. *Tilia.* A name the meaning of which is unexplained. *Tilleul*, Fr., *Linden*, Ger., and *Tiglio*, Ital. The species are graceful trees with highly odoriferous flowers, all the soft parts abounding in mucilage.

T. intermedia is wild in Sweden, and will in some degree bear the smoke of London. It is a favorite avenue tree in Holland and Germany, and at Evelyn's suggestions (Sylva) was a good deal employed in this way in England. He describes some enormous lime trees in Switzerland, Germany, and Hungary, and speaks of its esteem in these countries, and by the Romans. "It is a shameful negligence," he says, "that we are no better provided of nurseries, for a tree so choice and universally acceptable:" for in his time they sent into Holland and Flanders, to our excessive cost, whilst our own woods spontaneously produce them, and though of somewhat a smaller leaf, yet altogether as good, apt to be civilized, and made more florid.

Lime-tree wood is turned into light bowls and dishes, and into boxes for the apothecaries. With the twigs they make baskets and cradles. Formerly the bark was used for writing tablets. Shoemakers make dressers of the plank to cut leather on. The truncheons make a far better coal for gunpowder than that of alder itself, and also scriblets for painters' first draughts. The wood is soft, light, and smooth, close grained, and not subject to the worm. The most elegant use to which it is applied is for carving. Many of Gibbon's beautiful works in lime-tree are dispersed about the kingdom in our churches and palaces; as in the choir of St. Paul's, the Duke of Devonshire's at Chatsworth, Trinity College Library at Cambridge, &c. Evelyn first recommended him to King Charles II. The sap inspissated affords a quantity of sugar. Boutcher remarks, that the timber is stronger and lighter than any sort of willow; and makes a proper lining for rooms, and when painted will last long.

In Lincolnshire, in the forest of Dean, and in various parts of the borders of South Wales they make ropes of the bark. This, by maceration, separates into thin rough layers, and is used for making the mats used by gardeners, and called in the north of Europe bast. They form a considerable part of the exports from Russia. This quality in the bark, and a great degree of viscidity in the whole tree, evince its acknowledged affinity to the mallow tribe.

7703 Leaves lanc. ovate soft, Cal. very hairy, Pedunc. 3-flowered
7704 Leaves cordate ovate oblong crenated scabrous, Pedic. axillary 3-flowered, Fruit of 4 pieces
7705 Leaves ovate obl. acum. smooth nearly entire, Fl. terminal panicled
7706 Leaves roundish ovate blunt toothed smooth, Peduncles solitary 1-flowered
7707 Leaves ovate crenate rough on each side, Peduncles axillary 3-flowered
7708 Leaves ovate crenate rough thickish, Pedunc. 2-6-fl. axill. and term. Fruit pilose

7720 Caps. 3-celled 3-valved 3-cornered, Angles bifid scabrous, Leaves obl. Lowest serratures setaceous
7721 Caps. obl. 3-celled 3-valved 6-furrowed 6-pointed, Leaves cordate, Lowest serratures setaceous
7722 Caps. prismatical cuneate acutangular 3-toothed, Lvs. ovate with about 1 seta at the base, Petioles hispid
7723 Caps. roundish depressed rugose, Lowest serratures of leaves setaceous
7724 Caps. roundish woolly, Leaves ovate obtuse downy equally serrated
7725 Caps. linear compressed 2-valved, Leaves lanceolate equally serrate

7726 Leaves 3 feet long obovate, Flowers growing out of the stem and old branches

7727 Leaves oval
7728 Leaves ovate obtuse

7729 Leaves very blunt striated, Peduncles short, Berries 4-seeded

and Miscellaneous Particulars.

The honey made from the flowers of the lime tree is reckoned the finest in the world. Near Kowno in Lithuania, there are large forests chiefly of this tree, and probably a distinct variety or species. The honey produced in these forests sells at more than double the price of any other, and is used exclusively in medicine and for mixing with liqueurs. (*Encyc. of Agric.; Poland and Hungary.*)

1187. *Corchorus.* Κορχορος, the Greek name of a culinary vegetable, supposed to be the same as that now known as C. olitorius. C. olitorius is sown in great plenty about Aleppo as a pot herb, the Jews boiling the leaves to eat with their meat, whence in French it is called *Mauve-de-Juif.* The other species are weeds.

1188. *Grias.* From γεαω, to eat. The fruit is eaten in the West Indies under the name of the Anchovy pear. The uprightness of the growth and the largeness of the leaves give this tree a very elegant appearance. The fruit is about the size of an alligator's egg, and much like it in shape, only a little more acute at one end, and of a brown russet color. It is frequent in many parts of Jamaica, and grows generally in low moist bottoms or shallow water, where the fruit is pickled and eaten in the same manner with the East Indian mango, which it exactly resembles in taste. It grows in a loamy soil, and large cuttings, Sweet observes, succeed best in the same soil under a hand-glass in heat.

1189. *Calophyllum.* From καλος, beautiful, and φυλλον, a leaf, on account of its large beautifully veined leaves. C. Inophyllum (ις ινος, fibre, because the middle nerve of the leaf seems to ramify into a multitude of fibres) is a very large tree, with leaves like a water lilly, snow-white fragrant flowers, and fruit like a walnut. The trunk when wounded exudes a viscid yellowish juice, frequently hardening to a gum. It is common in Malabar, in sandy soils, and bears fruit twice a year, in March and September, frequently to the age of three hundred years. An oil is expressed from the nuts to burn in lamps, to assuage pains, and to make ointments. The bark and gum is also used for medical purposes. In Java, &c. they plant this tree about their houses, for the elegance of the shade and the sweetness of the flowers.

C. Calaba (the name among the Caribs) branches from the ground upwards, and is therefore well adapted for tree hedges. It has a green fruit not unlike our cornelian cherry, which is eaten by the natives, and an oil is expressed from it for lamps. Both species grow freely in a light loamy soil, and ripe cuttings are readily struck in sand under a glass and plunged in heat. (*Sweet.*)

1190. *Mammea.* An alteration of its American name, *Mamey.* The name having some resemblance to the Latin word *mamma*, a teat, Linnæus attributed the derivation to that word, on account of the large fleshy pointed nature of its fruit. *Abricot-sauvage*, Fr. A handsome tree with a spreading elegant head, like those

History, Use, Propagation, Culture,

of Magnolia grandiflora, and odoriferous white flowers on peduncles. The fruit is roundish, with a leathery rind, inclosing one thinner, containing a firm bright yellow pulp, having a pleasant singular taste, and a sweet aromatic smell; but the skin and seeds are very bitter and resinous. It is eaten raw alone, or cut in slices with wine or sugar, or preserved in sugar. In Martinico they distil the flowers with spirit, and make a liquor which they call Eau créole.

Some horticulturists are now attempting its culture in our stoves as a fruit tree. It grows freely in sandy loam, and ripened cuttings, with the leaves not shortened, root in sand under a hand-glass in heat. (*Sweet.*)

1191. *Ochna.* The Greek name of the wild pear tree, to which the genus so distinguished by Linnæus has no kind of resemblance. The species are pretty free-flowering plants, with shining serrated leaves, and long racemes of beautiful yellow flowers. They grow freely in loam and peat, and cuttings root readily in sand under a hand-glass.

1192. *Elæocarpus.* From ελαια, the olive, and καρπος, fruit, in allusion to the shape of its fruit. The stones cleaned from the pulp, and set in gold, are formed into necklaces. The species thrive in loam and peat, and cuttings root in sand under a hand-glass.

1193. *Alangium.* So denominated by Lamarck, from a slight alteration of one of its Malabar names, *Alangi.* It grows in light sandy soil, and cuttings root in sand under a hand-glass in moist heat. (*Sweet.*)

1194. *Mentzelia.* Named after Christian Mentzel, a Prussian, physician to the Elector of Brandenburg; he died in 1701. Curious plants related to Loasa.

1195. *Lagerstrœmia.* So named by Linnæus from Magnus Lagerstroem, of Gottenburgh, director of the Swedish East India Company, who procured many curiosities from China, and gave them to the public. L. reginæ is a very handsome shrub: the flowers are in panicles, a span long, pale rose-colored in the morning, growing deeper through the day, and becoming purple in the evening. According to Sweet, this species is rather difficult to preserve through the winter; it requires a good heat, and but little water in winter; if it happens to have too much wet, it is a great chance if it survives: in summer it grows very fast, and requires plenty of room and water. Cuttings of both kinds root readily in sand, under a hand-glass. (*Bot. Cult.* 73.)

1196. *Ægle.* Αιγλη was one of the Hesperides. Correa de Serra named the genus *Ægle* from the fruit having some resemblance to the orange. Sweet observes, that this plant likes a rich loamy soil. The wood

7730 Stigma capitate, Petals 8-10, Leaves obovate very blunt serrated
7731 Flowers solitary, Leaves ovate acutely toothed, Sepals ovate

7732 Leaves lanceolate ellipt. serrated, Racemes axillary
7733 Leaves obl. lanc. serrated netted, Racemes axillary clustered, Drupes blue

7734 Petals 10, Branches spiny

7735 Stem branched, Peduncles axillary, Petals crenate obtuse
7736 Stem branched, Peduncles axillary solitary, Petals acuminate, Fruit reflexed

7737 Petals crisp, Panicle terminal, Leaves roundish ovate acute smooth
7738 Petals wavy, Panicle terminal, Leaves oblong smooth

7739 Middle leaflet stalked, Fruit with 12 cells

7740 Leaves subsessile connate at base lin. lanc. smooth above downy beneath, Caps. 10-celled

7741 Leaves lin. lanc. sessile 3-nerved villous on each side, Pedunc. cymose 1-sided
7742 Leaves on short stalks ovate lanceolate acum. wavy at edge: the upper hairy, Cymes hirsute
7743 Lvs. sessile obl. obt. hirsute, Pedunc. short 1-fl. or cymose, Caps. small in a large hairy pyramidal calyx
7744 Leaves roundish ovate rugose tomentose hairy stalked, Pedunc. 1-fl. 1-3 together, Calyx villous
7745 Leaves stalked cordate acuminate smooth, Fl. cymose, Pedunc. with long bractes
7746 Leaves stalked cordate ovate acuminate fringed at edge rugose and a little glutinous on each side
7747 Leaves sessile linear oblong acute wavy at edge 3-nerved at base, Sepals villous with long points
7748 Lvs. lanc. acute 3-nerv. hairy reticul. beneath stalked, Stalks sheathing the stem with their connate bases
7749 Leaves sessile linear lanceolate waved crisp 3-nerved rugose pubescent, Fl. sessile umbelled
7750 Leaves stalked ovate blunt rugose downy beneath, Pedunc. long hoary 1-flowered
7751 Leaves stalked ovate lanc. 3-nerved smooth above downy beneath, Petioles dilated and united at base
7752 Lvs. ovate lanc. on short stalks sheathing at base revolute at edge, Pedunc. hirsute leafy 1-flowered
7753 Leaves spatulate toment. rugose 3-nerved sessile subconnate: the upper narrower, Pedunc. 1-flowered
7754 Leaves obl. lanc. acuminate at each end rugose, Stalks short hairy sheathing, Pedunc. short 1-2-3
7755 Leaves spatulate ovate downy hairy narrowed into a short stalk wavy at edge, Pedunc. short 1-flowered
7756 Leaves sessile obl. ellipt. hoary downy about 3-nerved, Fl. 3-8 in terminal umbels, Outer sepals largest
7757 Lvs. conn. obl. lanc. nerv. above smooth and shin. beneath silky, Fl. in corymb. cymes, Ped. and cal. vill.

and Miscellaneous Particulars.

requires to be ripened before the cuttings are taken off; then to be planted in a pot of sand without shortening the leaves, and to be plunged under a hand-glass in heat.

1197. *Cistus.* Κιστος, in Greek; derived from κιστη, a box, or capsule. The capsules of the genus are remarkable. All these words have been formed from the Anglo Saxon, *cyst*, which signifies a hollow vessel.

The species are for the most part shewy and free-flowering plants; the colors brilliant, and the petals very fugacious. In gardens they are rather difficult to keep in a neat shape, getting naked below, and often dying wholly or in part during severe winters. They succeed best in glass cases, which can be entirely removed in summer, or in a dry soil under a warm wall.

C. villosus has a strong woody stem, the flowers are produced at the ends of the branches, four or five together, almost in form of an umbel, but it rarely happens that more than one is open at the same time. The petals are large, purple, and spread open like a rose; they are but of short duration, generally falling off the same day they expand; but there is a succession of fresh flowers every day for a considerable time in May and June; generally again in September and October, if the autumn be favorable, and even in the winter if the plants be protected from frosts.

C. ledon and ladaniferus produce the gum ladanum, but not in such quantities as C. creticus. The resin, which is secreted from the leaves and other parts of the shrub, is scraped off by means of a kind of rake, to which numerous leathern thongs are appended instead of teeth. This instrument being drawn backwards and forwards over the plant from time to time, collects the resin. The chief use of this gum in modern practice is in fumigations, its fragrant smell having made it a constant ingredient in such preparations. C. ladaniferus is the most popular species for warm situations in ornamental scenery.

"Most of the species," Sweet observes, "will survive through the winter in the open air, if the weather be not too severe; but it is safest to keep some of all the kinds in pots, that they may be sheltered from severe frosts; and they can be turned out in the borders in spring, when they will thrive and flower well. They will succeed in any common soil, or a mixture of loam and peat will suit them very well. They may be increased by layers; or young cuttings, as soon as ripened, taken off at a joint, and planted under a hand-glass, will root readily: they may be also raised from seeds, which are produced in abundance." (*Bot. Cult.* 168.)

History, Use, Propagation, Culture,

1198. *Helianthemum.* From ἥλιος, the sun, and ἄνθος, flower, in allusion to the bright golden radiance of the blossoms. This is a shewy free-flowering genus of little trailing plants, mostly ligneous, and well adapted for rock-work. A number of them answer best kept in pots, and sheltered by frames during winter; but some are quite hardy, and none are more ornamental than the H. vulgare, and its varieties with orange, yellow, straw-colored, red, and double flowers. It is one of the handsomest plants in cultivation for rock-work. All the species are of easy culture in light soil, and cuttings root freely under a hand-glass.

1199. *Baucra.* Named after Francis and Ferdinand Bauer, German botanical draughtsmen of the highest

7758 Stem nearly smooth, Lvs. sess. lin. revol. at edge brownish green above hoary beneath, Fl. sol. Sep. shining
7759 Young shoots visc. with downy hairs, Lvs. sess. lin. obl. viscid downy beneath, Fl. in term. umb. Sep. villous
7760 Branches hairy rough hoary, Lvs. sess. atten. at base green above ash-colored beneath, Ped. shorter than
7761 Leaves sessile hoary ovate-lanc. Pedunc. panic. hairy, Sepals 3 acute hairy [leaves, Cal. hairy
7762 Branches villous, Leaves obov. lanc. hoary, Pedunc. and cal. villous, Sepals 3
7763 Branches white with scales, Leaves broad ovate blunt wavy at base silvery on each side, Cal. hairy
7764 Branches white with scales upwards, Lvs. stalked ovate-obl. Pedunc. long brached panicl. Sepals 5 scaly
7765 Branches hairy, Lvs. obl. lanc. acute hairy pale beneath, Pedunc. hairy 1-fl. Capsule shorter than calyx
7766 Stems nearly simple, Radical leaves stalked ov. obl. 3-nerved hairy, Ped. panic. few, Cal. smooth shining
7767 Stem hairy, Leaves sess. obl. lin. 3-nerved villous, Racemes lax without bractes, Ped. filiform naked
7768 Stem nearly smooth, Lvs. obl. ellipt. toothl. Fl. opp. with stipules, Ped. erect smooth shorter than calyx
7769 Lvs. on short stalks lin. obl. narr. rev. at edge, Stip. lin. subulate, Pedunc. filif. pubescent, Calyx inflated
7770 Branches hairy, Leaves obov. obl. acute toothletted, Stip. lin. obl. Pedunc. and cal. hairy
7771 Leaves obl. 3-5-nerved rough with short stellate hairs, Racemes long pubescent cinereous few-flowered
7772 Branches hoary, Leaves stalked opp. and alternate blunt glauc. Stipules subulate, Raceme term. erect
7773 Stem tortuose, Leaves altern. lin. rough at edge subinvolute, Pedunc. sol. 1-fl. Caps naked
7774 Leaves setaceous glaucous nearly smooth, Stip. filiform long, Pedunc. racemose, Calyx hairy
7775 Branches villous, Leaves lin. obl. pubesc. Stip. lin. subul. mucron. erect, Pedunc. racemose glutinous
7776 Branches villous glutinous, Leaves lin. vill. glut. ash-colored, Stipules long lax, Pedunc. and cal. villous
7777 Leaves stalked ovate hairy on each side, Racemes short term. Pet. scarcely larger than calyx
7778 Leaves lanc. ellipt. blunt green on each side, Racemes simple few-fl. Cal. subglobose ovate
7779 Branches simple long, Leaves pilose hispid: lower ovate; upper lanc. Racemes simple hairy hoary
7780 Leaves oblong hairy green above hoary beneath, Racemes simple, Pedic. and cal. hoary
7781 Leaves without stipules stalked ovate cordate, Racemes simple solitary few-flowered terminal
7782 Branches silvery with scales, Leaves stalked obl. blunt silvery with small stipules, Cal. scaly
7783 Branches ascend. hoary. Leaves downy glaucous: the lower round; upper ellipt. Stip. and bractes green
7784 Leaves lanc. ovate hoary beneath green above, Calyx furrowed with elevated hairy nerves
7785 Leaves obl. ellipt. hoary beneath deep green shining above, Calyx hoary: its nerves with a few hairs
7786 Leaves scarcely revol. at edge hoary beneath, green and hairy above: lower round; upper obl. Rac. lax

7787 Lower leaves round: upper obl. lin. hairy green beneath, Racemes and calyxes hairy
7788 Leaves obov. obl. somewhat hairy, Racemes few-fl. term. Pet. narrow lanceolate
7789 Leaves ovate-obl. keeled sessile, Peduncles long branched panicled, Stipules O
7790 Stipules O, Leaves lanc. hoary hairy beneath, Pedunc. long 2-leaved and racemose, Calyxes hairy
7791 Leaves opp lanc. 3-nerved hairy viscid, Radical obovate, Racemes without bractes, Petals serrated
7792 Leaves obovate obl. revolute at edge downy hairy hoary beneath, Calxes very hirsute white
7793 Leaves obl. linear glaucous above hoary beneath, Cal. hoary minutely pubescent, Branches hoary
7794 Leaves lin. obl. revolute at edge hoary on each side, Calyxes very hirsute white
7795 Leaves lin. very short pubescent opp. Stip. mucronate erect, Pedunc. villous few-flowered
7796 Leaves oblong lin. revolute at edge the younger hoary on each side, Calyxes glaucous, Sepals ciliated
7797 Leaves short stalked lin. oblong hispid above, Racemes lax, Calyx with deciduous hairs
7798 Leaves flat ovate obl. acute smooth above beneath finely downy, Cal. striated smoothish
7799 Leaves obl. ovate obt. flat beneath hoary above smooth green, Cal. striated smooth shining
7800 Leaves stalked obl. lin. downy beneath glaucous above, Cal. shortly hairy striated glaucous obtuse
7801 Leaves linear hoary on each side setose at end, Stipules subulate, Cal. hairy nerved striated
7802 Upper leaves flat obl. hairy, Stipules ciliated longer than stalk, Fl. large, Calyxes hairy
7803 Leaves ovate lanc. a little downy on each side, Stipules linear, Ped. and cal. pilose hirsute
7804 Leaves downy hoary beneath glaucous above revolute at edge, Calyxes yellowish glaucous
7805 Leaves narrow lanc. flat with stellate pubescence on each side, Raceme terminal few-flowered

DIGYNIA.

7806 The only species

7807 Leaves cuneate obovate upwards crenate toothed
7808 Leaves ovate-oblong cordate at base, upwards crenate toothed
7809 Leaves ovate acute nearly entire
7810 Leaves oblong acute crenate-toothed upwards, green beneath

and Miscellaneous Particulars.

celebrity. Nothing comparable to their works has ever appeared from any other hand. The species is a hardy free-flowering plant, of easy culture in sandy loam and peat, and cuttings root in the same soil under a glass.

1200. *Fothergilla.* In memory of John Fothergill, M. D., an eminent physician and patron of botany, who cultivated a variety of the most curious plants in his garden near London. The species are dwarf deciduous shrubs, of easy culture in light soil or peat, and generally increased by layers.

History, Use, Propagation, Culture,

1201. *Curatella.* From *curatus*, worked; a name given by Aublet to the genus, because the leaves, which have a rough surface, are used in Guyana for polishing bows, sabres, and other weapons. A small tree with rough leaves, which grows well in sandy loam; cuttings root in sand under a glass.

1202. *Pæonia.* The physician Pæon was the first to use this in medicine. The Greek legend adds, that he used it to cure Pluto of a wound inflicted by Hercules. The species are magnificent flowering plants, especially P. officinalis and moutan, with their numerous varieties. P. moutan and its different varieties are hardy enough to bear our winters in the open air; but they do not flower in such perfection as when planted out in a conservatory, or in a pit where they may be protected from the severe frost under glass: they will thrive well in any rich light soil; and ripened cuttings, slipped off, and planted in the ground, in a shady place, without cover, will root freely. (*Bot. Cult.* 234.)

P. edulis has a more slender stem than the common Pæony. The Daurians and Mongols boil the root in

7811 Leaves ovate subrepand toothletted rough

7812 Segments of leaves ovate obl. glaucous beneath

7813 Capsules smooth recurved, Segm. of leaves smooth shining 3-parted with ovate lanceolate lobes

7836 Stem erect much branch. Lvs. smooth rigid : low. multifid, Branc. and bractes lin. ent. Rac. lax. Pet. stalk.

7837 Leaves palmate many-parted, Lobes linear distant, Pedicels longer than bract, Pet. shorter than calyx

and Miscellaneous Particulars.

their broth, and grind the seeds and put them into their tea. P. officinalis was by old authors said to be of two sorts, male and female, the flowers of the former being smaller and lighter colored than those of the latter. These distinctions, however, were not indicative of sexual difference, the pæony being hermaphrodite, but merely of stronger and weaker growing varieties, according to the practice of the age. Now they are laid aside, the varieties reduced to seven or eight, of which a full account is given in the Horticultural Transactions (vol. ii. 273.). Of these, the double red, the most common, when introduced at Antwerp about the end of the sixteenth century, sold for twelve crowns a root. A useful account of the species and varieties has been published by Messrs. Anderson and Sabine, in the transactions of the Linnean Society.

1203. *Hibbertia.* Named after George Hibbert, Esq. who was once a distinguished English collector of plants. Twining or trailing plants of New Holland, with bright yellow flowers.

1204. *Delphinium.* From δελφιν, a dolphin, on account of the resemblance between the nectary of the

History, Use, Propagation, Culture,

plant and the imaginary figures of the dolphin. The species are shewy annuals or perennials, valuable as border flowers. The leaves are generally much divided, and the flowers in terminal spikes, blue, purple, or red; never yellow or any shade of that color.

D. consolida, (from *consolidare*, to unite; it being formerly reputed as a most powerful vulnerary,) *Pied d'Allouette*, Fr., *Rittersporn*, Ger., is a shewy annual, with blue, pink, purple, and white flowers, and semi-double and double. D. Ajacis, so called because some traces may be perceived in the flower of what may be likened to the letters AIA, is by some considered as only a variety of this species: both are universally grown as border annuals. D. elatum is well adapted for shrubberies. All the species are of the easiest culture. The species are extremely difficult to distinguish from each other, and are probably in many cases mere varieties.

1205. *Aconitum.* So called from growing about Acona, a town of Bithynia. The species are robust free-flowering plants of some beauty and consequence. The stems rise from two to six feet in height, upright, strong, furnished with many digitate or palmate leaves, and terminated by panicles or loose spikes of blue or yellow flowers.

A. Napellus, from *napus*, a turnip, its grumous roots resembling little turnips, is a well known poisonous plant. Linnæus says, that it is fatal to kine and goats, especially when they come fresh to it, and are not acquainted with the plant; but that it does no injury to horses, who eat it only when dry. He also relates (from the Stockholm Acts) that an ignorant surgeon prescribed the leaves, and on the patient refusing to take them, he took them himself and died. The ancients, who were acquainted with chemical poisons, regarded the Aconite as the most violent of all poisons. Some persons, only by taking in the effluvia of the herb in full flower by the nostrils, have been seized with swooning fits, and have lost their sight for two or three days.

7838 Stem erect branch. Lvs. 5-part. Lobes obl. acumin. Pet. shorter than cal. Caps. netted with color pubescent

7842 Petioles sheathing at base, Lvs. many-part. with lin. lobes, Raceme close, Spur straight longer than flower

7843 Lvs. somewhat dilated at base, Segm. cuneiform serr. cut in front, Stem upwards and peduncles pubescent
7844 Petioles not dilated at base, Lvs. flat trifid beyond the middle, Lobes cuneiform trifid at the end acuminate
7845 Pet. scar. dilat. at base, Lvs. 3-5-part. multif. with lin. lobes, Rac. straight, Pet. beard. at end : low. very vill.
7846 Pet. scar. dilat. at base, Lvs. 3-7-lob. Lobes obl. ac. cut pinnatifid : up. 3-part. Caps. nett. at keel and edge cil.
7847 Pet. smth. but scar. sheath. at base, Lvs. 5-par. Lobes 3-5-fid lin. Pet. sh. than cal. Caps. refl. from their base
7848 Petioles not dilated at base, Leaves concave beyond the middle trifid, Lobes cuneiform cut acuminate at end
7849 Petio. not dilat. at base, Lvs. 5-lob. with cut lobes, Stem flexu. and petioles hairy, Bractes lin. Caps. smooth
7850 Petioles sheathing at base, Lvs. many-par. with lin. subul. segm. Fl. pubesc. Spur acute longer than flowers
7851 Pet. not dilat. at base, Lvs. 3-7-lob. with obl. ac. cut pinnat. lobes, Rac. lax branch. Bractes and ovaries pub.
7852 Petioles sheathing at base, Lvs. many-parted in lin. lobes, Rac. long, Spur straight blunt longer than pedicel
7853 Spur very short, Bracteoles inserted at base of pedicel, Petioles hairy, Pedicels twice as long as flower
7854 Spur scarcely shorter than cal. Bracteoles inserted at base of pedicel, Petioles pubesc. Pedic. scarcely longer
7855 Spur nearly as long as calyx, Bractes inserted in the middle of pedicel, Petioles hairy [than flower

7856 Pan. divaricating, Branches tortuose, Helmet conical half circular, Spur short thick spiral [at end
7857 Fl. spiked or panic. numerous, Lvs. deeply 3-5-lobed with cuneate trifid lobes, Spur slender straight curv.
7858 Helmet conical cylindric. Spur slender spirally twisted, Lip divaricating, Lvs. palm. 3-5-lob. beyond middle
7859 Veiny smooth, Pan. smoothish with ascend. branches, Bag of hoods very large ventric. Spur thick subinvol.
7860 Pan. divaricating very smooth, Branches tortuose, Spur thick somewhat spiral, Lobes of leaves rhomboid
7861 Fls. panic. Sep. and pet. persist. Bag of hoods scarcely any, Spur thick spiral, Lvs. multif. with lin. ac. segm.
7862 All over densely pubesc. Lvs. very large palmate 3-5-lobed beyond middle pubesc. Helmet conical cylindr.
7863 Like Anthera, but flowers smoothish variegated with a low subconical helmet [compressed
7864 Like Lycoctonum, but flowers panicled, Stem peduncles and flowers villous, Ovaries smooth or hairy
7865 Ovaries 4-5, Helmet conical with a long claw, Rac. lax simple, Lvs. 3-5-parted with trifid toothed lobes
7866 Pan. lax, Helmet conical elongated abruptly mucronate in front, Spur thick spiral, Ovaries 3-5

7867 Pan. lax, Branches 1-4-fl. Spur thick long abruptly kneed, Bags of hoods inflated, Ovaries 3-5 smooth
7868 Ovaries 3 smooth, Raceme lax corymbose, Ped. smooth, Helmet very convex subconical
7869 Pan. lax, Helmet exactly conical, Spur very thick blunt very short, Bag of the hoods very large
7870 Fl. panic. Helmet conical, Spur thick blunt very short. Lvs. deeply lobed with narrow diverging segments
7871 Stem very short, Low. lvs. few on long stalks 5-part. with palm. segm. Hoods hook. blunt, Ovaries 3 villous
7872 Ovaries 3 smooth, Raceme cylindric. long, Leaves divided down to petiole with linear acute furrowed lobes
7873 Ovaries 3 smooth, Rac. cylindr. long very compact, Pedicels smooth shorter than bractes, Lvs. subpedate
7874 Stem twining with spreading hairs, Petioles ciliated, Leaves 3-5-parted with pinnatifid lobes, Ovaries 5-7
7875 Pan. lax, Branches diverging, Helmet exactly conical, Leaves 3-lobed with entire lobes, Ovaries villous

PENTAGYNIA.

7876 Leaves very rough toothed

and Miscellaneous Particulars.

But the root is unquestionably the most powerful part of the plant. Matthiolus relates, that a criminal was put to death by taking one dram of it. Dodonæus gives us an instance, recent in his time, of five persons at Antwerp, who ate the root by mistake, and all died. Dr. Turner also mentions, that some Frenchmen at the same place, eating the shoots of this plant for those of masterwort, all died in the course of two days, except two players, who quickly evacuated all that they had taken by vomit. We have an account, in the Philosophical Transactions, of a man who was poisoned, in the year 1732, by eating some of this plant in a salad, instead of celery. Dr. Willis also, in his work De Anima Brutorum, gives an instance of a man who died in a few hours, by eating the tender leaves of this plant also in a salad. He was seized with all the symptoms of mania. The Aconite, thus invested with terrors, has, however, been so far subdued, as to become a powerful remedy in some of the most troublesome disorders incident to the human frame. Baron Stoerck led the way by administering it in violent pains of the side and joints, in glandulous scirrhi, tumours, ulcerous tubercles of the breast, &c. to the quantity of from ten to thirty grains in a dose, of an extract, the method of making which he describes.

Willdenow and the Dublin College consider that the plant used by Stoerck was the A. neomontanum, in which opinion Mr. Thomson agrees in his London Dispensatory.

All the species are poisonous in a high degree. The limits of the species are extremely obscure, and in a very unsettled state; Decandolle in his Systema, increased the number at that time known, but in his Prodromus many of the species of the Systema are considered mere varieties. Dr. Reichenbach has, however, multiplied the species prodigiously, but with little reason.

1206. *Trachytella.* From τραχυτης, roughness. These are climbing shrubs with racemose white flowers, and hard rough leaves, which are used in China for polishing metals and hard wood.

History, Use, Propagation, Culture,

1207. *Cimicifuga.* From *cimex*, a bug, and *fugo*, to drive away, indicating certain virtues a species is supposed to possess. The C. serpentaria is used with success by the native practitioners in North America, for curing the dangerous bite of the rattlesnake. Tall, leafy herbaceous plants, with the appearance of Actæa.

1208. *Aquilegia.* From *aquila*, an eagle; the inverted spurs of the flower have been likened to the talons of a bird of prey. The species are smooth-leaved, handsome-flowered plants. A. vulgaris is an old inhabitant of the flower border: the whole plant has been recommended to be used medicinally, but it belongs to a suspicious natural order, and Linnæus affirms, that children have lost their lives by it. A. alpina is the handsomest species.

1209. *Nigella.* From *niger*, black, because of the color of the seeds, which are the part of the plant known in cookery. The species are curious or neat little plants, with fine cut leaves like fennel. N. damascena and sativa are sown as hardy annual flowers; and on the continent, the leaves and seeds of the latter species and N. arvensis, are used in cookery instead of more expensive aromatics. They are also said to be extensively used in the adulteration of pepper.

1210. *Reaumuria.* So named by Hasselquist, in honor of René A. F. de Reaumur, author of several entomological works; Histoire des Insectes, &c. He died in 1757. A small cæsious plant, bearing an abundance of bright lilac flowers.

1211. *Colbertia.* Named by Mr. Salisbury after the famous Colbert, a patron of the Paris garden, who destroyed with his own hands the vines which had been planted therein in lieu of more curious objects. A fine plant, with leaves like those of Dillenia speciosa.

1212. *Tetracera.* From τετρα, four, and κερας, a horn, because of its four capsules recurved like as many horns. Shrubs or small trees, which are often climbers with alternate stalked naked leaves, often rough above. The flowers are panicled or racemose. The leaves are remarkable as an exemplification of that mode of nervation which M. Decandolle calls feather-nerving.

1213. *Nelumbium.* This is called in Ceylon *Nelumbo.* Sir James Smith proposed to call the genus by the more classical name of *Cyamus*, but it has been remarked, that it remains to be proved that the holy κυαμος, was this plant. N. speciosum is a native both of the East and West Indies, China, Cochin-China, and Japan,

7877 Monogynous, Racemes very long, Caps. dry dehiscent, Leaves biternate with serrate or cut segments

7878 Ovaries 4 subsessile very vill. Racemes panicled, Lvs. ternate or biternate, Segm. ovate-lanc. cut toothed
7879 Ovaries 2-3 smooth sessile, Racemes panicled, Leaves biternate, Segments cordate at base
7880 Ovaries 12-15 in a roundish head, Racemes dichotomous panicled, Leaves palmate

7881 Spurs incurved, Caps. vill. Stem few or 1-fl. Lvs. covered with viscid down, Styles not longer than stamens
7882 Spurs incurved, Caps. villous, Stem leafy many-fl. Leaves nearly smooth, Styles not longer than stamens

7883 Spurs incurved twice as short as petals, Upper part of the plant and capsules covered with glandular hairs
7884 Spurs straight longer than limb, Stam. as long as petals, Styles long, Petals oval obl. shorter than petals
7885 Spurs straight longer than very blunt limb, Styles scarcely longer than stamens and petals, Sepals acute the length of petals
7886 Spurs straight somewhat incurved at end twice as short as limb of petals, Stem 2-3-fl. leafy, Lvs. finely cut
7887 Spurs straight, Styles and stamens exserted, Sepals acute a little longer than petals, Segm. of leaves 3-parted
7888 Spurs straight as long as limb, Styles and stamens as long as sepals, Sepals the length of petals

7889 Anthers blunt, Caps. 5 smooth 2-cell. united as far as end into an ovate globose one, Fls. in a leafy involucre
7890 Anthers blunt, Flowers in an involucre, Sepals erect conniving
7891 Anthers blunt, Caps. muricate, Stem erect hairy, Flowers naked
7892 Anthers pointed, Styles 5-7 revolute, Capsules and stem smooth, Branches diverging
7893 Anthers pointed, Styles 8-10 erect, Caps. smooth 1-nerved at back, Stem erect smooth, Branches erect
7894 Caps. 5-10 smooth erect, Styles straight

7895 A low shrub, with narrow glaucous leaves

7896 Leaves smooth 10-nerved 1-1½ foot long 6 inches broad

7897 Lvs. oval-obl. blunt or nearly acute smooth roughish above somewhat toothed at end, Pedunc. panicled [pubescent

β Inner petals scarcely smaller than the outer, blunt
7899 Petals many, Anthers lengthened beyond the cells into a linear appendage

and Miscellaneous Particulars.

Persia, and some parts of the Russian empire. Thunberg informs us, that it is considered as a sacred plant in Japan, and pleasing to their deities, and that the images of their idols were often drawn sitting on its large leaves. The long stalks are there eaten among other potherbs. Loureiro relates, that it abounds in muddy marshes in India and China, and is cultivated in large handsome pots in the gardens and houses of the mandarins; that there is a variety with the flower of a pure white, and another with a very beautiful luxuriant flower, having about one hundred large petals, white or rose-colored. Both root and seeds are esculent, sapid and wholesome. In China it is called Lien-wha, and the seeds and slices of the hairy root, with the kernels of apricots and walnuts, and alternate layers of ice, were frequently presented to the British ambassador and his suite at breakfasts given by some of the principal mandarins. The Chinese have always held this plant in such high value, that at length they regarded it as sacred. That character, however, has not limited it to merely ornamental purposes; for the roots are not only served up in summer with ice, but they are also laid up in salt and vinegar for the winter. The seeds are somewhat of the size and form of an acorn, and of a taste more delicate than that of almonds. The ponds are generally covered with it, and exhibit a very beautiful appearance, when it is in flower; and the flowers are no less fragrant than handsome.

Sir George Staunton remarks, that the leaf, besides its common uses, has, from its structure, growing entirely round the stalk, the advantage of defending the flower and fruit arising from its centre from contact with the water, which might injure them. He also remarks, that the stem never fails to ascend in the water from whatever depth, unless in case of a sudden inundation, until it attains the surface, when its leaf expands, rests, and swims upon it, and sometimes rises above it. This plant bears the rigorous cold of the Pekin winter, though it is reared with difficulty in European stoves. It often grows spontaneously in China, and is propagated in the open air with ease both by the seed and root. The Chinese distinguish many varieties of it.

From the root of the Nelumbo, Sir George Staunton says, the Egyptians are supposed to have prepared their Colocasia, but the plant is now no longer found in that country; from which circumstance some naturalists infer, that it never was indigenous there, but cultivated by the inhabitants with extreme care. The ancient Romans made repeated efforts to raise it among them, from seeds brought out of Egypt; and the

History, Use, Propagation, Culture,

modern attempts to cultivate it in Europe, though with the assistance of artificial heat, seldom have succeeded.

Dr. Patrick Browne is of opinion that the ancients confounded two plants under the name of Lotus or Egyptian bean, and that under these titles they described the upper parts of the Nymphæa Nelumbo, and the roots of the lesser Colocasia, now commonly called *coccos* in Jamaica, Arum Colocasia. (*Jam.* 243. 332.)

In our stoves the Nelumbium should be grown in a tub or large pot, in a rich loamy soil, and requires a strong heat to flower in perfection. The pot or tub should be kept full of water all the time the plants are growing, but may be allowed to get dry when the flowering season is over. The plants may be increased by dividing at the root, but it is obtained more readily from seeds, which vegetate freely. (*Bot. Cult.* 83.)

Kent of Clapton says, that the seeds will keep forty years, vegetate freely, and flower the first year. (*Hort. Trans.* iii. 36.)

1214. *Dillenia.* So named by Linnæus, in honor of John James Dillenius, the famous professor of botany at Oxford, author of Historia Muscorum, Hortus Elthamensis, &c. The species are beautiful trees, with large leathery leaves, and axillary or terminating flowers often also large. They thrive best in a light loamy soil. Ripened cuttings, not deprived of their leaves, strike root freely, in a pot of sand plunged under a hand-glass in heat. Good seeds sometimes arrive from India, when the sooner they are sown the better; placed in a moderate hot-bed frame, they will succeed well. (*Bot. Cult.* 50.)

1215. *Illicium.* From *illicio*, to attract, on account of its agreeable perfume. I. floridanum has very fragrant leaves, and capsules having a strong smell of anise when rubbed. This species, and more especially anisatum is powerfully carminative and stomachic. In China it is in frequent use for seasoning dishes, especially such as are sweet. In Japan they place bundles and garlands of the aniseed-tree in their temples before their idols, and on the tombs of their friends. They also use the powdered bark as incense to their idols. A branch put into the decoction of Tetraodon hispidum is supposed to increase the virulence of that poison. The bark, finely powdered, is used by the public watchmen to make a chronometer or instrument for measuring the hours, by slowly sparkling at certain intervals in a box, in order to direct when the public bells are to sound.

Ripened cuttings will root in sand, but the plant is most readily increased by layers.

1216. *Liriodendron.* From λειριον, a lily, and δενδρον, a tree. The flowers, which may be likened to a lily or tulip, grow upon one of the loftiest trees of the forest. A smooth tree, not less admired for its fiddle-shaped leaves, than its tulip-like flowers, which are produced at the end of the branches; they are composed of six petals, three without and three within, which form a sort of bell-shaped flower, whence the inhabitants of North America gave it the title of tulip. These petals are marked with green, yellow, and red spots, making a fine appearance when the trees are well charged with flowers. When the flowers drop the germ swells, and forms a kind of cone, but it does not ripen in England.

The timber is used in America for canoes, but is unfit for boards or planks, as it contracts and expands more than the wood of any other tree.

The tulip tree is now very common in Europe; in the south of France and Italy, it is frequent in public avenues, and flowers when twenty or thirty feet high, and of six or seven years growth. In Britain it requires a

7900 Leaves elliptic oblong simply serrated, Peduncles 1-flowered

7901 Petals 27-30 purple: outer oblong; inner lanceolate
7902 Petals 9-12 yellowish ovate roundish

7903 Leaves truncate at end with two broad opposite stipules

7904 Leaves evergreen oval-obl. coriaceous shining above ferrugineous beneath, Flowers erect with 9-12 petals

7905 Leaves elliptical blunt glaucous beneath, Flowers with 9-12 contracted petals which are ovate concave
7906 Like the last, but leaves evergreen elliptical acute at each end
7907 Lvs. deciduous obovate abruptly acuminate the younger pubescent, Flowers naked erect with 6-9 petals

7908 Lvs. deciduous obov. acute netted nearly smooth, Fls. erect, Sepals 3, Petals 6 obovate, Styles very short
7909 Lvs. decid. obov. point. at each end, younger downy ben., old ones smooth, Fls. erect, Sep. 3, Pet. 6, Styles [very short

7910 Leaves evergreen smooth netted ellipt. acuminate at each end subglaucous, Flowers cernuous
7911 Leaves evergreen elliptic obl.: the old smooth; younger and branches fuscous downy, Flowers erect

7912 Lvs. deciduous heart-shaped subovate acute, above smooth, beneath somewhat tomentose, Pet. 6-9. obl.
7913 Leaves deciduous oval acuminate pubescent beneath, Petals 6-9
7914 Leaves deciduous lanc. much spreading, younger downy beneath, Petals 9-12, the outer hanging down

7915 Lvs. deciduous very large obl. obov. subcuneate cordate at base, beneath whitish glaucous, Pet. 6-9 ovate

7917 Lvs. decid. smth spatul. obov. subcord. at base, of same color on both sides, Auric. spread. Pet. 9 lanc. acum.

and Miscellaneous Particulars.

greater age, though ringing might probably be successfully applied to throwing this and other ornamental trees into a flowering state. There are many fine old trees round London, in the parishes of Fulham, Walham-green, Kew, &c., and a very fine one even so far north as Pitcaithly wells in Fifeshire.

1217. *Magnolia.* In honor of Pierre Magnol, professor of medicine, and prefect of the botanic garden at Montpelier; author of Botanicum Monspeliense, 1676, and other works. The species are chiefly large trees with large leaves, and axillary flowers, also very large and highly odorous.

M. grandiflora is the noblest species; the leaves, which are persistent, are nine or ten inches long, and not unlike those of a common laurel. The flowers are produced at the ends of the branches: they are very large, and composed of eight or ten petals, narrow at their base, but broad, rounded, and a little waved at their extremities; they spread open very wide, are of a pure white color, and have an agreeable scent.

The variety g. elliptica or Exmouth (having been raised from the seed of an old tree in Sir John Collington's garden of that place) flowers earliest and most freely: it is also the hardiest.

M. glauca is deciduous. In America it is known by the names of *white laurel*, *swamp sassafras*, and *beaver tree*. It has the last name, because the root is eaten as a great dainty by beavers; and this animal is caught by means of it. Kalm says, these trees may be discovered by the scent of the blossoms at the distance of three quarters of a mile, if the wind be favorable. It is beyond description pleasant to travel in the woods at the flowering season, especially in the evening. They retain their flowers for three weeks, and even longer. The berries also look very handsome when they are ripe, being of a rich red color, and hanging in bunches on slender threads. They cure coughs and other pectoral diseases by putting these berries into brandy, and giving a draught of the liquor every morning. The wood is made use of for joiners' planes. Dillenius remarks, that the flowers never open in a morning, that the calyx falls off at the second opening of the flower, but that the petals dry on, and that the scent resembles that of the lily of the valley, with a mixture of aromatic.

M. conspicua is much valued as a free flowerer, and on account of the early appearance of its white odoriferous blossoms. *Yulan* is the vernacular name in Japan.

M. acuminata bears a fruit about three inches long, like a small cucumber, and is thence called cucumber tree in America.

M. tripetala has leaves twelve or fifteen inches long and five or six inches wide, narrowing to a point at each extremity, and placed at the ends of the branches in a circular manner like an umbrella, whence its name. The flowers are composed of ten, eleven, or twelve large oblong white petals; the wood is soft and spongy, and the leaves drop off earlier than in the other deciduous sorts.

The different species, Sweet observes, are generally increased by layers or seeds: when the layers are first taken off they should be potted in a mixture of loam and peat, and placed in a close frame till they have taken fresh root. None of the leaves should be taken off or shortened, nor any shoots be cut off, or their tops shortened, as they will not succeed so well; for the more branches and leaves are on them, the sooner they will strike fresh root. Most cultivators cut off many of the leaves and shoots of layers, when they are first taken off, thinking the roots will not have so much to nourish, which is the very reason

History, Use, Propagation, Culture,

they often lose great part of their crop; layers of any kind of shrub whatever, when first taken off, should not have a single leaf taken off till they have made fresh root: supposing their tops flag ever so much, as long as there is life it will draw up the sap, and help the plant to root afresh. The Chinese kinds are often inarched or budded on M. obovata, which takes readily. (*Bot. Cult.* 306.)

1218. *Michelia.* Named by Linnæus, in honor of Pietro Antonio Micheli, of Florence, author of Nova Plantarum Genera, Flor. 1729, fol. A lofty tree, with fragrant flowers, and fruit edible, but not agreeable. In our stoves it grows well in light loam, and cuttings root in sand under a glass and plunged in heat.

1219. *Uvaria.* The fruit grows in bunches like a small bunch of grapes, whence it has been called *Uvaria* from *Uva.* The berries are considered a specific for gonorrhœa, and are used under the name of *cubebs.* These are trees or shrubs with erect or trailing stems, and 1-4-flowered axillary peduncles.

1220. *Anona.* This is called by the Malays, *manoa*, and at Banda, *menona*, which it is presumed that the Europeans have corrupted into Anona. As the word signifies in Latin food, it has been adopted by Linnæus in this sense, because of the habitual use made of the fruit by the Americans. The species are for the most part fruit trees, with soft pulpy subacid berries, sometimes as large as an orange, but generally more like a plum.

A. muricata is common in every savannah of Jamaica, flowering in the spring. The large succulent fruit is agreeable to new-comers and over-heated habits; but it is so common, and so much in use among the negroes, that it is now hardly ever used among the better sort of people. The smell and taste of the fruit, flowers, and whole plant, resemble very much those of black currants.

A. tripetala is a large tree with large bright green leaves. The fruit is oblong, scaly on the outside, and of a dark purple color when ripe; the flesh is soft and sweet, and has many brown seeds intermixed with it which are very smooth and shining. It is esteemed by the Peruvians as one of their most delicate sorts.

A. palustris grows wild in soft marshy places in Jamaica, and bears a fine sweet-scented fruit, of no disagreeable flavour; but it is said to be a strong narcotic, and is not eaten on that account. It is called alligator apple. The wood of this tree is so very soft, even after it is dried, that it is frequently used by the country people instead of corks, to stop up their jugs and calabashes; whence it has now universally obtained the name of cork-wood in Jamaica. (*Browne.*)

To bear fruit in our stoves, these trees require a rich loamy soil, rather moist, and to be trained on a wall or trellis close under the glass. Ringing would also be useful. They are propagated by ripened cuttings, of a good size, with their leaves on, planted in sand, and plunged in heat.

7918 Leaves lanceolate smooth

7919 Leaves lanc. acuminate, Pedunc. lateral solitary 1-flowered

7920 Leaves ovate lanceolate smooth somewhat shining, Pedunc. solitary 1-flowered
7921 Leaves ovate lanceolate not dotted very finely silky beneath, Outer petal downy outside

7922 Leaves lanceolate smooth with pellucid dots, Outer petals smooth
7923 Leaves obl. acute somewhat downy above, silky and rufous beneath, Flowers on short stalks
7924 Leaves obl. lanc. acute smooth somewhat dotted, Outer petals obl. somewhat closed
7925 Leaves ovate obl. coriaceous very smooth, Fl. solitary stalked
7926 Leaves ovate lanc. smooth, Pedunc. opposite the leaves 2-flowered

7927 Leaves obl. lanc. acuminate smooth shining

7928 Leaves oval acuminate cordate covered beneath, as on the branches, with brown down
7929 Leaves ovate acuminate very smooth nearly sessile, Pedunc. axillary 1-flowered

7930 Leaves obl. cuneate acuminate, Branches quite smooth
7931 Leaves cuneate obovate mucronate beneath, as on the branches, rufous with down
7932 Leaves obl. linear long-cuneate, Branches quite smooth

7933 Leaves lanc. acuminate strigose beneath bearded at end
7934 Leaves obl. ovate smooth, Pedunc. 1-fl. solitary

7935 Leaves cordate 3-lobed, Lobes entire

and Miscellaneous Particulars.

1221. *Artabotrys.* This name was suggested by the curious grapple or tendril belonging to the peduncle, by which the growing fruit is conveniently suspended on the nearest support. A beautiful Chinese plant, cultivated as an ornamental covering to walls, as well as on account of the fragrance of the blossom, which diffuses an odor like that proceeding from the finer kinds of ripe fruit. The genus is intermediate, between Kadsura and Guatteria.

1222. *Guatteria.* Named by the authors of the Flora Peruviana, after John Baptist Guatteri, an Italian professor of botany at Parma. G. virgata is one of the best timber trees in Jamaica for strength and elasticity; it is imported under the name of lance-wood, and much used by coachmakers for shafts to light carriages.

1223. *Asimina.* A name coined by Adanson, without any meaning. Shrubs with deciduous, oblong, often cuneate leaves, and axillary flowers, which often appear before the leaves. The species are natives of shady woods in the more southern provinces of North America.

1224. *Xylopia.* Named by syncope from ξυλον πικρον, bitter wood, in allusion to the properties of the wood. Fruit-bearing trees, but not in much esteem as such. X. glabra is the most useful species. The wood, bark, and berries have an agreeable bitter taste, not unlike that of the orange seed. The wild pigeons feed much upon the latter, and owe that delicate bitterish flavor, so peculiar to them in the season, wholly to this part of their food. Fresh gathered from the tree, they are agreeable to the palate and grateful to the stomach. The bark is also richly impregnated with this juice as well as the wood, and both yield a very agreeable bitter in the mouth while fresh; but that delicacy diminishes greatly after they are dried. The wood is easily wrought, and esteemed a good timber where it is not much exposed to the weather. The bitter quality of this tree is communicated with great facility. A handful of the shavings immersed in water and instantly taken out again, will render it of a very bitter taste. Sugar sent over in hogsheads made of this wood was so bitter that no person would purchase it. Bedsteads and presses made of it, are proof against cockroaches and other insects. Carpenters who work the wood, perceive a bitter taste in their mouths and throats. A decoction of it is said to be of service in cholics, and to create appetite.

1225. *Hepatica.* From ἡπατικος, of or relating to the liver. The three lobes of the leaves have been compared to the three lobes of the liver. A great favorite of the flower border, both as being evergreen in its foliage, and for its abundant blossoms and great variety of colors and shades.

History, Use, Propagation, Culture,

1226. *Anemone.* From ανεμος, wind, because the greater part of the species grow in elevated places much exposed to the wind. The species are shewy flowering plants, and A. coronaria and hortensis are well known florists' flowers, valued for their hardy nature, and also because they will flower at almost any season, according to the time the roots are kept out of the ground, and the season when they are replanted. The prevailing colors are red, white, and blue, and semidouble flowers are in nearly as much repute as double ones. Many new varieties have been raised from seed; but they are not named by the florists, as in the case of tulips and and pinks. The roots of anemones are solid flattened masses like those of ginger, and like them are multiplied by division. A root which has remained in the soil two or three years, if it has room to extend, attains a great breadth, but is still only one root; and hence the mode of sale is by weight, and the roots are divided when planted.

The soil preferred by the anemone is a fresh loam, rather heavy or light. The usual time of planting is the end of October, covering the roots three inches; but to have an early bloom they may be planted in the beginning of September, and to have a bloom every month in the year, plant every month. The finer sorts

7936 Leaves ternate with multifid segments and linear mucronate lobes, Sep. 6 oval close

7937 Leaves 3-parted with cuneate cut-toothed lobes, Involucre sessile obl. entire or cut, Sepals 10-12 oblong

7938 Leaves cordate roundish bluntly 3-5-lobed toothed, Involucre sessile trifid, Sepals 10-12 oblong
7939 Leaves ternate with cut-toothed ciliated segments, Involucre on short stalks 3 cut, Sepals 6 round
7940 Leaves ternate or quinate, Segments cut-toothed at the end, Involucre stalked similar, Sepals 5 obovate
7941 Lvs. biternate with a branch. stalk, Segm. many-part. with lin. lobes, Inv. shortly stalk. multifid, Sep. obl.
7942 Leaves ternate or quinate, Segm. cut-toothed at end, Involucre stalked similar, Sepals 6 elliptical
7943 Leaves 3-parted with cuneate cut-toothed lobes, Involucre sessile oblong entire or a little cut, Sep. very acute
7944 Leaves ternate with trifid acuminate cut-toothed segments, Involucre stalked similar, Sepals 5 elliptical
7945 Involucre leaves on short stalks thrice cut with linear cut-toothed segments, Sepals 5-6 oval-oblong
7946 Leaves 3-parted with cut-toothed acuminate lobes, Involucre sessile similar, Sepals 5 elliptical, Fruit hairy
7947 Leaves 3-parted with cut-toothed oblong lobes, Involucre sessile similar, Sepals 5 elliptical, Fruit smooth
7948 Leaves all stalked ternate with ovate lanc. acute-toothed segments, Sepals 5 elliptical obtuse
7949 Leaves ternate with trifid cut-toothed lanc. acute segments, Involucre stalked similar, Sepals 6 elliptical
7950 Leaves 3-ternate with a branched stalk, Sepals 12-14 oblong obtuse, Leaves of involucre stalked
7951 Radical lvs. 3-5 cut with subtrifid cut-toothed segments, Involucre stalk. 3-parted toothed, Sep. 5-6 elliptical
7952 Radical leaves villous palmate 3-5-parted with cut-toothed lobes, Lobes lin. acute, Fl. umbelled
7953 Flowers umbelled, Floral leaves stalked biternate forming a sort of involucre
7954 Leaves biternate with a branched petiole, Segm. pinnated cut serrate, Sepals 6 spreading
7955 Leaves pinnated with multifid segments, Lobes linear, Flowers pendulous, Sepals 6 erect reflexed at end
7956 Like the last, but the flower larger and paler, and the lobes of the pinnæ broader and awned
7957 Leaves pinnated with multifid segments, Lobes linear, Flower somewhat nodding, Sepals 6 spreading
7958 Leaves pinnated very villous with 3-parted segments, Lobes lanc. lin. acum. Fl. erect, Sep. 6 oval lanceol.
7959 Leaves pinnated with cuneate lanceolate trifid smoothish segments, Fl. erect, Involucre very villous
7960 Leaves pinnated villous beneath, Segm. pinnatifid, Lobes cut oblong, Fl. subcernuous, Sep. 6 spreading
7961 Leaves pinnate coming after the flowers, Segm. 3-parted, Lobes toothed cut at end, Fl. erect spreading
7962 Leaves biternate rigid smooth, Segm. cuneiform toothed at end

7963 Pedunc. 1-fl. longer than leaf, Lvs. biternate, Segm. ovate-lanc. acum. serrate, Pet. subspatulate obtuse
7964 Pedunc. 1-fl. the length of leaf, Leaves biternate with obl. lanc. acumin. segments, Pet. emarginate at end
7965 Pedunc. 1-fl. Leaves whorled in fours ternate, Segm. stalked cordate lanc. entire, Petals acute

7966 Leaves pinnate, Segm. glaucous smooth cuneiform lobed, Lobes entire blunt, Pedunc. trifid
7967 Fl. panicled, Leaves ternate, Segm. ovate lanc. acumin. nearly entire smooth 5-nerved at base
7968 Leaves pinnated, Segm. ovate lanc. entire, Pedunc. few-fl. longer than leaf, Ovaries about 4, Tails almost [naked
7969 Pedunc. 1-fl. with an involucrum, Leaves ovate subcordate toothed fascicled
7970 Pedunc. 1-fl. longer than leaf, Leaves tern. decompound, Segm. ovate acute entire, Sepals much pointed

7971 Pedunc. 1-fl. longer than leaf, Leaves entire or ternate decomp. Lobes or segm. entire, Sepals obovate

7972 Pedunc. 1-fl. Sep. connivent thick reflexed at end acuminate, Lvs. smooth with ent. or 3-lob. ov. acute segm.
7973 Pedunc. 1-fl. Sep. connivent, Lvs. coriaceous netted nerved smooth with stalked 3-lobed or entire segments
7974 Pedunc. 1-fl. Sep. acumin. wavy at edge thin, Lvs. smooth thin decompound with stalked ov or obl. segm.
7975 Pedunc. 1-fl. shorter than leaf, Leaves entire 3-lobed very acute, Sepals conniving at base spreading at end
7976 Pedunc. 1-fl. with an involucre under the leaf, Leaves ternate with stalked ternate cut-toothed segments

7977 Leaves pinnate with glaucous smooth wedge-shaped 3-lobed segments, Lobes toothed acuminate
7978 Fl. panicled dicœcious, Leaves ternate, Segm. cordate acute coarsely toothed and lobed
7979 Fl. panicled dicœcious, Lvs. tern. Segm. smooth ovate cordate acuminate 3-nerved ent. Pedicels pubescent
7980 Fl. panic. dicœc. Sep. 4. Lvs. tern. Segm. ovate subcord. acute coarsely toothed 3-nerv. Anth. awned at end
7981 Ped. 3 1-fl. or 3-fid or panic. long. than lvs. Lvs. tern. or pinn. Segm. ovate coarsely toothed, Fl.-buds globose

and Miscellaneous Particulars.

require protection from violent storms and excessive light and heat; but many varieties do exceeding well in borders. A very severe winter will destroy the roots if the surface is not mulched; but the anemone is considerably hardier than the ranunculus. Anemone pulsatilla is common in borders. The roots are mostly tuberous, and when taken up should not be long kept out of ground. Like most tuberous plants, they thrive best in a sandy loam.

1227. *Clematis.* From κλημα, a tendril; the climbing habit of this genus is well known. The species are mostly climbing shrubs of rapid growth, free-flowerers, very ornamental, and some are highly odoriferous. C. florida, viticella, and flammula are admired species. The plants formerly called Atragene, but now properly united to Clematis, are shewy climbers, especially C. austriaca, which grows and flowers freely. Any common garden soil will suit them, and they are readily increased by layers; or young cuttings, planted under a common hand-glass, will root freely. Seeds are often ripened in abundance, by which any quantity may be raised; they are best sown in pans, or wide-mouthed pots, and placed in a shady situation, where they will

History, Use, Propagation, Culture,

remain some time before they come up; they may then be potted off, or planted out in the ground, when they will require to be shaded a little if the weather be warm, till they have taken fresh root. (*Bot. Cult.* 281.)

1228. *Naravelia.* An alteration of *narawæl*, the name by which the plant is known in Ceylon. A plant with the habit of Clematis, but bearing leaves of only one opposite many-nerved pair, like Lathyrus.

1229. *Thalictrum.* This name is said to be derived from θαλλω, to grow green; from the bright color of the young shoots. The species are vigorous growing plants, with ramose roots and smooth finely divided leaves; they grow in any soil and situation, and T. tuberosum, cornuti, and aquilegifolium, are reckoned handsome ornaments in a border or shrubbery.

1230. *Adonis.* The plant which sprang from the blood of Adonis when wounded by the boar. Handsome border flowers, especially A. vernalis and autumnalis, and of the easiest culture in any common soil.

7982 Leaves pinnate with smooth subglaucous ovate cut-toothed 3-lobed segments
7983 Lvs. pinn. Segm. ovate-lanc. cut-toothed acuminate truncate cordate at base, Pedunc. shorter than leaf
7984 Leaves pinnate, Segments smooth entire or 3-lobed round oval oblong or linear rather acute
α Segments nearly round

β Segments oval or oblong lanceolate
γ Segments linear
7985 Leaves pinnate with stalked ovate-lanc. entire segments
7986 Pedunc. 1-fl. Sepals 6-8 blunt, Leaves pinnate, Segm. lanc. lin. acute or 3-lobed, Stems erect
7987 Pedunc. 1-fl. Fl. suberect, Leaves entire ovate; young ones silky
7988 Pedunc. 1-fl. Fl. nodding, Leaves entire ovate lanc. smooth

7989 The only species

7990 Stem simple almost naked, Raceme simple terminal, Fl. nodding, Segm. smooth
7991 Stem simple naked at base: leafy in middle; panicled at end, Lvs. pubescent viscid, Segm. blunt toothed
7992 Fl. loosely corymbose or subsolitary, Involucre none, Bract subsessile
7993 Fl. dicœcious, Filam. clavate at end, Pericarp obl. sessile striated, Segm. of leaves bluntly 3-lobed

7994 Fl. dicœcious, Fil. filiform, Segm. of leaves roundish cordate bluntly lobed smooth
7995 Stem round without bloom, Fl. panicled erect, Segm. of leaves smooth ovate or subcordate subtrifid
7996 Stem round without bloom, Fl. loosely panic. Segm. of leaves smooth glauc. ben. Peric. obliq. round. at base
7997 Stem round without bloom, Fl. loosely panicled, Segm. of lvs. obl. cuneiform sharply trifid; upper entire
7998 St. round cover. with a glauc. bloom, Fl. loose. pan. cern. Segm. of lvs. roundish tooth. at end, glauc. beneath
7999 Stem round upright, Fl. cernu. in a very large spreading panic. Segm. of lvs. smooth cuneif. trifid acute
8000 St. erect round striat. green, Pan. erect. comp. Fl. clust. Segm. of lvs. ov. subcord. coarsely cren. shin. above
8001 Stem roundish, Fl. panic. cernuous, Segm. of lvs. smooth ov. cuneate trifid, Lobes acute entire or finely cut
8002 Stem round, Fl. panicled cernuous, Petioles stem-clasping winged
8003 Stem simple covered with scattered leaves panicled at end, Stem downy viscid
8004 Fl. dicœcious or monœc. Filam. filif. colored, Segm. of lvs. roundish coarsely tooth. smooth glauc. beneath
8005 Stem upright round somewhat furrowed, Root fibrous, Panic. multiple erect, Segm. of lvs. lin. lanc. entire
8006 St. branch. round somew. furrow. Root fibr. Pan. multiple erect, Segm. of lvs. lin. lanc. ent. cuneate at base
8007 Stem branch. erect somewhat furrowed, Root fibr. Pan. multiple erect, Segm. of lvs. cuneiform trifid acute
8008 St. branch. erect somew. furrow. Root fibr. Pan. multiple erect, Segm. of rad. lvs. cuneif. trif. Caul. obl. lin.
8009 Stem erect round striat. glauc. Pan. multip. erect close, Seg. of lvs. subcord. ov. bluntly trifid glauc. beneath

8010 Leaves simple 5-lobed serrated
8011 Stem erect simple angular, Root creeping, Panic. erect racemose few-flowered, Segm. of leaves linear
8012 Stipules ovate, two at the base of the ramifications of the petiole, Panic. corymb. Fruit 3-cornered

8013 Stem round upright somewhat furrowed, Root creeping, Panic. erect, Segm. of lvs. lin. very narrow entire
8014 Stipules O, Fl. loosely corymbose racemose, Fruit 3-cornered pendulous
8015 Stem round nearly naked, Fl. corymb. Filam. dilated at end, Segm. of lvs. smooth ovate entire or 3-lobed

8016 Cal. hispid at base, Pet. flat obl. blunt, Fruit netted in a long lax spike
8017 Cal. smooth, Pet. conc. conniving scarcely longer than cal. Fruit netted in an ovate head
8018 Cal. hispid at base, Pet. flat acute longer than cal. Flower large, Fruit in a cylindrical head
8019 Lower leaves abortive, Upper sessile, Fruit velvety, Pet. 10-12 oblong somewhat toothed
8020 Cal. smooth distinct at base, Pet. flat obl. twice as long as cal. Fruit smooth in an oblong head
8021 Rad. leaves on long stalks, Stalks trifid, Fruit smooth, Pet. 8-10 obl. cuneate entire

8022 Umb. supradecompound much spreading
8023 Umb. simple few-flowered

8024 Root grumous, Stem leafy, Leaves cordate

and Miscellaneous Particulars.

1231. *Knowltonia.* Named after Thomas Knowlton, once the curator of the botanic garden at Eltham. The species grow freely in loam and peat, and are increased by dividing at the root, and by seeds.

1232. *Ficaria.* So named because the grumous roots bear tubercles like little figs. A common wood plant, remarkable for its shining leaves and bright yellow flowers. The young leaves are sometimes used as greens in Sweden, and the roots were formerly applied in poultices to piles in England, probably from their resemblance to that disease. These roots or tubercles lie near the surface, and are sometimes laid bare by the rains, and in this state have induced the ignorant, under the influence of superstition, to fancy that it rained wheat. The plant is injurious in moist grass lands, but is effectually destroyed by a dressing of coal or wood ashes.

History, Use, Propagation, Culture,

1233. *Ranunculus.* Said to be so called from *rana*, a frog, because the species inhabit humid places frequented by that reptile. *Renoncule*, Fr., *Ranunkel*, Ger., and *Ranuncole*, Ital. Some of the species are weeds, one or two border flowers, and R. asiaticus is one of our most esteemed florists' flowers. Some of the species are tuberous and others bulbous rooted, but the most part are tuberous. R. sceleratus is one of the most virulent of our native plants. Bruised and applied to the skin it soon raises a blister, and makes a sore by no means easy to heal. Strolling beggars have been said to use it for that purpose, in order to excite compassion. When chewed, it inflames the tongue; and when taken into the stomach, it produces violent effects. It is suspected to have proved poisonous to sheep.

R. aconitifolius is a handsome plant, with branching stems, deep green leaves, and pure white flowers; the double variety is an old and much admired border flower.

Of R. asiaticus the varieties raised from seed are endless. Maddock, in the end of the last century, had nearly eight hundred, all with proper names, and ranged as purple, gray, crimson, red, rosy, orange, yellow, white, olive, coffee, striped, spotted, &c. No plant is more prolific in new varieties from seeds; no two plants, as Maddock observes, producing flowers alike, or the same as the original. Established sorts are propagated by offsets, which generally flower the first year: rare sorts may be multiplied by dividing the crown of the tuber with a sharp penknife into as many parts as there are buds: these will not flower till the second year, but will diminish the risk of losing a very rare variety.

The ranunculus prefers a fresh loamy soil, rather than otherwise inclined to clay: it should be well manured; and it is customary, in forming the beds, to place a stratum of well rotted cow-dung six or nine inches below the surface, which both retains moisture and supplies nourishment. The roots may either be planted in November or earlier, in which case, to prevent their being destroyed by the frost, they should be mulched, or they need not be planted till March. The former mode gives much the strongest bloom, as the roots, when kept in air all the winter, are apt to be over dried, and kept in sand they sometimes get mouldy: and in this and similar cases, the progress of vegetation from the planting to the blossoming period, is more rapid than is natural to the species. Ranunculus roots will retain their vegetative properties two and sometimes three years; a thing not common among bulbs and tubers, unless preserved dormant in an ice cold room.

R. bulbosus has a solid white bulb about the size of that of the common Crocus. The flowers are some-

8025 Leaves smooth lin. lanc. : lower stalked, Stem declinate solid rooting at base, Fruit smooth
8026 Leaves lin. entire smooth, Stem creeping and rooting at every joint
8027 Leaves lanc. subserrate sessile half stem-clasping, Stem erect smooth
8028 Rad. leaves stalked oval-obl. Fl. sess. opposite the leaves, Fruit granular scarcely crowned with the style
8029 Leaves lanc. or lin. entire, Stem erect very smooth, Scales of the petals tubular
8030 Rad. leaves stalked subcordate ovate-roundish : cauline sessile ovate-lanc. Pedunc. hirsute
8031 Leaves oval-lanceolate acuminate stem-clasping, Scape and peduncles smooth
8032 All the leaves radical-stalked ovate toothed, Scapes naked 1-flowered
8033 Leaves smooth reniform crenate, Floral cut, Stem 2-3-fl.-smooth
8034 Lvs. woolly 3-lobed with trifid toothed cuneate lobes : upper 3-parted with entire lin. lobes, Cal. reflexed
8035 Leaves cuneiform irregularly cut at the end, Stem smooth branched many-fl. Cal. appressed
8036 Lower leaves stalked cordate blunt : upper obl. sessile, Stem erect hollow, Fruit granular
8037 Rad. lvs. stalked oval or subcord. 3-5-tooth. at end, Runners from neck of plant, Scapes naked 1-fl. erect
8038 Lvs. very smooth many-parted, Lobes obl. Scapes many 1-fl. with appressed hairs, Cal. spreading smooth
8039 Covered with soft hairs, Rad. lvs. stalk. cord. orbic. somewhat cut-tooth. Stem branched, Cal. appressed
8040 Lvs. smooth : radic. stalked reniform crenate ; caul. in linear lobes, Cal. pubescent shorter than petals
8041 Leaves smooth : radic. stalked cordate generally 3-parted or lobed, Calyx pubescent shorter than petals
8042 Lvs. smooth : radic. stalk. cordate-roundish crenate some 3-parted or cut, Cal. smooth longer than petals
8043 Lvs. smooth : radic. stalk. 3-part. Lobes 3-lob. bluntly cut, Cal. smooth, Fruit very small in an obl. spike
8044 Lvs. palm. 3-7-parted cut-toothed : upper sessile with lin. lanc. lobes, Stem branch. many-fl. Cal. appressed

β Radic. leaves 5-7-lobed with acuminate lobes, Bractes lin. entire
8045 Leaves smooth : radic. stalked 3-parted or pedate ; upper linear, Stem erect few-fl. Calyx appressed
8046 Lvs. silky : first ent. lin. lanc. ; rest 3-part. with entire or 3-part. lobes, Stem many-fl. Cal. somewhat reflexed

8047 Leaves tern. or bitern. Segm. toothed or cut trifid, Stem erect simple or branched, Fruit in a cylindr. spike
8048 Rad. lvs. stalked villous 3 cut : first ovate toothed or 3-lobed, Stem erect 1-2-fl. Cal. spreading subreflexed
8049 Leaves pinnate with 3-lobed cut multifid lobes, Stem about 1-fl. Cal. smooth, Pet. 8-10
8050 Radical leaves stalked palmate 3-parted with trifid blunt thick lobes, Calyx very hirsute
8051 Leaves smooth : radical stalked 5-fid with entire ovate lobes, Calyx very hirsute twice as short as petals
8052 Rad. lvs. smooth 3-parted round with trifid blunt segments : cauline sess. linear-lobed, Cal. nearly smooth
8053 Leaves round 3-lobed, Lobes blunt crenate at end, Stem about 1-fl. Cal. smooth, Pet. obcord. or 3-lobed
8054 Stem and petioles cover. with stiff hairs, Lvs. 3-fid with stalk. acutely 3-lob. segm. Cal. reflex. Style smooth
8055 Rad. lvs. stalked 3-cut with trifid cut segm., of which the middle one is stalked, Stem erect, Cal. reflexed
8056 Lvs. 3-lob. with blunt cut lobes, of which the mid. is stalk. Cal refl. Grains with a single row of minute warts
8057 Stem and petioles with soft hairs at base, Lvs. smooth. trif. with 3-lob. ac. cut segm. Cal. smooth spreading
8058 Lvs. pinnate 3-fid with cuneate 3-lobed cut segm. Runners creeping, Cal. erect, Grains with an acute point

8059 Lvs. 3-5-lob. with lin. divisions, Stem erect and petioles with spreading hairs, Pedunc. furrowed, Cal. hairy
8060 Lvs. pubesc. or smooth, Lobes cut-tooth. acute : upper lin. Stem many-fl. pubesc. Cal. vill. Grains mucron.

and Miscellaneous Particulars.

times double, but not so frequently as R. acris. It is distinguished from R. repens, with which it has been confounded by some authors, by its roots, by its never throwing out runners, and by its reflexed calyx ; this last character arises from its particular structure, the lower half being thin and almost transparent, and therefore not having a sufficient degree of solidity to support itself upright. It is the second flower which, next to the Dandelion, covers the meadows with dazzling yellow. Like most of the Crow-foots, it possesses the property of inflaming and blistering the skin ; particularly the root, which is said to raise blisters with less pain and more safety than Spanish flies ; hence these roots have been applied for that purpose, particularly to the joints in cases of the gout. According to Hoffman, beggars make use of them to blister their skins, with a view of exciting compassion. The juice of the herb is said to be more acrid than that of R. sceleratus, and if applied to the nostrils, it provokes sneezing. The roots, on being kept, lose their stimulating quality, and are even eatable when boiled. Hogs are fond of them, and frequently dig them up. The herb is too acrid to be eaten unmixed by cattle ; accordingly the flowering-stalks are left to perfect the seed in pastures : some of it, however, is consumed, and it is not improbable that this and other pungent plants, mixed with the grasses, may act as a powerful stimulus to some animals, as salt does to others. It abounds in dry pastures, and flowers in May. Besides the name of round-rooted or bulbous Crowfoot, it is called by the common people butter-flower, butter-cups, king-cups, gold-cups ; and it is the cuckoo-buds of yellow hue, of Shakspeare. R. repens, hirsutus, and acris, however, are all confounded with this under one name by the vulgar.

R. repens is an obnoxious plant in every description of gardening and agriculture. From the great variety of soil and situation in which it is found, it assumes many varieties ; by a river's side, or in marshes, it will grow three or four feet high, with a stem nearly as large as the human thumb ; in barren gravelly fields it is entirely procumbent, with a stem not larger than a small wheat-straw ; but in all states it retains the character of the creeping stem, and it does not lose it in cultivation. Its principal time of flowering is in June, but it may be found in blossom during most of the ensuing summer months in meadows and pastures, under hedges, in shady waste places, church-yards, and gardens. The qualities of this and bulbosus are similar : both blister the skin, and are very acrid in taste. Like R. acris and bulbosus, it is sometimes found double, but more rarely.

R. acris is supposed to possess the blistering property in a considerable degree, whence Linnæus gave it the

History, Use, Propagation, Culture,

name of acris. Curtis says, that even pulling up the plant, and carrying it to some little distance, has produced a considerable inflammation in the palm of the hand: that cattle, in general, will not eat it; yet that sometimes, when they are turned hungry into a new field of grass, or have but a small spot to range in, they will feed on it, and hence their mouths have become sore and blistered. According to Linnæus, sheep and goats eat it; but kine, horses, and swine refuse it. When made into hay it loses its acrid quality, but then it seems to be too stalky and hard to afford much nourishment: if it be of any use it must be to correct, by its warmth, the insipidity of the grasses. In many pastures the flowering stems are left standing in vast abundance to disseminate their seeds: before they do that, they might easily be cut down with the scythe, or pulled up by women and children after a shower, which would more effectually destroy the plants; they should be gathered into heaps and burnt. It flowers in June and July, and is confounded vulgarly with the repens and bulbosus, under the name of butter-flower or butter-cups, under a notion that the yellow color of butter is owing to these plants. It is the richness and exuberance of the pasture that communicates this color, and not these flowers, which the cattle seldom or ever touch. It is frequent in gardens with a double flower, among other herbaceous perennials, under the name of yellow bachelor's buttons.

R. aquatilis produces flowers which are sometimes very large, and make a handsome show in ponds and ditches: the curious variety in the floating and immersed leaves, occasioned by the depth and velocity of the stream, adds to the beauty of this common aquatic plant. Dr. Pulteney (*Linn. Trans.* vol. 5. p. 19.) contradicts the assertions of its deleterious qualities, and proves that it is not merely innoxious, but nutritive to cattle, and capable of being converted to useful purposes in agricultural economy. In the neighbourhood of Ringwood, on the borders of the Avon, some of the cottagers support their cows, and even horses, almost wholly by this plant. A man collects a quantity every morning, and brings it in a boat to the edge of the water, from which the cows eat it with great avidity, insomuch that they stint them, and allow only about twenty-five or thirty pounds to each cow daily. One man kept five cows and one horse so much on this plant with the little which the heath afforded, that they had not consumed more than half a ton of hay throughout the whole year, none being used except when the river is frozen over. Hogs also are fed with this plant, and improve so well on it, that it is not necessary to give them any other sustenance till they are put up to fatten. This property of water-crowfoot is the more remarkable, as all the species have been deemed acrimonious, and some of them are, without doubt, highly so. It is probable this species is rendered inert as a poison by growing in the water; although it must be confessed, that in other instances moisture heightens the deleterious property of vegetables, especially in the umbelliferous tribe.

8061 Leaves trifid silky, Lobes broad toothed cut, Stem and petiole with reflexed hairs, Grains hooked
8062 A small variety of R. hirsutus, with a dwarf 1-flowered stem
8063 Lvs. reniform 3-5-lobed with broad entire blunt lobes, Pet. scarcely longer than cal. Petals 5-12 [bristles
8064 The submersed lvs. capill. multifid : emersed 3-part. with cuneif. lobes tooth. at end, Grains hispid with stiff
8065 The submersed lvs. capillary multifid : emersed 3-part. with cuneif. lobes toothed at end, Grains smooth
8066 All the leaves capillary multifid, Pet. obovate larger than calyx, Grains smooth

8067 Leaves smooth : radical 3-parted ; cauline multifid with lin. lobes, Grains with long prickles on each side
8068 Lvs. vill. : radic. stalk. ov. 3-part. cut ; floral 3-part. Stem erect dichotom. with spread. hairs, Grains muric.
8069 Lvs. smooth stalk. bifid, Lobes oval obl. divaricat. : the mid. entire, Sheaths auricled at base, Stem filiform
8070 Radical leaves round with 5 cut lobes : cauline sessile palmate, Stem pubescent, Cal. subvillous
8071 Rad. lvs. trifid beyond midd. with cuneif. trifid lobes, Stem with spread. hairs, Grains hooked with style
8072 Lvs. smooth stalk. roundish 3-lob. coarsely tooth. Pedunc. opp. lvs. Cal. spreading, Grains muricate cornute
8073 Lvs. vill. round 3-lob. coarsely tooth. Stems soft decumb. Cal. reflexed as long as pet. Grains tuberculate

8074 Sepals 5-10 spreading, Pet. 10-15 shorter than stamens

8075 Sepals 15 globose, Pet. 5-10 the length of stamens
8076 Sepals 10 spreading, Pet. 10 longer than stamens

8077 Caps. 10-20, Sepals acute, Root slender nearly simple perpendicular
8078 Caps. 1-3, Sepals blunt, Root creeping grumous

8079 Sepals 6-8-oblong

8080 Radical leaves pedate smooth, Scape leafless with 1-2-fl. and bractes
8081 Radical leaves pedate smooth : cauline subsessile palmate, Sepals roundish ovate green
8082 Radical leaves palmate downy beneath, Segm. cuneate at base 3-5-lobed at end, Sepals roundish colored
8083 Radical leaves palmate downy beneath, Segm. obl. undivided serrate at end, Sepals ovate obl. acute green
8084 Radical leaves very smooth pedate : cauline subsessile palmate, Sepals roundish green
8085 Stem many-fl. leafy, Leaves pedate very smooth with obl, linear segments
8086 Stem many-fl. leafy, Leaves 3 cut smooth glaucous beneath, Segments ovate-lanceolate

8087 Leaves trifid with obovate toothed blunt 3-lobed segments, Scape 1-flowered

and Miscellaneous Particulars.

This remark of Dr. Pulteney's is the more important, as in the Swedish experiments the R. aquatilis is recorded as the only one rejected by all the species of domestic cattle ; of the common sorts, there is no doubt but that R. Flammula, bulbosus, acris, sceleratus, and arvensis are acrimonious. Before the introduction of Cantharides they were used as vesicatories, and are said to act with less pain than flies, without any effect on the urinary passages ; but their action is related to be uncertain, and they are accused of frequently leaving ill-conditioned ulcers.

The acrimony, even of the most virulent, is wholly dissipated in drying ; so that in form of hay they appear to be harmless. It is also expelled in decoction ; accordingly, the shepherds of Morlachia boil the R. sceleratus and eat it ; and both R. auricomus and repens are said to be wholly inoffensive, and are ranked by some authors among oleraceous plants.

The Ranunculi give out their acrimony wholly in distillation. The distilled water of R. sceleratus is intensely acrimonious ; and when cold deposits crystals, which are scarcely soluble in any menstruum, and are of an inflammable nature.

1234. *Trollius.* A name given to this plant by Conrad Gesner. It is derived from *trol* or *trolen*, an old German word, signifying something round, in allusion to the form of the flowers. The species are showy flowers for the general border, and of the easiest possible culture.

1235. *Isopyrum.* A name given by the Greeks to a plant resembling Nigella, the seeds of which had the same taste. These are small herbaceous plants related to Nigella, but with the habit of Thalictrum.

1236. *Eranthis.* From ἐρα, the earth, and ἀνθος, flower, because the bright yellow blossoms seem to lie upon the earth. A pretty little tuberous rooted plant, valuable for the early period at which it flowers.

1237. *Helleborus.* From ἑλειν, to cause death, and βορα, food. The dangerous qualities of Hellebore are well known. Leathery leaved plants, most of which are evergreen, and flower in winter and early in spring. H. niger and fœtidus have long been in use in popular medicine, especially the latter, as a vermifuge and cathartic. They are both admitted in the London Materia Medica, but being violent poisons, require caution in their application. H. fœtidus, from its deep green and finely divided leaves, forms a most ornamental evergreen bush for the shrubbery.

1238. *Coptis.* From κοπτω, to cut, in reference to the numerous divisions of the leaves. Small plants, with the habit of Trientalis.

History, Use, Propagation, Culture,

1239. *Caltha.* A syncope of καλαθος, a goblet, in allusion to the form of the corolla, which may be likened to a golden cup. The flower-buds of C. palustris, gathered before they expand, are said to be a good substitute for capers. The juice of the petals boiled with alum dyes paper yellow. The whole plant is acrid, and not eaten by cows, unless in case of extreme hunger.

Class XIV. — DIDYNAMIA. 4 Stamens, of which two are shorter than the others.

This class, which, as its name applies, depends upon the presence of four stamens in the corolla, two of them being longer than the others, is, with the exception of Syngenesia and Gynandria, the most natural and best defined of all Linnæus's great groups, or, as he named them, classes. It is divided into two orders, called Gymnospermia and Angiospermia.

Gymnospermia contains all the genera with what are popularly but erroneously called by the Linnæan school of botany, naked seeds. It answers to the natural order of Labiatæ of Jussieu's method, with the exception of some genera which are excluded on account of having only two stamens, and are found in Diandria. Nearly all the class consists of herbaceous plants, those which are called shrubs being for the most part herbaceous plants, whose stems, from the mildness of the climate in which they grow, become perennial. The most remarkable plants are the rosemary, hyssop, balm, thyme, mint, and marjoram, for the kitchen or laboratory; and the various species of Teucrium, Lavandula, Phlomis, and Dracocephalum, for the flower garden.

In Angiospermia are included the genera with numerous, or rarely a few, seeds, enclosed in a simple pericarpium. These would be combined in a manner not altogether unnatural, if some of the genera were excluded. For instance, the beautiful Linnæa, the emblem of the most highly gifted naturalist the world has ever produced, belongs to Caprifoliaceæ, and stands alone in point of natural affinity; the same may be said of Melianthus. The greater part of Scrophularineæ, all Melampyraceæ and Orobancheæ, and nearly the whole of Verbenaceæ and Gesnericæ are found here. A considerable portion of Acanthaceæ also occupy a station in this order. Among these are many genera of much beauty, but few of interest as useful plants. Among the ornamental families every one will recognize the Bignonia, with its elegant orange or yellow trumpet flowers, and frequently twining stem; the Jacaranda, with its fern-like umbrageous foliage and magnificent diadem of blue; the Acanthus, consecrated to sculpture; the noble Clerodendrum, the pride of the Japanese; and the modest Eyebrights (Euphrasia) of our English meadows. In one part of the class we have the Vervain, surrounded by its mystic moonlight charms; in another, the Antirrhinum tribe, remarkable for the grotesque resemblance of its blossoms to the snouts of animals; and close behind it, imperial Pedicularis, proudly rearing her heraldic honours among the snows and deserts of the frozen north. These are succeeded by a long line of forms, principally European, and of various degrees of beauty. Among the useful plants, Digitalis, used in medicine, and Sesamum as oil seed, are all which can be particularized.

Order 1. GYMNOSPERMIA.

Pericarpium divided into four lobes resembling naked seeds.

1242. *Ajuga.* Upper lip of cor. very minute, 2-toothed. Stamens longer than upper lip.

1243. *Anisomeles.* Calyx tubular, 10-striated, 5-cleft. Upper lip of corolla small, entire; lower trifid, with the middle segment 2-lobed. Stamens exserted, ascending. Anthers of the short stamens 2-celled, with close cells; of the longer halved or dissimilar. Seeds smooth.

1244. *Teucrium.* Upper lip of cor. none, 2-parted beyond the base. Stamens exserted.

1245. *Westringia.* Cal. campanulate, 5-toothed. Corolla subrotate, with the upper segment bifid. Two of the anthers barren.

1246. *Satureja.* Cal. tubular, striated. Segments of corolla nearly equal. Stamens distant.

8088 Stem creeping, Leaves triangular cordate serrate crenate
8089 Stem erect, Leaves cordate roundish crenate with round auricles

8090 An aquatic floating plant, covered all over with viscid slime, Roots fibrous

8091 The only species. A small plant with simple stems and a few 3-5-parted leaves

and Miscellaneous Particulars.

1240. *Hydropeltis.* From υδωρ, water, and πελτη, a buckler; that is to say, a water-plant, with a leaf like a round shield. A curious little floater, with the aspect of Hydrocharis.
1241. *Hydrastis.* From υδωρ, water, in reference to the humid places wherein it grows. The root of this plant is yellow, bitter, pungent, and tonical.

1247. *Thymbra.* Cal. subcylindrical, 2-lipped, with a villous furrowed line on each side. Segm. of cor. flat. Style half bifid.
1248. *Hyssopus.* Lower lip of cor. 3-parted, with the intermediate segm. subcrenate. Stamens straight, distant.
1249. *Nepeta.* Cal. dry, striated. Cor. with a longish tube; the middle segments of lower lip crenate. Orifice reflexed at edge. Stamens approximating.
1250. *Elsholtzia.* Cal. tubular, 5-toothed. Upper lip of corolla 4-toothed; lower longer, undivided, somewhat crenulate. Stamens distant.
1251. *Lavandula.* Cal. ovate, somewhat toothed, supported by a bractea. Corolla resupinate. Stamens within the tube.
1252. *Sideritis.* Cal. 5-fid. Cor. ringent or subregular: the upper lip bifid, lower 3-parted. Stamens within the tube. The short stigma wrapping over the other.
1253. *Bystropogon.* Cal. with 5 subulate teeth, closed at the orifice with hairs. Upper lip of cor. bifid; lower trifid. Stamens distant.
1254. *Mentha.* Cor. nearly equal, 4-fid, with the broadest segment emarginate. Stamens erect, distant.
1255. *Perilla.* Cal. with the upper segment very short. Stamens distant. Styles 2, united.
1256. *Hyptis.* Cal. 5-toothed, increasing in size. Corolla ringent: the upper lip bifid; the lower 3-parted, with the intermediate segment shaped like a little bag. Stamens inserted in the swollen part of the tube, and declinate.
1257. *Horminum.* Cal. 2-lipped, awned, smooth in the orifice; when past flower, having its upper teeth crossing each other. Upper lip of corolla 2-lobed; lower 3-lobed, with nearly equal segments. Leaves radical. Scape nearly naked.
1258. *Glechoma.* Cal. 5-fid. Each pair of anthers forming by their union the figure of a cross.
1259. *Lamium.* Upper lip of corolla entire, vaulted; lower 2-lobed; the orifice toothed at the edge on both sides.
1260. *Galeopsis.* Upper lip of corolla somewhat crenate, vaulted; lower 2-toothed above.
1261. *Galeobdolon.* Cal. 5-fid, unequal, awned. Upper lip of corolla vaulted, entire; lower trifid, with acute segments. Anthers smooth.
1262. *Betonica.* Calyx awned. Upper lip of cor. ascending, flattish. Tube cylindrical.
1263. *Stachys.* Upper lip of cor. vaulted; lower reflexed at edges, intermediate larger and emarginate. Stamens after flowering reflexed towards the sides.
1264. *Zietenia.* Cal. 5-parted, with subulate very long equal segments. Segments of lower lip of cor. reflexed; intermediate folded together and emarginate. Stamens after flowering reflexed towards the sides. Grain one.
1265. *Ballota.* Cal. hypocrateriform, 5-toothed, 10-lined. Upper lip of cor. crenate concave. Grains ovate 3-cornered.
1266. *Marrubium.* Cal. hypocrateriform, rigid, 10 lined. Upper lip of cor. bifid, linear, straight.
1267. *Leonurus.* Cal. 5-angled, 5-toothed. Upper lip of cor. villous, flat, entire; lower 3-parted, with the middle segment undivided. Anthers covered, with shining spots.
1268. *Phlomis.* Calyx 5-angled, 5-toothed. Helmet compressed, keeled, emarginate. Seeds bearded at end.
1269. *Leucas.* Cal. tubular, 10-striated, 8-10-toothed, with an orifice, either equal or oblique. Corolla ringent. Helmet concave, entire, bearded: lower lip 3-fid, with the middle segment largest. Anthers twin, beardless, with divaricating lobes. Stigma 2-lipped, with the upper segment very short.
1270. *Leonotis.* Differs from the last in having an elongated helmet, and the lower lip small and withering: the middle segment scarcely larger than the others.
1271. *Moluccella.* Cal. campanulate, enlarged, wider than corolla, spiny.
1272. *Clinopodium.* Invol. of many bristles beneath the whorl. Corolla 2-lipped. Upper lip of corolla flat, obcordate, straight.

1273. *Pycnanthemum.* Involucre of many bractes beneath the little heads. Cal. tubular, striated. Upper lip of corolla nearly entire; lower trifid. Stamens nearly equal.
1274. *Origanum.* Cone 4-cornered, spiked, collecting the calyxes. Upper lip of corolla erect, flat; lower 3-parted, with nearly equal segments.
1275. *Thymus.* Orifice of bilabiate calyx closed with hairs. Upper limb of corolla flat, emarginate.
1276. *Acynos.* Cal. 2-lipped, furrowed, hispid, gibbous at base, villous at orifice. Cor. ringent, inflated at orifice, with the upper lip erect, emarginate; the lower 3-parted, spreading: intermediate segm. concave. All the stamens fertile.
1277. *Calamintha.* Cal. after flowering closed by hairs. Orifice of cor. inflated. Upper lip emarginate; lower 3-parted, with the intermediate segment entire, subemarginate or crenulate.
1278. *Melissa.* Cal. dry, flattish above, with the upper lip somewhat fastigiate. Upper lip of cor. somewhat vaulted, 2-fid: lower less, with middle lobe cordate.
1279. *Dracocephalum.* Cor. inflated at orifice, with the upper lip concave.
1280. *Melittis.* Cal. smooth, campanulate, blunt, oblique at orifice. Upper lip of cor. flat; lower crenate. Anthers cruciate.
1281. *Ocymum.* Cal. with the upper lip orbicular; lower 4-fid. Corolla resupinate, with one lip 4-cleft, the other undivided. Exterior filaments having a process at their base.
1282. *Plectranthus.* Upper lip of cal. largest. Corolla resupinate, ringent, with the tube gibbous upwards, or spurred.
1283. *Trichostema.* Upper lip of cor. falcate, Stamens very long.
1284. *Prostanthera.* Calyx 2-lipped, in fruit closed. Tube striated, lips undivided, blunt. Corolla ringent, with a half bifid helmet: middle segment of lower lip large, 2-lobed. Anthers spurred beneath.
1285. *Scutellaria.* Cal. entire, after flowering closed with a lid. Tube of the corolla elongated.
1286. *Prunella.* Upper lip of calyx dilated. Filaments forked, upon one point bearing their anthers. Stigma bifid.
1287. *Cleonia.* Filaments forked, upon one point bearing their anthers. Stigma bifid.
1288. *Prasium.* Cal. campanulate, 2-lipped. Upper lip of cor. vaulted; lower trifid, with the middle segm. largest cordate. Grains berried.
1289. *Phryma.* Cal. 2-lipped, 5-toothed. Grain only one.

Order 2. ANGIOSPERMIA.  Seeds several, enclosed in an undivided pericarpium.

I. *Ovary inferior, or nearly inferior.*

1290. *Gesneria.* Cal. 5-fid. Corolla incurved and recurved. Capsule 2-celled.
1291. *Gloxinia.* Cal. 5-leaved. Cor. campanulate, with an oblique limb. Filaments with the rudiment of a fifth inserted upon the receptacle.
1292. *Linnæa.* Cal. double: of the fruit 2-leaved; of the flower 5-parted. Cor. campanulate. Berry dry, 3-celled.

II. *Ovary superior, polypetalous.*

1293. *Melianthus.* Cal. 5-leaved, with the lower leaflet gibbous. Petals 4, with the nectary below the lowest. Capsule 4-celled.

III. *Ovary superior, monopetalous.*

A. *Filaments 5, the upper only rudimentary.*

1294. *Bignonia.* Cal. 5-fid, cup-shaped. Cor. campanulate, 5-fid, ventricose beneath. Pod 2-celled. Seeds with membranous wings.
1295. *Jacaranda.* Cal. 5-toothed. Cor. tubular at base, with a dilated throat, and a 5-lobed unequal limb. Fifth filament sterile, long, villous at end. Stigma with two lips. Capsule large, round, woody, with the edge dividing into two valves.
1296. *Sesamum.* Cal. 5-parted. Cor. campanulate 5-fid, with the lower lobe largest. Stigma lanceolate Capsule 2-celled, the cells divided in two by the inflexed edges of the valves.
1297. *Pentstemon.* Cal. 5-leaved. Cor. 2-lipped, ventricose. Fifth filament longer than the rest, and bearded at its upper end. Capsule compressed, 2-celled, 2-valved. Seeds numerous, subglobose.
1298. *Chelone.* Cal. 5-parted, with two bractes. Cor. ringent, ventricose. Fifth filament shorter than the others. Caps. 2-celled, 2-valved. Seeds numerous, with a membranous edge.
1299. *Tourretia.* Cal. 2-lipped. Corolla ringent: the upper lip galeate, large; lower 2-toothed, very small. Nectary annular, 4-lobed. Stigma truncate. Capsule 4-celled. Dissepiments with 4 wings. Seeds cordate.
1300. *Martynia.* Cal. 5-fid. Cor. ringent. Capsule woody, coated, with a hooked beak, 4-celled, 2-valved.

B. *Filaments 4. Capsule many-seeded, opening with elasticity. Seeds large, flat.*

* *Calyx bifid.*

1301. *Acanthus.* Cal. 4-parted: the two lateral inner segments short; the two outer long, with 3 bractes, of which the middle one is toothed, spiny. Cor. labiate, having the orifice closed with hairs. Lower lip very large, 3-lobed. Anthers villous. Stigma bifid. Caps. ovate, with 1-2-seeded cells.

** *Calyx 4-fid.*

1302. *Barleria.* Cal. 4-parted. Stamens 2, much smaller than the others. Capsule with 4 angles, 2-celled, 2-valved, elastic, without claws. Seeds 2.

*** *Calyx 5-fid.*

1303. *Phaylopsis.* Calyx unequal, with a large dorsal segment. Cells of the ovary 2-seeded, with the segments of the dissepiment spontaneously dividing in two. Otherwise like Blechum.
1304. *Ruellia.* Cal. 5-parted, generally with two bractes. Corolla campanulate, with a 5-lobed limb. Stamens in pairs. Capsule narrowed to each end. Teeth opening elastically. Seeds not many.
1305. *Blechum.* Cal. 5-parted, equal. Cor. funnel-shaped. Capsule about 2-celled, 2-valved: the segments of the crosswise dissepiment finally becoming loose. Seeds many, with hooks.
1306. *Aphelandra.* Cal. 5-parted, unequal. Cal. 2-lipped. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise. Seeds with hooks.
1307. *Crossandra.* Cal. 5-parted, unequal. Cor. 1-lipped. Stamens included. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise. Seeds with hooks.

**** *Calyx multifid.*

1308. *Thunbergia.* Cal. double: outer 2-leaved; inner about 12-toothed. Cor. campanulate. Capsule beaked, 2-celled.

C. *Filaments 4. Capsule, drupa, or berry few seeded. Seeds erect.*

* *Calyx bifid.*

1309. *Hebenstreitia.* Cal. spathaceous, opening lengthwise beneath. Cor. tubular, unequal, with one upper 4-fid lip. Stamens projecting from the lower cleft of the corolla. Caps. 2-seeded.

** *Calyx 4-fid.*

1310. *Hosta.* Cal. obsoletely 2-lipped, 4-toothed. Corolla ringent, with the middle segment of the lower lip large, emarginate. Drupe with a 4-celled, 4-seeded nut.
1311. *Gmelina.* Cal. about 4-toothed. Cor. 4-fid, campanulate. Two of the anthers 2-parted, 2-simple. Drupe baccate. Putamen bony, 4-celled. Cells 1-seeded, the lower sterile.
1312. *Lantana.* Flowers capitate. Cal. obsoletely 4-toothed. Limb of corolla 4-fid, with an open orifice. Stigma hooked backwards. Drupes heaped, with a 2-celled smooth nut.
1313. *Aloysia.* Calyx deeply 4-cleft. Corolla tubular, 4-lobed. Stigma emarginate. Stamens 4, perfect. Seeds two.
1314. *Lippia.* Flowers capitate. Cal. 4-toothed, roundish, erect, compressed, membranous. Corolla 4-fid, funnel-shaped. Drupe dry, 1-seeded, thin, covered by the calyx. Nuts two, 1-seeded.
1315. *Melampyrum.* Capsule 2-celled. Seeds 2, gibbous, polished.

*** *Calyx 5-fid.*

1316. *Selago.* Cal. 5-fid. Tube of corolla filiform. Limb nearly equal. Capsule simple or 2-lobed, each lobe with a seed.
1317. *Vitex.* Cal. 5-toothed. Limb of cor. 5-6-fid. Drupe 1-seeded, with a 4-celled nut.
1318. *Cornutia.* Cal. 5-toothed. Stamens longer than corolla. Style very long. Berry 1-seeded.
1319. *Zapania.* Flowers capitate. Cal. 5-toothed. Cor. 6-fid. Stigma peltate, capitate, oblique. Fruit covered, bladdery, enclosing two seeds.
1320. *Priva.* Cal. inflated, 5-toothed. Cor. a little longer than the tube of calyx, contracted at orifice. Drupe covered by the calyx. Nuts two, 2-celled, 2-seeded. Stamens 2-4.
1321. *Spielmannia.* Cal. 5-fid. Limb of cor. 5-fid, the orifice closed by hairs. Stigma hooked. Drupe with a 2-celled warted nut.
1322. *Verbena.* Cal. 5-fid. Cor. funnel-shaped, with an incurved tube, and an unequal 5-fid limb. Stamens 4, fertile. Fruit bladdery, covered, withering. Seeds 4.
1323. *Avicennia.* Cal. 5-parted. Cor. 2-lipped: the upper lip square. Caps. coriaceous, rhomboid, 1-seeded. Seed germinating within the capsule.
1324. *Caldasia.* Cal. tubular, 5-toothed. Cor. hypocrateriform, nearly equal. Filaments inserted in top of tube. Caps. 3-celled, 3-seeded, 3-valved. Seeds elliptical.
1325. *Clerodendrum.* Cal. 5-fid, campanulate. Corolla with a filiform tube and a 5-parted equal limb. Stamens very long, projecting from between the segments of corolla. Drupe 4-seeded, with a 1-celled nut.
1326. *Volkameria.* Cal. 5-fid. Cor. with 1-sided segments. Drupe 2-seeded. Nuts 2-celled, with 1-seeded cells.
1327. *Holmskioldia.* Cal. colored, very large, campanulate, spreading, with a nearly entire limb a little shorter than the ringent corolla.
1328. *Petræa.* Cal. 5-parted, very large, colored. Corolla rotate. Caps. 2-celled, 2-seeded in the bottom of the calyx. Seeds solitary.
1329. *Citharexylum.* Cal. 5-toothed, campanulate. Corolla funnel-shaped, rotate. Segments villous, above equal. Drupe 2-seeded. Nuts 2-celled.
1330. *Duranta.* Cal. 5-fid, superior. Drupe 4-seeded, covered by the calyx. Nut 4-2-celled, 2-seeded.
1331. *Pedalium.* Cal. 5-parted. Cor. tubular, ringent, with a 5-cleft limb. Filaments hairy at base. Anthers in pairs, forming a cross. Nut corky, with spiny angles. Seeds 2, with an arillus.
1332. *Myoporum.* Cal. 5-parted. Corolla campanulate, with a spreading nearly equal 5-parted limb. Drupe 1-2-seeded, with 2-celled nuts.
1333. *Stenochilus.* Cal. 5-parted. Cor. ringent: the upper lip erect, half 4-cleft: lower undivided, narrow, deflexed. Stamens didynamous, exserted. Ovary 4-celled, with 1-seeded cells. Stigma blunt, undivided. Drupe berried, 4-celled. Seeds solitary.
1334. *Bontia.* Cal. 5-parted. Cor. 2-lipped, with an oblong tube: the lower lip 3-parted, revolute. Drupe ovate, 1-seeded, oblique at end.

D. *Filaments 4. Capsule or berry many-seeded. Seeds small, attached to a central receptacle.*

* *Calyx bifid.*

1335. *Orobanche.* Cal. of 2-lobed lateral leaflets. Corolla ringent. Capsule 1-celled, 2-valved, many-seeded. Gland at the base of the ovary.
1336. *Crescentia.* Cal. 2-parted, equal. Corolla gibbous. Berry stalked, 1-celled, many-seeded. Seeds immersed in pulp.
1337. *Castilleija.* Cal. spathaceous; the upper lip bifid, lower none. Cor. 2-lipped: the lower lip very short, trifid, with 2 glands between the segments. Caps. 2-celled.

** *Calyx trifid.*

1338. *Halleria.* Cal. 3 or 5-leaved. Cor. 4-fid, somewhat inflated. Berry 2-celled, many-seeded

*** *Calyx 4-fid.*

1339. *Lathræa.* Cal. 4-fid. A depressed gland at the base of the suture of the ovary. Capsule 1-celled.
1340. *Rhinanthus.* Cal. 4-fid, ventricose. Cor. ringent, with the upper lip generally compressed. Capsule 2-celled, blunt, compressed.
1341. *Bartsia.* Cal. 4-lobed, emarginate, colored. Cor. smaller than the calyx: the upper lip longest. Capsule 2-celled. Seeds angular.
1342. *Euphrasia.* Cal. cylindrical, 4-fid. Corolla 2-lipped: the upper lip bifid; the lower 3-lobed, with bifid lobes. Lower anthers with spiny lobes.

**** *Calyx 5-fid.*

1343. *Antirrhinum.* Cal. 5-leaved. Cor. not spurred, gibbous at base: the upper lip bifid, reflexed; lower trifid, closed by the prominent palate. Caps. oblique at base, without valves, opening at the end by three pores.
1344. *Linaria.* Cal. 5-parted, with the two lower segments remote. Cor. spurred, ringent: the orifice closed by the prominent palate. Caps. ovate 2-valved, opening at the end into 3-5-segments.
1345. *Anarrhinum.* Cal. 5-leaved. Cor. prominent at base, honey bearing: lower lip flat, without a prominent palate. Caps 2-celled, many-valved.
1346. *Nemesia.* Cal. 5-parted. Cor. spurred, with a prominent palate. Caps. compressed, truncate, opening lengthwise in the middle, 2-celled, 2-valved. Seeds numerous, linear.
1347. *Maurandya.* Cal. 5-parted. Cor. campanulate, unequal. Filaments callous at base. Caps. 2, united, half 5-valved at end.
1348. *Gerardia.* Cal. 5-fid. Cor. 2-lipped, the lower lip 3-parted, with emarginate lobes: the middle 2-parted. Capsule 3-celled, splitting.
1349. *Pedicularis.* Cal. 5-fid. Cor. ringent. Capsule 2-celled, mucronate, oblique. Seeds truncated. Leaves multifid.
1350. *Erinus.* Cal. 5-leaved. Cor. with a 5-fid, equal limb. Lobes emarginate: the upper lip very short, reflexed. Caps. 2-celled.
1351. *Mimulus.* Cal. prismatical, 5-toothed. Cor. ringent, with the upper lip folded back at the sides. Stigma thick. Capsule 2-celled, many-seeded.

1352. *Hornemannia.* Cal. tubular, 5-toothed, plaited. Cor. with the upper lip emarginate: lower 3-lobed. Seeds minute, scurfy.
1353. *Mazus.* Cal. large, campanulate, spreading. Cor. ringent, with a pimpled throat. Anthers connected. Stigma spatulate. Caps. 2-celled, many-seeded.
1354. *Isoplexis.* Like Digitalis, but corolla campanulate, with the upper segment as long as the lip, and incumbent upon it before expansion.
1355. *Digitalis.* Cal. 5-parted. Corolla campanulate, ventricose, 5-fid. Capsule ovate 2-celled.
1356. *Scrophularia.* Cal. 5-fid. Cor. subglobose, resupinate. Caps. 2-celled.
1357. *Vandellia.* Cal. 4-fid. Cor. ringent. Two outer filaments from the disk of the lip of cor. Anthers united in pairs. Caps. 1-celled, many-seeded.
1358. *Sibthorpia.* Cal. 5-parted. Cor. 5-parted, equal. Stamens in remote pairs. Caps. orbicular, compressed, 2-celled, with a transverse dissepiment.
1359. *Limosella.* Cal. 5-fid. Cor. 5-fid, equal. Stamens approximating in pairs. Caps. 1-celled, 2-valved, many-seeded.
1360. *Browallia.* Cal. 5-toothed. Cor. closed by the prominent orifice. Two of the anthers larger than the others. Caps. 1-celled.
1361. *Stemodia.* Cal. 5-parted. Cor. 2-lipped. Stamens 4: each filament bifid, and bearing two anthers. Capsule 2-celled.
1362. *Trevirana.* Cal. 5-leaved. Cor. declinate funnel-shaped. Limb flat, 5-parted, nearly equal. Caps. half 2-celled.
1363. *Columnea.* Cal. 5-parted, spreading. Corolla ringent: the upper lip 3-parted, with the intermediate segment arched, above the base gibbous. Capsule berried, 1-2-celled.
1364. *Russelia.* Cal. 5-leaved. Cor. 2-lipped, with a hairy throat: upper lip broader, emarginate, lower trifid, with linear segments. Stigma globose Caps. 1-celled, 2-valved, many seeded.
1365. *Dodartia.* Cal. campanulate, angular, 5-toothed. Lower lip of cor. broad, 3-fid. Stigma bifid. Caps. globose, 2-celled, covered by the calyx.

History, Use, Propagation, Culture,

1242. *Ajuga.* Said to be an alteration of *abigo*, to expel or drive away. The Latins attributed emmenagogue qualities to a plant called *ajuga*, which is believed to be our Teucrium chamæpitys. Handsome flowering plants. A. reptans is vulgarly reputed vulnerary, cooling, and gently astringent. It is commonly called *bugle*, which appears to be a corruption of *bugula*, a contracted diminutive of *buglossum*, which the plant resembles in medical qualities.
1243. *Anisomeles.* So named by Mr. Brown, from ἀ, privative, ἰσος, equal, and μελος, a member. Tropical downy herbaceous plants. Their leaves are crenated, flowers grow in whorls supported by minute bracteæ; the calyxes are glandular, and the corolla of all the species purple.
1244. *Teucrium.* Teucer, the Trojan prince, is said by Pliny to have been the first to employ this plant

1366. *Lindernia.* Cal. 5-parted. Cor. ringent: upper lip very short. Two lower stamens with a terminal tooth and lateral anther. Capsule 1-celled.
1367. *Herpestis.* Cal. 5-parted, unequal: 2 inner sepals smaller, covered by the others. Cor. tubular, somewhat 2-lipped. Stamens included. Lobes of anthers spreading. Stigma emarginate.
1368. *Capraria.* Cal. 5-parted. Cor. campanulate, 5-fid, acute. Caps. 2-valved, 2-celled, many-seeded.
1369. *Buchnera.* Cal. absolutely 5-toothed. Limb of corolla 5-fid, equal, with cordate lobes. Capsule 2-celled.
1370. *Manulea.* Cal. 5-parted. Cor. funnel-shaped. Limb 5-parted, with subulate segments; the four upper large, connected. Caps. 2-celled, many-seeded.
1371. *Angelonia.* Cal. 5-parted, nearly equal. Cor. irregular, spreading, 2-lipped, with a short tube, and arched orifice: upper lip 2-parted; lower much larger, 3-parted, with the middle segment slipper-shaped at base.
1372. *Schizanthus.* Cor. irregular: the upper lip 5-fid; lower 3-parted. Two filaments sterile. Capsule 2-celled.
1373. *Besleria.* Cal. 5-parted. Cor. tubular, gibbous on each side, with a 5-lobed unequal limb. Berry roundish, 1-celled, many-seeded. Seeds nidulant.
1374. *Teedia.* Cal. 5-parted. Cor. hypocrateriform, 5-fid, blunt. Style short, persistent. Berry 2-celled, many-seeded.
1375. *Brunsfelsia.* Cal. 5-toothed, small. Tube of cor. very long, with a flat 5-lobed limb. Capsule berried, 1-celled, many-seeded, with a very large receptacle.
1376. *Celsia.* Cal. 5-parted. Cor. rotate. Filaments bearded. Capsule 2-celled.
1377. *Alonsoa.* Cal. 5-parted. Cor. subrotate, resupinate, 5-fid, with the upper segment largest. Stamens declinate. Filaments smooth. Anthers approximating, similar. Capsule 2-celled.
1378. *Anthocercis.* Cal. 5-fid. Cor. campanulate, regular. Rudiment of a 5th filament. Stigma capitate. Caps. 2-celled, 2-valved, many-seeded. The inflexed edges of valves inserted in the placenta.

***** *Calyx multifid.*

1379. *Cymbaria.* Cal. 10-toothed. Upper lip of cor. bifid, lower trifid. Capsule cordate, 2-celled.

GYMNOSPERMIA.

8092 Leaves ovate, Cor. pubescent resupinate
8093 Four-cornered pyramidal villous, Radical leaves very large
8094 Stem simple, Cauline leaves as long as radical leaves
8095 Radical leaves smaller than cauline leaves
8096 Stolones creeping

8097 Leaves trifid, Fl. axillary solitary shorter than leaf, Stem diffuse
8098 Leaves linear toothed forwards, Flowers axillary solitary
8099 Leaves stalked subcordate ovate acuminate acutely crenate hairy, Thyrses axillary stalked

8100 Bractes filiform, Leaves lanceolate entire downwards
8101 Leaves ovate subcordate crenate, Whorls many-fl. Bractes linear, Calyx hairy, Glands inconspicuous

8102 Leaves multifid, Flowers lateral solitary
8103 Leaves multifid linear, Raceme compound, Pedicels short
8104 Leaves multifid, Whorls halved
8105 Leaves trifid or 5-fid filiform, Flower stalked solitary opposite, Stem decumbent
8106 Leaves lanceolate trifid, Pedunc. axillary 3-flowered
8107 Leaves lanceolate entire white beneath, Flowers solitary
8108 Leaves entire rhomboid acute villous downy beneath, Flowers solitary
8109 Leaves quite entire ovate acute stalked downy beneath, Flowers racemose one-sided
8110 Leaves oval toothed forwards, floral entire stalked, Whorls racemose, Stem much branched
8111 Leaves ovate toothed forwards, floral entire sessile, Whorls racemose, Stems branched

and Miscellaneous Particulars.

medicinally. Under-shrubs or herbs of little beauty; but several of them aromatic. The leaves and younger branches of T. marum (*Mar*, Arabic, signifying bitter), when recent, on being rubbed between the fingers, emit a volatile aromatic smell, which readily excites sneezing, but to the taste they are bitterish, accompanied with a sensation of heat and acrimony. Cats are very fond of these plants, and where there are few will destroy them.

T. scorodonia (*σκοροδον*, garlic, the smell of which this plant possesses) in Jersey is used as a substitute for hops, and the beer is said sooner to become clear than when hops are made use of. Withering found on trial that it gave too much color to the liquor.

T. scordium, also from *σκοροδον*, garlic, was once in high esteem for destroying worms and for fomentations.

History, Use, Propagation, Culture,

Sheep and goats are said to eat this plant: horses, cows, and swine to refuse it. If cows, compelled by hunger, eat it, their milk gets a garlic flavor.

T. chamædrys, is said to have cured Charles V. of the gout, by a vinous decoction taken for sixty successive days. It is commonly called Germander, which seems to be a corruption of the word Chamædrys, for the French call it *germandrée*, an evident alteration of *gamandré*, under which name it first appeared in the very rare Herbier de Mayence, printed in 1485.

1245. *Westringia.* Named by Sir J. E. Smith, in honor of Dr. John Peter Westring, physician to the king of Sweden, and author of several learned papers on the Lichen tribe. A genus of New Holland plants, chiefly from the colder parts of that country, and having the appearance of our Rosemary.

8112 Leaves ovate-oblong villous nearly entire, Flowers axillary solitary sessile
8113 Leaves ovate serrate smooth, Pedunc. sol. 3-flowered : intermediate sessile, Bractes linear lanceolate
8114 Leaves lanceolate repand-serrate rectangular at base, Fl. racemose one-sided, Calyx 2-lipped
8115 Leaves lanceolate crenate rugose, Flower racemose one-sided, Calyx 2-lipped
8116 Leaves ovate serrate, Raceme spiked round sessile terminal
8117 Leaves cuneate serrate cut smooth narrowed into the stalk, Flower solitary stalked
8118 Leaves ovate-lanceolate serrate hoary beneath, Stem erect round terminal, Whorls 6-leaved
8119 Leaves ovate unequally serrate, Racemes terminal, Bractes shorter than flower-stalk
8120 Leaves oblong acuminate unequally serrate pubescent, Spikes sessile terminal, Cal. inflated villous
8121 Leaves cordate oblong obtuse, Stem brachiate dichotomous, Spikes very long terminal sessile spiral
8122 Leaves cordate toothed acuminate, Racemes lateral nodding
8123 Leaves cordate subpubescent toothed stalked, Racemes axillary one-sided, Stem erect herbaceous
8124 Leaves lanceolate crenate tomentose hoary beneath, Racemes terminal, Flower stem brachiate
8125 Leaves cuneiform lanc. serrated villous, Racemes axillary and terminal, Cor. resupinate
8126 Leaves ovate rugose cut crenate hoary, Stems erect, Racemes straight one-sided
8127 Leaves oblong sessile toothed nearly naked, Fl. axillary stalked in pairs, Stem diffuse pubescent
8128 Leaves cuneiform ovate cut crenate stalked, Fl. ternary, Stems procumbent somewhat hairy
8129 Leaves elliptical crenate, Fl. lateral solitary, Lip of cor. woolly outside, Leaves various in form
8130 Leaves ovate cut serrate smooth, Whorls halved, Stems erect smooth
8131 Leaves ovate crenate : floral entire, Whorls halved racemose, Stem bearded in two rows
8132 Corymbs terminal, Cal. with acute unarmed teeth, Leaves lanceolate entire downy beneath
8133 Corymbs terminal, Cal. with acute mucronate teeth, Lvs. linear entire revolute at edge downy beneath
8134 Heads terminal few-flowered, Leaves stalked ovate blunt downy beneath, Stem procumbent
8135 Corymbs terminal, Leaves cuneiform orbicular crenate hairy
8136 Corymbs terminal hairy, Leaves ovate serrate and stems densely woolly at the ends yellow and shining
8137 Heads roundish stalked, Leaves lanceolate blunt crenate revolute at edge downy, Stem decumbent
8138 Heads roundish, and leaves, which are linear lanceolate crenate forwards, tomentose yellow at end
8139 Fl. solitary clustered, Leaves linear revolute crenate, Calyxes woolly
8140 Heads roundish lax, Leaves lanceolate crenate forwards downy hoary, Stem woolly corymbose
8141 Heads stalked, Leaves lanceolate crenate tomentose, Stem erect
8142 Heads roundish, Leaves linear revolute crenate forwards close and stem densely woolly
8143 Heads terminal sessile, Leaves linear revol. at edge packed in four close rows, Stem procumbent downy
8144 Spiny, Upper lip of calyx ovate, Corolla resupinate, Peduncles twin
8145 Leaves entire ovate acute stalked revolute at edge pubescent downy beneath, Fl. racemose

8146 Leaves beneath and calyxes silvery, Teeth half as long again as tube
8147 Leaves beneath and calyxes ash-colored opaque, Teeth half as short as tube

8148 Whorls fastigiate, Leaves linear lanceolate rough
8149 Lvs. acute revolute at edge pubescent, Pedunc. axillary many-fl. Bractes much shorter than calyx
8150 Whorls roundish hispid, Leaves obovate oblong acuminate veinless dotted hispid
8151 Pedunc. axillary 3-6-flowered, Bractes shorter than calyx, Leaves ovate hispid veiny beneath
8152 Pedunc. axillary cymose one-sided, Sepals acuminate mucronate, Leaves lin. lanc. entire mucronate
8153 Stem erect branched with spreading hairs, Upper leaves hairy acute, Ped. 1-flowered axillary
8154 Ped. axill. cymose one-sided, Sepals blunt unarmed, Lvs. roundish ovate atten. at base toothed bluntish
8155 Pedunc. axillary cymose, Leaves lanceolate entire, Stem brachiate
8156 Flowers spiked, Leaves keeled dotted ciliated
8157 Fl. axillary 3 subsessile, Bractes linear, Leaves oblong entire attenuate at base smooth hispid beneath

8158 Flowers spiked, Bractes heaped linear ciliate
8159 Flowers whorled, Leaves linear lanceolate entire

8160 Fl. whorled racemose 1-sided, Middle lobe of cor. 2-lobed entire, Leaves lanceolate, Teeth of calyx erect
8161 Fl. whorled racemose 1-sided, Midd. lobe of cor. 2-lobed entire, Lvs. lin. lanc. Teeth of cal. spreading uneq.
8162 Pedunc. axillary cymose, Cor. resupinate, Middle lobe crenate, Leaves oblong cordate toothed [tooth.
8163 Spikes whorled cylind. Midd. lobe of cor. crenate, Style shorter than cor. Lvs. subcord. ov. acum. sharply
8164 Spikes whorl. cylind. Midd. lobe of cor. crenate, Style longer than cor. Lvs. cord.-ov. acum. bluntly tooth.

and Miscellaneous Particulars.

1246. *Satureja.* The Arabs call all labiate plants by the collective name of *ss'atar*, according to Bochart. Forskahl says, they call the wild Thyme *ss'atar*. S. montana and hortensis have been cultivated as culinary aromatics from time immemorial, and much more formerly than now, when almost all European species are superseded by those of the East Indies.

1247. *Thymbra.* A name of uncertain origin. The ancients gave it to a plant analogous to Thyme. Possibly it may have been so called after the name of a place. Thymbræa, a town in Lydia, was the spot where the famous battle was fought between Cyrus and Crœsus, in which the fate of the latter was decided.

1248. *Hyssopus.* Latinized from the Hebrew name *ezob*. The Arabic name *azzof*, is evidently the same.

History, Use, Propagation, Culture,

Vide John de Souza, p. 106. The plant to which this name was given is involved in uncertainty. It appears to have been one of the smallest plants, whence some have inferred that "the Hyssop which groweth out of the wall" is a kind of moss. H. officinalis, a neat little evergeen tuft, and most ornamental and fragrant when in flower, was once in considerable repute as a popular medicine, but is now almost out of use.

1249. *Nepeta.* Said by Linnæus to be derived from *Nepet*, a town of Tuscany, mentioned by Pliny. N. cataria is called catmint, because cats are very fond of it, especially when it is withered, when they will roll themselves on it, tear it to pieces, and chew it with great pleasure. Ray observes, that plants which he transplanted from the fields into his garden were always destroyed by the cats, unless he protected them with thorns till they had taken good root and came into flower; but that they never meddled with plants raised from seed. Miller has confirmed this by his own experience; having frequently set a plant from another part of the garden within two feet of others which came up from seeds, when the former was torn in pieces and destroyed by the cats, whilst the latter remained unhurt. The true reason of this difference is assigned by Ray; that the cat is fond of it in a languid withering state, or when the peculiar scent of the plant is excited by being handled or bruised in gathering or transplanting. Hence the English vulgar saying,

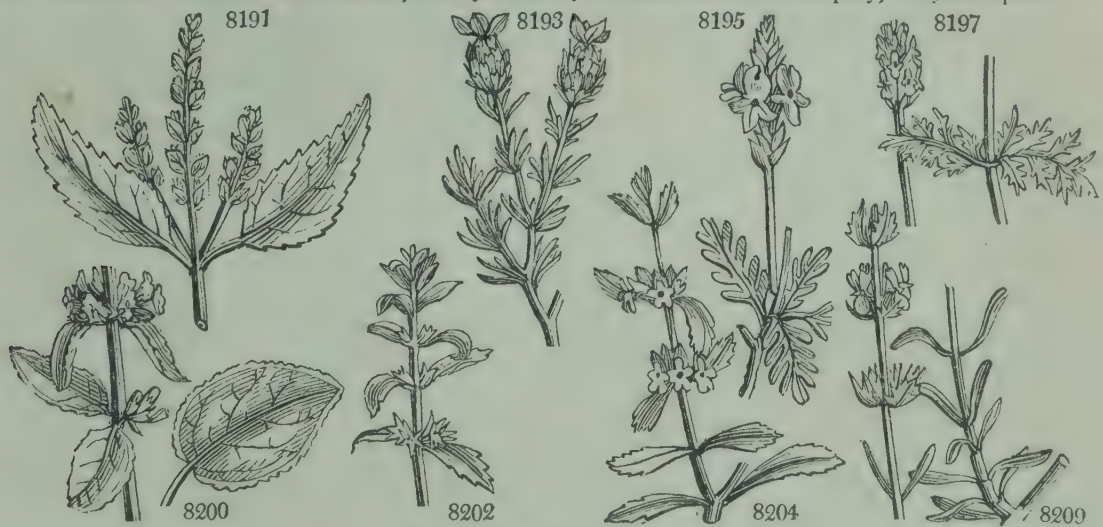
8165 Flowers spiked, Whorls somewhat stalked, Leaves stalked cordate tooth-serrated
8166 Corymbs stalked spiked, Leaves lanceolate rugose tomentose bluntly serrated
8167 Spike whorled interrupted, Leaves cordate toothed rugose waved crisp stalked hoary
8168 Cymes stalked many-flowered, Leaves lanceolate oblong cordate naked, Lateral lobes of cor. reflexed
8169 Cymes stalked many-fl. hairy, Lvs. oblong cordate villous subsessile, Lateral lobes of cor. reflexed
8170 Cymes stalked many-fl. pilose, Leaves cordate stalked naked subsessile, Lateral lobes of cor. spreading
8171 Cymes remote stalked 1-sided few-fl. Lvs. cordate blunt crenate glandular beneath : floral all sessile
8172 Cymes stalk. 1-sid : lower rem. Lvs. cord. blunt cren. rug. downy without glands : floral generally stalked
8173 Cymes stalked many-flowered, Leaves stalked oblong subcordate crenate downy
8174 Flowers panicled, Leaves lanceolate serrate sessile naked
8175 Cymes stalked, Leaves cordate oblong lanceolate deeply serrate downy
8176 Leaves cordate oblong serrated, Bractes linear, Whorls 8-12-flowered incurved nearly 1-sided
8177 Racemes whorled naked, Leaves cordate oblong sessile naked
8178 Flowers sessile in whorled spikes, Bractes lan. longer than calyx pubesc. Leaves stalked villous beneath
8179 Cymes stalked racemose, Leaves obl. cordate serrate beneath hoary and rugose with veins
8180 Leaves cordate oblong crenate stalked, Stem smooth angular, Flowers whorled capitate clustered
8181 Fl. sessile in whorled spikes, Bractes lin. the length of calyx, Leaves stalked
8182 Fl. sessile in whorled spikes, Whorls distant capitate, Bractes lanc. length of cal. Leaves stalked entire
8183 Leaves sessile lanceolate in approximated whorls, Bractes ovate with netted veins [at end
8184 Cymes stalked many-fl. Tube of cor. filiform curved, Leaves ovate cordate blunt stalked serr. pubescent
8185 Cymes stalked few-fl. racemose, Leaves ovate cordate blunt stalked toothed pubescent
8186 Spikes term. Bractes obl. acum. nerved with colored lines, Lvs. cord. pubesc. Lateral lobes of cor. reflexed
8187 Spikes term, Bractes ov. nerved rugose subscariose, Lvs. obl. cord. villous, Lateral lobes of cor. spreading
8188 Flowers spiked, Leaves pinnatifid entire
8189 Flowers spiked, Lateral lobes of cor. spreading, Leaves pinnatifid with lin. nearly equal segments

8190 Stems prostrate, Leaves ovate subserrate, Spikes terminal, Calyx scarious at end
8191 Spikes solitary unilateral erect, Bractes veiny

8192 Leaves sessile lin. lanc. revolute at edge, Spike interrupted naked

8193 Leaves sessile lin. downy revolute at edge, Spike contracted comose subsessile, Bractes 3-lobed
8194 Leaves sessile lin. rugose villous revolute at edge, Spike comose, Bractes undivided
8195 Leaves sessile linear pectinate-pinnate, Spike contracted comose
8196 Lvs. stalked pinnate, Leaflets cuneate, Spike imbricated
8197 Lvs. stalked hoary, Leafl. pinnatifid crosswise, Spike simple 4-corn. spiral, Bractes ovate nerved villous
8198 Lvs. stalked pinnate nearly smooth, Leafl. pinnatifid crosswise, Spike branched interrupted 4-cornered
8199 Lvs. stalked ovate cordate serrate fleshy, Spike 4-cornered, Calyxes recurved

8200 Shrubby villous, Lvs. cordate oblong acute stalked, Spikes whorled before flowering nodding
8201 Shrubby downy, Lvs. ovate lanc. cordate narrowed at end white beneath, Whorls about 8-fl. remote
8202 Herbaceous without bractes, Cal. larger than cor. spiny, Upper lip trifid
8203 Herbaceous without bractes villous, Stem diffuse, Segm. of calyx nearly equal spiny
8204 Herbaceous decumbent without bractes, Leaves spatulate toothed at end, Cal. spiny, Upper lip ovate
8205 Half-shrubby woolly, Leaves lanc. nearly entire, Fl. in whorled spikes, Bractes cordate acute downy
8206 Half-shrubby downy, Lvs. lanc. cren. Fl. in whorled spikes, Bractes cord. acum. reticulated with nerves
8207 Herbac. pilose-hispid, Upper lvs. lanc. amplexicaul. toothletted, Bractes cord. acum netted hairy at edge
8208 Half-shrubby downy, Lvs. linear lanceolate nearly entire, Flowers and bractes toothed
8209 Hirsute, Lvs. lanc. spiny toothed, Bractes round. cord. shorter than cal. with spiny teeth, Whorls distant
8210 Hirsute, Lvs. lanc. spiny toothed, Bractes cord. acum. longer than cal. with spiny teeth, Whorls close
8211 Lvs. lanc. smooth entire, Bractes cord. toothed-spiny, Calyxes equal
8212 Leaves lanc. toothed smooth above, downy beneath, Bractes ovate toothed spiny, Calyxes equal



and Miscellaneous Particulars.

" *If you set it*
The cats will eat it ;
If you sow it
The cats will not know it."

1250 *Elsholtzia.* Named by Willdenow, in memory of a Prussian botanist, John Sigismund Elsholtz, who lived in the middle of the seventeenth century. Inconspicuous hardy herbaceous plants of little merit.

1251. *Lavandula.* From *lavare*, to wash. The use of the distilled water of this plant is well known. The flowers of L. spica have an agreeable fragrant odour, and warm bitterish taste. Alcohol extracts their virtues completely, and elevates in distillation all their odorous parts ; water acts less completely. The oil, however, on which their virtues depend, is obtained separate in distillation with water ; in the proportion, according to Lewis, of one ounce of oil from sixty ounces of the flowers. Lavender is stimulant and tonic. The oil extracted by alcohol enters into several compositions. The dried leaves in powder were used formerly as a sternutatory ; but they are now neglected. The flowers are cut in dry weather, when they begin to blow. (*London Dispensatory*, 862.)

1252. *Sideritis.* From σιδηρος, iron. A name given by the Greeks to a plant by which were cured all

History, Use, Propagation, Culture,

wounds by sword. The plants of the moderns do not possess any such properties. Their flowers, however, have frequently a ferruginous color.

1253. *Bystropogon.* A name elegantly contrived by L'Heritier, from βυω, to close, and πωγων, a beard, in allusion to the throat of the corolla being closed by hairs.

1254. *Mentha.* Μινθα or μινθη, in old Greek. The poets feign that Mintha was a daughter of Cocytus, transformed into the plant which bears her name; an allegorical description of the terrible effects ascribed to their plant by the ancients. M. viridis not being so hot to the taste as peppermint, and having a more agreeable flavor than most of the others, is generally preferred for culinary and some medicinal purposes. The leaves or tops are used in spring salads, and eaten dried as sauce with lamb and in soups.

The medical preparations of spearmint are more pleasant than those of peppermint, but perhaps less efficacious. This herb, as do the other sorts, contains much essential oil, but of an odor less agreeable than that of lavender or marjoram: it is therefore less employed as a cephalic; but it acts very powerfully on parts to which it is immediately applied, and therefore considerably on the stomach. It acts especially as an antispasmodic, and therefore relieves pains and cholic arising from spasm. It will also stop vomiting dependent on the same cause; but if it arise from an inflammatory irritation in the stomach itself, or in other parts of the body, it aggravates the disease. The infusion of mint in warm water agrees better with the stomach than the distilled water. The officinal preparations are an essential oil, a conserve, a simple water, and a spirit. The conserve is very grateful, and the distilled waters both simple and spirituous, are generally thought pleasant.

8213 Leaves lanc. toothed blunt pilose, Bractes toothed spiny, Stems hirsute decumbent
8214 Hirsute, Lvs. obl. cuneate toothed wavy downy beneath, Bractes round with spiny teeth, Whorls distant
8215 Shrubby downy, Lvs. cord. obl. crenate stalked downy on each side, Upper lip of cor. ovate entire
8216 Like hyssopifolia, but leaves smooth on each side somewhat toothed lanceolate blunt

8217 Panicle dichotomous, Cal. feathery, Leaves ovate subserrate downy beneath
8218 Panicle dichotomous, Cal. feathery, Leaves ovate entire very white beneath
8219 Panicle dichotomous, Flowers capitate, Leaves ovate crenate most villous beneath
8220 Panicle dichotomous, Flowers capitate, Leaves ovate toothed smooth dotted

8221 Spikes oblong, Leaves oblong serrated hairy sessile, Stamens longer than cor.
8222 Spikes cylindr. interrupted, Leaves ovate-obl. subsessile remotely serrate and calyxes smooth
8223 Hoary, Spikes oblong interrupted, Leaves roundish rugose crenate sessile

8224 Spikes obl. Leaves sessile oval finely and equally serrate acum. hoary beneath, Stamens as long as cor.
8225 Spikes obl. Lvs. ovate stalked serr. hoary beneath, Calyxes and peduncles hirsute, Stem much branched
8226 Leaves stalked subcordate slightly pubescent, Spikes middle sized [somewhat hairy
8227 Spikes cylindr. interrupted, Lvs. lanc. subsess. cun. at base finely serrated smth. on each side, Teeth of cal.
8228 Spks. obl. Lvs. obl. comp. blunt. serrat. ses. hoary and downy on each side, Cal. and ped. vill. Stem much br.
8229 Spikes obl. blunt interrupted at base, Lvs. ov.-obl. acute serrat. stalked smooth, Cal. quite smooth at base
8230 Flowers racemose whorled, Leaves stalked ovate lanc. serrated smooth
8231 Spikes capitate, Leaves cordate cut-toothed wavy sessile, Stamens length of corolla [hirsute
8232 Spikes cylindr. interrupt. Lvs. ov.obl. subsess. cuspid. ser.waved complicate hoary on each side, Cal. and ped.
8233 Spikes cylindr. Lvs. ovate obl. subsess. cuspidate serr. wavy complicate hoary on each side
8234 Flowers in heads, Lvs. ellipt. blunt serrated smooth stalked, Stamens shorter than corolla
[at base
8235 Spikes cylindr. interrupted, Lvs. ovate lanc. stalked finely serr. entire at base, Ped. hirsute, Cal. smooth
8236 Spikes obl. interrupt. at base, Lvs. obl. lanc. subses. remotely and finely serrat. entire at base hoary beneath
8237 Spikes cylindr. contracted, Leaves obl. subcor. subses. equally serrated hoary beneath, Cal. and ped. hirsute
8238 Spks. cylindr. interrupt. at base, Lvs. ov. obl. subsess. finely and unequally serr. hoary, Cal. and ped. hirsute
8239 Spikes cylindr. interrupted, Lvs. ovate-ellipt. rounded at end serrated subsessile hoary beneath
[calyx villous
8240 Spks. cylindr. interrupt. at base, Lvs. lin. lanc. nearly entire complicate sess. hoary on each side, Ped. and
8241 Flowers whorled, Lvs. ovate stalked serrated entire at base smooth, Teeth of calyx hairy
8242 Fls. whorl. Lvs. ov.-lanc. narrowed at each end, Cal. tubular obl. hairy, Hairs of pedicels spreading, of stems
8243 Low pubesc. Fl. whorled, Lvs. stalked with resinous dots acute at each end, Stamens exserted [deflexed
8244 Flowers capitate or whorled, Lvs. stalked ovate, Calyx hairy on each side, Pedicels hispid backwards
8245 Whorls spiked oblong, Leaves lanceolate entire downy
8246 Fl. whorled, Lvs. ovate stalked serrate hairy, Cal. hairy, Ped. smooth, Stem erect
8247 Flowers whorled, Lvs. ovate acutish serrated, Stamens longer than corolla
8248 Spikes cylindr. interrupted at base, Lvs. ovate stalked serrate beneath hairy, Cal. and peduncle hirsute
8249 Flowers whorled, Lvs. lanc. subsess. Stem much branched erect, Cal. at base and pedicels very smooth
8250 Flowers whorled, Lvs. ovate stalked serrate hairy, Cal. and peduncles hirsute, Stem much branched

8251 Flowers whorled, Lvs. ovate, Stem much branched spreading, Calyxes and pedicels smooth at base
8252 Flowers whorled, Lvs. lanc. serrate stalked hairy, Stam. as long as corolla
8253 Flowers whorled, Lvs. ov. subsess. cuspidate serr. wavy nearly smooth, Pedunc. and calyx smooth at base
8254 Flowers whorled, Lvs. ovate, Stem prostrate, Pedicels and cal. downy on each side, Teeth ciliated
8255 Flowers whorled, Lvs. lanc. nearly entire sessile smooth, Bractes palmate

and Miscellaneous Particulars.

Lewis observes, that mint is said to prevent the coagulation of milk; and hence it has been recommended to be used with milk diets, and even in cataplasms and fomentations for resolving coagulated milk in the breasts: upon experiment, the curd of milk, digested in a strong infusion of mint, could not be perceived to be any otherwise affected than by common water; but milk, in which mint leaves were set to macerate, did not coagulate near so soon as an equal quantity of the same milk kept by itself. Dry mint digested in rectified spirits of wine, gives out a tincture which appears by day-light of a fine dark green, but by candle-light of a bright red color. The fact is, that a small quantity of this tincture is green, either by day-light or candle-light, but a large quantity seems impervious to common day-light; however, when held between the eye and a candle, or between the eye and the sun, it appears red; so that if put into a flat bottle it appears green, but when viewed edgewise red.

For medicinal use spearmint is generally cut just as the flowers appear; but for obtaining the essential oil, the flowering plant is preferred. It should be cut in very dry weather. (*London Dispensatory*, 384.)

M. piperita has a more penetrating smell than any of the other species, and a much stronger taste, pungent and glowing like pepper, sinking as it where into the tongue, and followed by a sensation of coldness. Its stomachic, anti-spasmodic and carminative qualities render it useful in flatulent colics, hysterical affections, retchings, and other dyspeptic symptoms, acting as a cordial, and often producing immediate relief. The officinal preparations are an essential oil, a simple water, and a spirit. The essence of peppermint is an elegant medicine, and seems to be the rectified oil dissolved in spirits of wine.

"The cultivators of the plant observe, that to keep up its quality, the roots must be transplanted every three

History, Use, Propagation, Culture,

years, otherwise it degenerates into the flavor of spearmint." (*Linnean Transactions*, v. 176.) If the plant be cut in wet weather it changes to black, and is little worth. (*London Dispensatory*, 385.)

M. pulegium (from *pulex*, a louse, which animal it was thought to drive away) smells like spearmint, but less fragrant; the taste aromatic and pungent, with a slight flavor of camphor. These qualities reside in a very volatile essential oil, which rises in distillation with water. It was formerly regarded as emmenagogue, expectorant, and diaphoretic, and was in repute for promoting the uterine evacuation, and relieving hysteria, hooping-cough, asthma; but it is now justly considered of no value, and seldom used in regular practice. (*London Dispensatory*, 386.)

1255. *Perilla.* A name the meaning of which has not been explained. An annual plant with a strong balmy fragrance.

1256. *Hyptis.* From ὑπτιος, reversed, because the corolla seems inverted, both as to its form and as to the insertion of stamens. Plants with densely whorled flowers, all natives of the western parts of the world, within, or nearly so, the limits of the tropics.

1257. *Horminum.* From ὁρμαω, to excite, in allusion to its stimulant qualities. The Horminum of the ancients was reputed aphrodisiac.

1258. *Glechoma.* Γληχων was a sort of Thyme among the Greeks. Small trailing herbs. The leaves of G. hederacea are often deformed with red hairy tumours, which are the galls of the Cynips Glechomæ. Before

8256 Leaves ovate serrate, Bractes long leafy

8257 Heads stalked in an involucre, Invol. lanc. the length of flowers, Leaves ovate toothed
8258 Heads stalked in an involucre, Invol. lanc. longer than flowers, Leaves oblong toothed narrowed at base
8259 Heads opp. few-fl. without bractes, Pedunc. shorter than joints, Leaves cord. doubly serrate; upper oval
8260 Flowers in spiked 1-sided panicles on a two-parted peduncle, Leaves ovate
8261 Flowers in stalked capitate cymes, Leaves of invol. 2 longer than calyx in fruit, Leaves oblong
8262 Leaves ovate subcordate attenuate acutely crenate pubesc. spiked whorled terminal, Cal. 5-toothed
8263 Flowers capitate, Invol. filiform hispid shorter than calyx of fruit, Lower leaves cordate
8264 Heads on a short peduncle, Leaves of invol. oblong lanc. Cal. pubescent not closed with hairs

8265 Stem leafy, Leaves ovate oblong crenate, Bractes cordate, acuminate, Cal. pungent

8266 Smooth, Segment of calyx ovate acute
8267 Hirsute, Segment of calyx lanceolate cuspidate

8268 Leaves cord. unequally finely serr. Orifice of cor. inflated, Lower lip 3-toothed on each side, Cal. colored
8269 Leaves cord. rugose, Stem smooth, Cal. smooth the length of tube of corolla
8270 Leaves cord. acute rugose and stems hairy, Whorls many-flowered, Tooth of orifice solitary setaceous
8271 Leaves cord. concave somewhat hoary, Orifice of cor. inflated, Tube straight with two teeth on each side
8272 Leaves cord. acuminate, Whorls 10-flowered
8273 Leaves cord. acuminate serrate stalked, Whorls 20-flowered
8274 Smooth, Leaves cordate crenate: floral subsessile, Teeth of calyx as long as cor.
8275 Leaves stalked somewhat toothed: lower cordate; upper ovate
8276 Leaves stalked cordate blunt toothed; upper close together, Stem naked below
β Leaves cut-toothed
8277 Floral leaves sessile amplexicaul cut; radical lobed
8278 Leaves many-parted

8279 Joints of stem equal, All the whorls remote, Leaves lanceolate
8280 Joints of stem equal, Leaves ovate lanceolate serrate villous, Helmet crenate cut
8281 Joints of stem thickened upwards, Upper whorls contiguous, Cal. pungent, Cor. little longer than calyx
8282 Stem hispid, Joints thickened upwards, Cor. thrice as long as calyx, Helmet ventricose

8283 All the leaves ovate, Involucre 4-leaved

8284 Spike interrupted, Helmet entire, Middle segm. of lower lip emarg. Cal. smoothish
8285 Spike oblong, Helmet entire, Middle segm. of lower lip crenate wavy, Cal. hairy, Bractes ciliated
8286 Spike interrupted, Helmet bifid, Middle segm. of lower lip crenate, Tube downy incurved
8287 Spike entire, Middle segm. of lower lip entire
8288 Spike leafy at base, Helmet bifid
8289 Spike leafy at base, Helmet entire
8290 Spike leafy interrupted, Calyx villous at edge, Teeth subulate, Helmet obcordate

and Miscellaneous Particulars.

the use of hops, the leaves were put in ale, and being bitter, aromatic, and having a peculiar and very strong smell, were much used in popular medicine. It is now, however, seldom used.

1259. *Lamium.* *Lamia* was a celebrated marine monster; the flowers of this genus have a considerable resemblance to the grotesque figure of some beast. L. orvala is the only species admitted into the garden. The others are mostly ugly weeds. L. album, *Ortie blanche*, Fr., *Taube Nessel*, Ger., and *Ortica morta* or *bianca*, Ital., has a disagreeable smell when bruised, and though no cattle whatever will touch it, yet Linnæus says, the leaves are eaten in Sweden as a pot herb in spring.

1260. *Galeopsis.* From γαλη, a weasel, and ὀψις, appearance. The flower has a grotesque figure, and may be likened to the form of a weasel, or, indeed, of any thing else.

1261. *Galeobdolon.* A word with the same meaning as Galeopsis, which see.

1262. *Betonica.* In Celtic botany is called *Bentonic;* wherefore it appears, that Pliny gave too much way to conjecture, when he wrote that Betonica or Vetonica was so called from the Vetones, a people who dwelt at the foot of the Pyrenees. B. officinalis was formerly much used in medicine, but it is discarded from modern practice. When fresh it intoxicates. The leaves when dry excite sneezing. Sheep eat it, but goats refuse it. The roots are bitter and very nauseous; in a small dose they vomit and purge violently. This plant dyes wool of a very fine dark yellow color.

History, Use, Propagation, Culture,

1263. *Stachys.* From σταχυς, a spike; the flowers of all the species grow in spikes. They are for the most part strong smelling weeds.

1264. *Zietenia.* A genus divided by Gleditsch from Stachys, on account of the different structure of the corolla, and the single grain. It is a plant with lanceolate entire lineate leaves, the lower of which are connate, and purple blossoms.

8291 Whorls 6-flowered, Leaves cordate stalked
8292 Leaves ovate obl. acum. serrated hairy above with soft down beneath, Segm. of cal. linear mucronate
8293 Whorls spiked 6-fl. Tube of cal. shorter than spread. teeth, Helm. of cor. emarg. Lvs. ov. serr. with soft down
8294 Small, Stems much branched diffuse, Leaves cordate crenate, Cal. campanulate spiny
8295 Whorls about 6-flowered, Leaves linear lanceolate ½ stem-clasping sessile
8296 Whorls 6-flowered, Leaves ovate cordate crenate, Petioles dilated
8297 Leaves cordate cren. pubescent, Whorls 4-6-flowered, Stem erect smooth simple
8298 Whorls many-fl. approximated, Bractes filiform, Leaves cordate toothed, Stem decumbent villous
8299 Hoary, Whorls many-fl. Leaves ovate, Serratures imbricated, Stem woolly
8300 Whorls many-fl. Calyxes subpungent, Leaves oblong subcordate crenate, Stem woolly
8301 Whorls many-fl. Leaves woolly oblong, Stems procumbent at base and rooting
8302 Whorls 10-fl. Calyxes unarmed, Leaves cordate: floral ovate entire sessile, Stem hairy
8303 Whorls 6-fl. Leaves oblong cordate stalked, Stem hollow
8304 Whorls 2-fl. Leaves linear naked; lower pinnatifid-toothed
8305 Like S. germanica, but downy not woolly, Leaves narrower, Calyxes long spiny
8306 Whorls many-fl. Leaves cordate thin, Serratures cartilaginous at end, Lips of cor. flat
8307 Whorls spiked 6-flowered, Bractes cordate, Leaves cordate stalked blunt crenate toothed
8308 Leaves ovate crenate pubescent: upper entire, Whorls 6-fl. Cal. hairy with filiform segments
8309 Whorls spiked, Lvs. oblong attenuated at base serrated hairy: lower blunt, Cal. mucronate spiny
8310 Erect pubescent, Leaves cord. ov. toothed: above smooth; beneath white with down, Whorls about 6-fl.
8311 Whorls a little spiked hairy 6-fl. Cal. spiny, Leaves oblong serrate blunt, Helmet bifid
8312 Hairy, Whorls 30-flowered, Calyx pungent, Stem hairy
8313 Smooth much branched, Branches spiny, Pedunc. axillary solitary 1-fl. with two bractes
8314 Hoary, Branches brachiate terminated by a spine, Flowers axillary in threes
8315 Leaves downy ovate lanceolate: floral shorter than the whorl
8316 Whorls 6-flowered, Radical leaves oval crenate: upper ovate entire, Cor. twice as long as calyx
8317 Leaves obliquely cordate rugose crenate blunt hairy, Bractes entire shorter than calyx
8318 Leaves cordate ellipt. the lower on long stalks, Stems and spinulose calyxes covered with wool
8319 Whorls 2-flowered, Leaves cordate deeply serrated rugose, Tube of cor. curved
8320 Whorls 6-flowered, Stems prostrate, Upper lip of cor. bifid spreading reflexed, Lvs. broad cord. crenate
8321 Hoary, Whorls 6-fl. Leaves linear lanceolate narrowed at base downy rugose serrated, Calyxes pointless
8322 Whorls 6-fl. Calyxes rather pungent, Lvs. cuneate lanceolate blunt serrate at end sessile, Stem decum.
8323 Whorls subspiked, Leaves cordate ellipt. crenate rough, Stems ascending
8324 Whorls 6-fl. Leaves ovate lanc. rugose 3-nerved stalked, Stem erect
8325 Small, Whorls 6-fl. Leaves blunt nearly naked, Corolla the length of calyx, Stem weak
8326 Whorls many-fl. spiked, Upper lip bifid, with acute divisions, Leaves broad cordate rugose hairy
8327 Whorls 8-flowered, Leaves lanceolate cordate crenate rugose, Stem very hairy

8328 Whorls 6-flowered very hairy, Leaves lanceolate entire lined

8329 Leaves cordate undivided serrated, Cal. acuminate
8330 Leaves cordate undivided serrated, Cal. subtruncate
8331 Leaves palmate toothed, Stem woolly

8332 Leaves whorled halved 2-parted half-spiked

8333 Leaves cuneiform 5-toothed plaited, Whorls without involucrum
8334 Leaves elliptical obtuse crenate downy rugose, Calyxes and bractes lanceolate
8335 Leaves oblong hoary rugose toothed; the teeth towards the end largest, Cal. with small subulate teeth
8336 Leaves lanceolate hoary rugose toothed at end, Cal. with setaceous teeth, Stem branched divaricating
8337 Leaves ovate hoary bluntly toothed rugose, Cal. with subulate teeth, Stem branched at base
8338 Leaves roundish subcordate crenate rugose, Cal. with straight villous setaceous teeth
8339 Leaves cordate roundish emarginate crenate, Calyx 10-toothed spiny
8340 Leaves roundish ovate toothed rugose, Teeth of calyx 10 setaceous hooked
8341 Leaves cordate crenate downy green above, Teeth of calyx mucronate recurved
8342 Leaves cordate ovate crenate, Teeth of cal. 10 spreading lanceolate, Bractes subulate
8343 Leaves roundish cordate unequally crenate, Limb of calyx spreading, Teeth ovate mucronate
8344 Leaves cordate roundish, crenate somewhat toothed, Teeth of calyx 10 unarmed
8345 Leaves ovate greenish deeply crenate, Teeth of calyx subulate smooth spreading
8346 Leaves cordate ovate crenate, Limb of calyx spreading, Teeth ovate mucronate, Bractes oblong
8347 Hoary, Limb of calyx flat villous, Leaves cordate concave, Stem shrubby
8348 Limb of calyx longer than tube membranous, Larger angles rounded

and Miscellaneous Particulars.

1265. *Ballota.* So named on account of its offensive odor, from βαλλω, to reject.

1266. *Marrubium.* According to Linnæus is derived from an ancient town of Italy called *Maria-urbs*, situated on the borders of the Fucine lake. M. vulgare dried, has an aromatic odor, which, however, is soon lost by keeping, and a bitter taste. Both water and alcohol extract its virtues. It is tonic, diuretic, and laxative; was formerly much used in pulmonary affections, and is still a popular remedy for asthma and obsti-

History, Use, Propagation, Culture,

nate coughs. It loosens the belly when taken in large doses, and was consequently recommended in jaundice, cachexies, menstrual obstructions, and hysteria; but its powers are not found by modern practitioners equal to the account ancients gave of them, and therefore it is very seldom prescribed. (*London Dispensatory*, 379.)

1267. *Leonurus.* From λεων, a lion, and ουρα, tail. The spikes of flowers have been compared to the tuft which grows on the end of the lion's tail. L. Cardiaca was formerly used in medicine, but is now neglected. Tall herbaceous plants with cut leaves and whorls of flowers, of which the corolla is woolly.

1268. *Phlomis.* Φλομος was the Greek name of the Mullein, and so called from φλοξ, fire, because the thick cottony leaves were used as wicks for lamps. At this day, P. Lychnitis is so called, because the dried leaves, which are cottony and russet colored, are used in Spain for wicks. Fine shewy small shrubs or herbaceous plants, with corolla covered with down, and usually of a brownish yellow color.

1269. *Leucas.* A name used by Burmann, neglected by Linnæus and others, and restored by Mr. Brown; derived from λευκος, white, in reference to the usual color of the flowers, which are covered all over with a thick covering of wool.

1270 *Leonotis* From λεων, a lion, and ους, an ear. A fanciful name applied to the fine scarlet-flowering

8349 Leaves cordate 3-lobed or 5-lobed cut toothed wavy, Cor. larger than pungent calyx
8350 Leaves cuneiform ovate 3-lobed toothed, Cor. larger than pungent calyx, Middle lobe of lower lip acute
8351 Leaves 3-parted cut, Calyxes villous
8352 Leaves 3-parted multifid linear somewhat blunt
8353 Lvs. obl. toothed, Cor. scarcely longer than somewhat pungent calyx, Middle lobe of lower lip roundish
8354 Leaves about 5-lobed, Lobes blunt toothed at end, Cal. sessile spiny

8355 Leaves oblong blunt rugose and branches downy; floral ovate-lanceolate, Bractes ovate acuminate
8356 Leaves elliptical blunt woolly rugose, Branches woolly, Bractes obovate twice as short as calyx
8357 Bractes lanceolate acute pungent. Cal. 5-cornered acuminate, Leaves densely woolly beneath
8358 Bractes lanceolate blunt unarmed, Cal. truncated pointless, Leaves woolly on each side
8359 Lvs. downy on each side: rad. cord. sagitt.; cauline obl. Whorls without bractes, Cal. with obl. acute teeth
8360 Leaves lanceolate downy: floral ovate, Bractes setaceous woolly length of bluntly toothed calyx
8361 Stem hairy, Lvs. cordate crenate downy beneath, Bractes 3-parted subulate mucronate as long as calyx
8362 Lvs. ovate obl. serrate hairy beneath, Teeth of calyx lanc. subulate erect, Bractes subul. and stem hairy
8363 Radical leaves cordate pubescent; floral lanceolate, Bractes linear subulate villous, Stem pubescent
8364 Radical leaves cordate rough; floral oblong lanceolate, Bractes subulate hispid, Stem smooth
8365 Leaves alternately pinnate, Leaflets laciniate, Calyx woolly
8366 Leaves stalked obl. lanc. serr. at end, rough above downy beneath, Teeth of calyx subulate spreading
8367 Leaves cordate crenate downy beneath, Bractes ovate-lanceolate mucronate
8368 Like P. fruticosa, but the lower leaves are cordate stalked, Upper ovate

8369 Leaves lanceolate serrate, Heads terminal, Calyxes with 8 teeth
8370 Leaves obl. toothed pubes. beneath, Whorls many-fl. globose, Cal. incurv. 8-toothed, upper tooth longest
8371 Leaves ovate serrated hoary, Invol. subulate, Cal. obliquely truncate membranous 9-toothed
8372 Invol. linear, Cal. 1-lipped oblique, Leaves ovate hairy
8373 Lvs. lanc. smooth serrated at end, Stem 4-cornered rough, Whorls many-fl. Lip of cor. undivided

8374 Leaves cordate acute serrated somewhat downy, Calyx 7-toothed awned; upper tooth largest
8375 Leaves lanceolate serrate, Calyxes 10-cornered 10-toothed unarmed
8376 Leaves small ovate blunt somewhat downy crenate, Cal. 7-toothed awned
8377 Leaves stalked ovate cordate acuminate cut-toothed, Cal. velvety 10-toothed

8378 Cal. 2-lipp. upper lip lanc. mucron. longest, lower round. 7-tooth. Teeth spiny, Lvs. stalk. ov. deeply tooth.
8379 Cal. campanulate 5-toothed, Teeth equal pointless, Leaves stalked roundish ovate toothed
8380 Cal. funnel-shaped 5-toothed: teeth equal mucronate, Leaves sessile wedge-shaped oblong toothed

8381 Heads whorled, Bractes setaceous hispid, Leaves hairy above remotely toothed, Stem simple
8382 Heads terminal, Bractes setaceous hispid, Leaves smooth above nearly entire

8383 Leaves oblong-ovate acute subserrate hoary, Heads compound, Bractes setaceous, Stamens exserted
8384 Leaves lanceolate ovate subserrate on short stalks somewhat hoary, Heads sessile, Bractes awned
8385 Stem much branched rather rough, Leaves linear 3-nerved entire, Heads terminal fascicled

8386 Stem much branched roughish, Lv. lin. lanceolate veiny entire, Heads terminal fascicled corymbose

8387 Leaves concave downy, Spikes naked
8388 Lower leaves downy, Spikes nodding
8389 Leaves all smooth, Spikes nodding
8390 Spikes 4-cornered, Bractes roundish very large
8391 Spikes aggregate long prismatical upright, Bractes membranous twice as long as calyx

and Miscellaneous Particulars.

plants, known at the Cape by the name of lion's tail. They require a good greenhouse and plenty of air to secure their appearing in perfection. In places badly ventilated their leaves acquire a yellow color, and are apt to fall off.

1271. *Moluccella.* Brought from the Moluccas. Plants remarkable for the enlarged calyx in which the flower is seated.

1272. *Clinopodium.* From κλινη, bed, and πους, a foot. The tufted close whorls of flowers have been compared to the caster of a bed's foot.

1273. *Pycnanthemum.* From πυκνος, dense, and ανθος, a flower. The blossoms are in a close head. A North American genus of plants, some of which, as P. verticillatum and incanum, are occasionally seen in gardens.

1274. *Origanum.* From ορος, a mountain, and γανος, joy. These plants, with their pretty spikes of bracteated flowers and agreeable perfume, may indeed be called the joy of the places where they grow naturally. O. vulgare is an aromatic and ornamental plant, growing wild in thickets and hedges, chiefly in a calcareous soil. The dried leaves used instead of tea, are said to be exceeding grateful; they are also used in fomentations: the essential oil is so acrid, that it may be considered as a caustic, and is much used with that intention by

History, Use, Propagation, Culture,

farriers; a little cotton moistened with it, and put into the hollow of an aching tooth, frequently relieves the pain. The country people use the tops to dye woollen cloth purple. It also dyes linen of a reddish brown color. For this purpose the linen is first macerated in alum water and dried; it is then soaked for two days in a decoction of the bark of the crab-tree; it is then wrung out of this, boiled in a ley of ashes, and then suffered to boil in the decoction. According to the Swedish experiments, goats and sheep eat it, horses are not fond of it, and kine refuse it.

O. onites and marjorana are culinary aromatics; the latter being principally in use under the name of knotted marjoram, from the flower coming in whorls at the joints. O. vulgare and marjorana are both retained in the Materia Medica as tonics and stomachics, though scarcely ever used. In quack medicine, the leaves dried and powdered form an ingredient in cephalic snuff. Marjorana is so called from *marjamic* (*máryamych*), its Arabic name, according to Forskahl, p. 59.

1275. *Thymus.* From θυμος, courage, on account of its balsamic smell, which revives the spirits of animals. T. serpyllum, from ερπω, to creep, is fragrant, and yields an essential oil that is very heating. It has the same sensible qualities as garden thyme, but the flavor is milder, and rather more grateful. Its essential oil is both smaller in quantity and less acrid, and its spirituous extract comes greatly short of the penetrating warmth and pungency of the other. It is a common notion that the flesh of sheep that feed upon aromatic plants, particularly wild thyme, is superior in flavor to other mutton. The truth is, that sheep do not crop

8392 Leaves ovate acute serrated, Spikes clustered in umbels
8393 Spikes on long stalks aggregate, Bractes the length of calyx
8394 Spikes roundish panicled clustered, Bractes longer than calyx ovate colored
8395 Spikes oblong aggregate hairy, Leaves cordate downy
8396 Leaves stalked ovate pubesc. Spikes clustered prismatical, Bractes imbricate ovate smooth ciliated at edge
8397 Leaves stalked ovate acute subserrate hairy, Spikes prismatical, Bractes dense ovate acute
8398 Leaves subsessile ovate acute subserrate hairy, Spikes oblong bluntish
8399 Spikes roundish thin compact stalked, Leaves stalked ellipt. blunt smoothish
8400 Spikes roundish several clustered stalked, Leaves stalked ellipt. blunt downy

8401 Flowers capitate, Stems decumbent, Leaves flat blunt ciliated at base
8402 Flowers capitate, Stems creeping hairy, Leaves blunt villous
8403 Leaves ovate smooth with the smell of common balm
8404 Flowers capitate, Stems procumbent, Leaves cuneate linear ciliated at base
8405 Erect, Leaves revolute ovate, Flowers in whorled spikes
8406 Leaves oblong more ciliated than in T. serpyllum, Cor. with a more obscure spot in the orifice
8407 Stem shrubby, Flowers in whorled spikes, Lvs. linear lanc. bluntish flat about 3-nerved ciliated at base
8408 Erect, Leaves revolute linear-lanc. hairy, Head few-flowered axillary stalked
8409 Flowers capitate, Stems creeping, Leaves linear nerved and furrowed beneath, Bractes ovate
8410 Fl. whorled somew. spiked, Ped. 1-fl. Stem shrubby erect, Lvs. ellipt. entire acute smooth shining above
8411 Flowers in whorled spikes, Cal. woolly with very long setaceous segments
8412 Flowers in whorled spikes, Spikes oblique, Ped. 1-fl. Lvs. ov. obtuse very entire and calyxes nearly naked
8413 Flowers in whorled heads, Stems filiform, Leaves roundish flat hairy nerved ciliate at base
8414 Flowers in whorled spikes, Cal. woolly with setaceous teeth, Lvs. ellipt. entire downy on each side
8415 Flowers in whorled spikes, Stem erect, Lvs. linear very blunt nerveless revolute at edge ciliated at base
8416 Pedun. about 3-fl. axillary, Lvs. ovate blunt nerved entire sess. Cor. twice as long as calyx, Stem villous
8417 Heads laxly imbricated, Bractes broad ovate colored not dotted, Leaves linear entire
8418 Heads imbricated large, Bractes toothed, Leaves setaceous hairy
8419 Flowers whorled, Stem half-shrubby erect, Leaves hispid acuminate
8420 Flowers axillary subsolitary stalked, Leaves cordate acute entire, Stems filiform

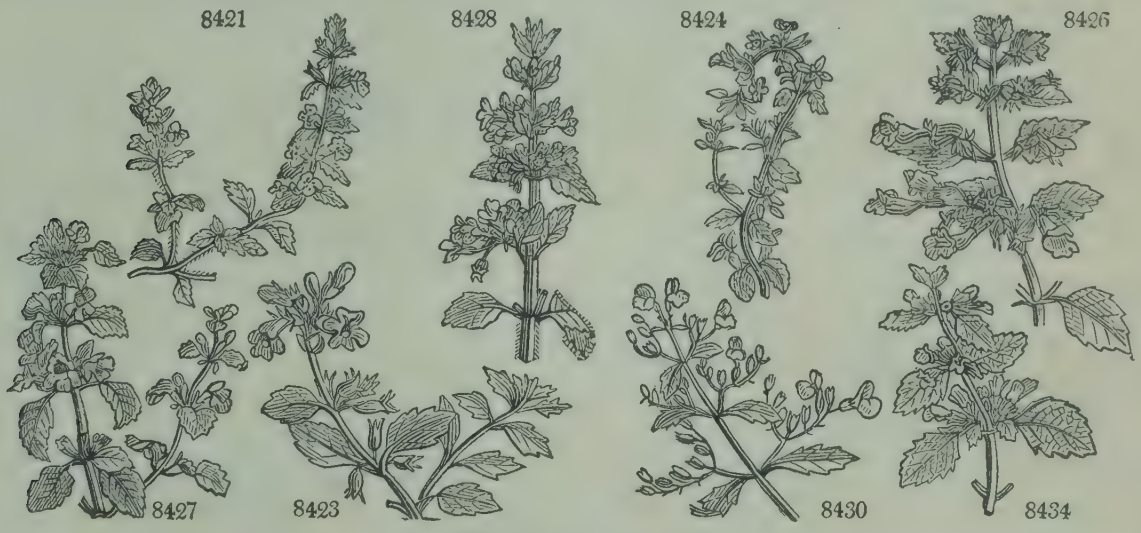
8421 Stem erect branched at base, Leaves ovate acute serrated forwards, Whorls 6-flowered

8422 Hirsute villous larger than the last, Stem much branched, Leaves ovate
8423 Whorls 6-fl. Leaves nearly blunt roundish concave subserrated
8424 Nearly smooth, Whorls 6-10-fl. Leaves ovate subserrate, Stem ascending
8425 Fls. whorled, Pedunc. 1-flow. Stem branched spreading, Leaves roundish acute subserrate at end hairy

8426 Pedun. axill. 3-4-fl. Bractes lanc. sessile, Leaves ovate acute finely serrated
8427 Leaves rhomboid oval obsoletely toothed upwards, Whorls somewhat stalked about 10-fl. shorter than leaf

8428 Stem weak, Pedun. axill. many-fl. dichotomous, Lvs. ovate blunt serrated hairy dotted
8429 Pedunc. axill. many-fl. in dichotomous corymbs, Lvs. ovate blunt subserrate smoothish
8430 Leaves ovate somewhat toothed glaucous, Pedunc. axill. dichotomous, Segm. of calyx equal
8431 Racemes terminal, Peduncles solitary very short
8432 Branches thin twiggy, Leaves downy beneath

8433 Villous, Leaves cordate crenate-toothed, Branches axillary elongated flowering
8434 Whorls halved subsessile, Bractes oblong stalked, Leaves ovate acute serrated



and Miscellaneous Particulars.

these aromatic plants, unless now and then by accident, or when they are first turned on hungry to downs, heaths, or commons; but the soil and situations favorable to aromatic plants produce a short sweet pasturage best adapted to feeding sheep, whom nature designed for mountains, and not for turnip grounds and rich meadows. The attachment of bees to this and other aromatic plants is well known.

Few plants are subject to more varieties than wild thyme. In its most natural state, on dry exposed downs, it is small and procumbent; but when it grows among furze or other plants, it runs up with a slender stalk to a foot or more in height. It differs also very much in the smoothness or hairiness of its leaves. The flowers are sometimes larger than ordinary, and of a paler purple color, or even white.

T. vulgaris has the aromatic qualities common to lavender, sage, rosemary, and other Verticillatæ. It yields a species of camphor in distillation with water. In Spain they infuse it in the pickle with which they preserve their olives. Before the oriental spices were common, it was much used in cookery.

1276. *Acynos.* The Greek name of a balsamic plant, which probably was related to Thymus. This genus was included in Thymus by Linnæus.

1277. *Calamintha.* From καλος, beautiful, and μινθη, mint. An ancient Greek name of a plant supposed to chase away serpents.

1278. *Melissa.* This is the Greek name of the bee, from μελι, honey, which is sought by bees in these flowers with avidity, as indeed it is in all the plants of the order. The recent plant has the agreeable odor of

History, Use, Propagation, Culture,

lemons, which is lost in drying, and an austere, slightly aromatic taste. In distillation with water, it yields a small portion of a yellow essential oil, on which its odor depends. It is stomachic and diuretic, and was formerly prized as a corroborant in hypochondriacal and nervous affections; but it is now used only in the form of tea, as a grateful diluent in fevers. For medicinal use the herb should be cut before it flowers, as it is then more odorous. (*London Dispensatory*, 383.)

1279. *Dracocephalum.* From δρακων, a dragon, and κεφαλη, a head. A name applied in the same sense as Lamium, Galeopsis, &c. See those genera. Most of the species are plants of ornament, and cultivated as such in the gardens of the curious. D. canariense smells of citron, especially when rubbed between the fingers. Sown on a hot-bed early in spring, it may be planted out in the borders like other tender annuals. D. austriacum is a handsome plant for a flower border.

8435 Smooth, Flowers spiked close, Leaves linear lanceolate serrated
8436 Flowers spiked remote, Leaves obovate lanceolate toothletted upwards
8437 Spikes short 4-cornered, Corolla variegated, Leaves oblong toothletted upwards
8438 Flowers spiked, Leaves ternate oblong
8439 Fl. somewhat spiked, Lvs. roundish cuneiform sinuate-toothed, Upper lip of cal. undivided mucronate
8440 Fl. somewhat spiked, Leaves lanceolate remotely mucronate toothed, Bractes lin. lanc. toothed spiny
8441 Fls. spiked, Lvs. sessile linear mucronate, Cauline 3-5-parted at base, Stem branched somewhat villous
8442 Flowers spiked, Leaves and bractes lanceolate undivided pointless, Stem nearly simple smooth
8443 Fls. whorled, Lvs. obl. blunt toothed stalked, Bractes lanc. entire, Upper lip of cal. elipt. blunt undivided
8444 Fls. whorled, Rad. lvs. cord.ov. ; cauline sessile roundish wedge-shaped acutely toothed, Teeth of cal. equal
8445 Flowers whorled, Whorls stalked bifid one-sided, Leaves lanc. cordate acum. serrated smooth
8446 Flowers whorled, Bractes lanceolate deeply toothed dotted beneath, Lower serratures subciliated

8447 Flowers whorled, Bractes oblong ciliated, Cal. striated pubescent, Tube of cor. longer than calyx
8448 Flowers whorled, Bractes orbicular serrate ciliate
8449 Stem erect, Leaves linear lanceolate blunt entire at edge rough, Two upper teeth of calyx largest
8450 Leaves broad-lanceolate finely serrated entire at base, Lower teeth of calyx longest
8451 Flowers in spiked heads, Leaves roundish pinnatifid crenate downy on each side
8452 Flowers whorled, Bractes oblong ovate entire, Cor. twice as long as calyx nodding
8453 Flowers whorled, Bractes oblong entire, Cor. scarcely larger than calyx

8454 Leaves opposite ovate toothed, Calyx 3-lobed hairy

8455 Cal. 4-lobed smooth, Cor. yellowish white, Segment of lower lip violet in the middle

8456 Flowers in panicled fascicles, Stem much branched
8457 Racemes panicled, Leaves ovate oblong cuneate at base acutely serrated hoary beneath
8458 Racemes panicled, Leaves ovate cuneate at base bluntly serrated, Veins hairy above rough beneath
8459 Stamens toothless, every other one bearded at base
8460 Stem ½ shrubby, Leaves lanceolate ovate subtomentose, Racemes rounded
8461 Stem shrubby, Leaves ovate serrate, Stamens very long
8462 Leaves ovate smooth, Calyxes ciliated
8463 Leaves ovate entire
8464 Leaves somewhat oblong blunt serrated wavy, Stem hairy, Bractes cordate
8465 Leaves ovate oblong, Foot-stalks, bractes and calyxes ciliated
8466 Leaves sublanceolate acuminate subserrate, Racemes rounded, Stem nearly herbaceous
8467 Leaves ovate-oblong serrated, Bractes cordate reflexed concave, Spikes filiform
8468 Cor. 4-fid, Racemes leafless nodding at end
8469 Leaves linear lanceolate serrate [than calyx
8470 Lvs. broad ovate acum. at each end serr. Bractes shorter than cal. winged at edge, Cor. scarcely longer
8471 Leaves ovate cordate acute serrated rugose, Recesses closed, Bractes roundish wedge-shaped
8472 Leaves ovate, Flowers aggregate, Footstalks lateral
8473 Downy, Lvs. ovate lanceolate crenate stalked, Whorls terminal racemose, Corolla the length of calyx
8474 Leaves oblong elliptical serrated hoary on long stalks, Stamens twice as long as corolla
8475 Like Ocymum polystachyon, but not having a musky scent as that has

8476 Nectary spurred, Racemes compound, Pedunc. 3-parted, Stem shrubby polished
8477 Nectary gibbous, Racemes leafless, Stem nearly equal
8478 Nectary gibbous, Racemes compound, Pedunc. 1-flowered whorled, Stem half shrubby nearly smooth
8479 Cor. falcate, Flower-stalks branched

8480 Nectary gibbous, Fiowers spiked, Stem herbaceous hairy rufous dotted
8481 Flowers whorled sessile, Lower lip of calyx 4-parted, Bractes cordate acuminate
8482 Stem 6-angled, Leaves ternate stalked ovate crenate rugose, Roots tuberous
8483 Leaves stalked cordate crenate hairy, Bractes nearly equal to flower ovate

and Miscellaneous Particulars.

1280. *Melittis.* A name with the same meaning as Melissa.

1281. *Ocymum.* Said by Mathiolus to be derived from ὄζω, to smell, on account of the powerful scent of the plants. O. gratissimum is cultivated in China for culinary purposes. O. Basilicum (βασιλικος, royal) and minimum, are culinary aromatics much used in French cookery. There are several varieties of the basilicum, which with some other species were formerly used in medicine, but are now neglected.

1282. *Plectranthus.* From πληκτρον, a cock's spur, and ανθος, a flower, the corolla of the original species of the genus being terminated by a spur-like appendage. Half-shrubby plants with purple flowers, all natives of hot climates.

History, Use, Propagation, Culture,

1283. *Trichostema.* From θριξ τριχος, hair, and στημα, a stamen, because its long slender stamens resemble hairs.

1284. *Prostanthera.* Named in allusion to the spurs of the anthers, the word being derived from προσθηκη, an appendage, and ανθηρα, the anther. Strong smelling shrubs, natives of New Holland. Flowers either racemose or terminal.

1285. *Scutellaria.* From *scutilla*, a small vessel, on account of the figure of the calyx, which is not unlike a cup with its handle. The calyx inverted, presents the figure of a helmet with visor raised.

1286. *Prunella.* A barbarous name softened down by Linnæus from the Brunella of some authors, and so called from the German *die Bräune*, a disorder in the jaws and throat, which this plant is said to cure. Herbaceous plants common by way-sides all over Europe.

8484 Stamens very long exserted, Leaves linear
8485 Stamens short included

8486 Leaves lanceolate tooth-serrated smooth, Racemes panicled, Corolla hairy

8487 Leaves cut downy beneath, Spikes rounded 4-cornered
8488 Leaves cordate cut crenate pubescent on each side shorter than footstalk, Spikes short 4-cornered
8489 Leaves subcordate serrate rugose opaque, Spikes 1-sided, Bractes ovate
8490 Leaves cordate cut serrate crenated, Spikes imbricated rounded 4-cornered, Bractes twice as short as fl.
8491 Leaves cordate cut serrate acute smooth, Spikes imbricated rounded 4-cornered, Bractes length of flower
8492 Much branched, Leaves smooth with a scabrous keel, Racemes lateral leafy
8493 Hairy, Leaves ovate rhomboid crenate, Flowers subracemose
8494 Leaves cordate lanceolate crenate, Flowers axillary
8495 Leaves cordate ovate nearly entire, Flowers axillary
8496 Leaves quite entire, lower hastate, upper sagittate, Flowers axillary
8497 Branched very smooth, Leaves stalked linear lanceolate acute entire, Racemes loose leafy, Cal. blunt
8498 Simple densely pubes. Lvs. subsess. obl. or linear blunt entire attenuated at base, Racemes loosish leafy
8499 Branched tall pubescent, Leaves ovate acuminate serrate on short stalks, Racemes usually panicled
8500 Leaves cordate ovate crenate, Flowers solitary axillary, Each lip of cor. trifid
8501 Leaves cordate serrate, Spikes elongated 1-sided, Bractes stalked ovate longer than calyx
8502 Leaves oblong cordate serrate pubes. Spikes elongated 1-sided, Bractes stalked ovate shorter than calyx
8503 Leaves cordate oblong acuminate serrate, Spikes nearly naked
8504 Villous, Leaves cordate blunt and bluntly serrated, Spikes imbricated, Bractes setaceous
8505 Subvillous, Leaves ovate entire all alike, Flowers axillary
8506 Related to S. albida from which it differs in being much less hairy, and in its more slender flower
8507 Lvs. cord. cren. serrate bluntish villous, Spikes long 1-sided hispid, Bractes stalked ovate longer than cal.

8508 Lvs. stalked obl. ovate somew. toothed, Upper lip of cor. trun. with 3 awns, Stem ascending, Spike round

8509 Leaves broad ovate toothed, Stem much branched, Spikes ovate
8510 Lvs. stalked ovate lanc. toothed at base, Lips of cal. equal: upper truncate with 3 awns, Stem ascending
8511 Leaves sessile lanceolate entire rough, Stem erect
8512 Leaves stalked oblong ovate toothed at base, Upper lip of cor. trifid, Stem ascending
8513 Small, Stem nearly simple villous, Leaves pinnatifid lower oblong, Cor. pale yellow
8514 Leaves entire and sinuated toothed rugose hairy, Upper lip of cor. truncate slightly 3-toothed
8515 Upper leaves linear-lanceolate: lower sinuate toothed somewhat hairy

8516 Bractes laciniate

8517 Leaves ovate oblong serrated
8518 Leaves ovate with a double crenature on each side

8519 Leaves stalked ovate serrated, Spikes terminal long

ANGIOSPERMIA.

8520 Leaves lanceolate ovate serrated somewhat stalked terminal, Pedunc. 3-fl. shorter than leaves
8521 Leaves ovate lanceolate crenate hairy, Peduncles lateral very long bearing corymbs
8522 All vill. Branches rounded, Lvs. opp. obl. ovate cren. Ped. 2-4 axill. 1-fl. aggregate, Cor. clavate cylind.
8523 All pubes. Lvs. opp. ovate ellipt. cord. at base serr. cren. Panicle numer. opp. spread. dist. Ped. corymbose
8524 All pubes. Lvs. ovai lanc. velvety above, Panicle leafy, Fl. with a campan. inflated orifice, Limb oblique
8525 Leaves opposite ovate crenulate tomentose, Flowers axillary 2-3 together downy

8526 Leaves oblong cordate crenate rugose, Stem spotted
8527 Leaves hoary ellipt. or oblong crenate, Pedunc. erect longer than flower, Sepals angular acuminate

and Miscellaneous Particulars.

1287. *Cleonia.* An ancient Greek name employed by Theophrastus, *lib.* 7. *cap.* 4.: the Cleonæum of Pliny. This is an annual plant six or eight inches high, and nearly related to Prunella, from which some eminent French botanists do not distinguish it.

1288. *Prasium.* The Greek name of the horehound, which this plant resembles in some respects.

1289. *Phryma.* A Linnean name, the meaning of which is unknown.

1290. *Gesneria.* In honor of Conrad Gesner, of Zurich, the famous botanist and natural historian, called the German Pliny. Very fine herbaceous or half-shrubby plants, some of which are remarkable for the brilliance of their colors..

1291. *Gloxinia.* In memory of Ben. Petr. Gloxin, of Colmar, author of Observationes Botanicæ, Argent,

History, Use, Propagation, Culture,

1785, quarto. Handsome low herbaceous plants, with fine shewy flowers. The Gloxinia speciosa is a favorite in every hothouse, on account of the beauty of its rich purple blossoms.

1292. *Linnæa.* So named by Gronovius, in honor of the celebrated Carl von Linné, the reformer of natural history, and the father of the modern physical sciences. His works are not less numerous than important; it is to be wished that such another man, with equal talent, industry, and judgment, could be found at the present day, to rescue the science of natural history from the confusion to which it is fast approaching.

1293. *Melianthus.* From μελι, honey, and ανθος, flower. A shrub, native of the Cape of Good Hope, the blossoms of which are a great attraction to bees. Both the known species are common in collections, but seldom flower.

1294. *Bignonia.* In memory of Abbé Bignon, librarian to Louis XIV., born 1662, died in 1743. He was the friend and patron of most of the learned men of his time, and especially of Tournefort, by whom this truly noble genus was named. The species are trees or shrubs, inhabitants of hot climates: the leaves are opposite, pinnate, ternate, or conjugate: the flowers in panicles, large, and handsome, of various colors, red, blue, yellow, or white, and eminently beautiful. The stove sorts grow freely in loam and peat, and young cuttings root in sand under a hand-glass. The hardy species grow in any soil, but will not flower well unless the situation be warm. They are increased by cuttings of the roots, by layers, or by young cuttings on gentle heat under a hand-glass or frame. B. radicans is a well known and much admired species, capable of living in the open air in this country against a wall.

1295. *Jacaranda.* The name of the tree in Brazil. Two kinds remarkable for the goodness of their wood, are described by Piso. Those in the gardens are lofty stove plants with fern-like, elegant leaves, and panicles of beautiful blue flowers. They grow with facility, but flower seldom.

8528 The only species

8529 Stipules solitary adhering to stalk, Leaves smooth
8530 Stipules twin distinct, Leaves hoary beneath

8531 Leaves conjugate cirrhose, Leaflets ovate acuminate, Peduncles axillary 1-flowered
8532 Leaves conjugate cirrhose, Leaflets ovate-lanceolate, Pedunc. 2-flowered, Pods linear

8533 Leaves conjugate, Leaflets elliptical entire coriaceous, Pedunc. 5-flowered axillary, Calyx entire
8534 Lvs. conjugate obl. smooth, Racemes term. Branches dichotomous, Corollas very soft and downy outside
8535 Leaves conjugate cordate ovate, Flowers racemose, Calyx with a double limb
8536 Leaves conjugate cirrhose: lower ternate, Leaflets ovate cord. acuminate, Racem. axill. Stem muricated
8537 Leaves conjugate quite smooth, Tendrils longer than petiole trifid at end hooked
8538 Leaves conjugate cirrhose, Leaflets cordate lanceolate, Lower leaves simple
8539 Leaves conjugate cirrhose, Leaflets cordate ovate downy beneath
8540 Leaves conjugate cirrhose, Leaflets elliptical blunt, Flowers racemose, Pedunc. 3-fl. Calyxes toothed
8541 Leaves conjugate cordate ovate smooth, Lower racemes leafy, Limb of calyx leafy entire
8542 Leaflets 9-lanceolate subserrate dotted beneath, Corollas ventricose bearded in the orifice
8543 Lvs. conjugate cirrhose, Leafl. obl. acute at each end, Corymb trifid term. Ped. petioles and branches rough
8544 Climbing, Lvs. smooth upper conjugate cirrhose obl. ovate acumin. Peduncles corymbose many-flowered
8545 Lower leaves ternate, upper conjugate, Petioles dichotomous cirrhose, Fruit echinate
8546 Leaves ternate smooth, Leaflets ovate acuminate, Stem shrubby erect
8547 Leaves digitate, Leaflets entire obovate
8548 Leaves digitate, Leaflets lanceolate acuminate entire smooth, Flowers terminal solitary
8549 Lvs. pinnate, Leaflets ovate acuminate toothed, Corymb terminal, Tube of cor. thrice as long as calyx

8550 Leaves pinnate, Leaflets ovate acuminate toothed, Panicle terminal, Tube of cor. the length of calyx
8551 Leaves pinnate, Leaflets oblong lanceolate serrate, Raceme simple terminal, Stem erect
8552 Leaves pinnate with an odd one, Leaflets ovate entire pubescent, Corollas bearded half pentandrous
8553 Leaves pinnate with an odd one, Leaflets ovate hirsute, Cal. 1-leaved spathaceous, Cor. hypocrateriform

8554 Leaves pinnate of four pair, Leaflets elliptical generally entire, Racemes compound
8555 Leaves bipinnate, Leafl. roundish ovate cordate acuminate, Fl. pentandrous, Calyx tubular, Cor. 5-fid
8556 Leaves bipinnate, Leaflets oblong obtuse, Panicle terminal, Peduncles with bractes, Pods oblong blunt
8557 Leaves simple linear acuminate, Flowers terminal subumbellate, Stem erect

8558 Leaves bipinnate, Leaflets lanceolate acute, Panicle terminal, Peduncle naked, Pods long emarginate
8559 Leaves bipinnate oblong villous oval oblong mucronate, Panicle large lax branched, Corollas silky

8560 Leaves ovate oblong entire
8561 Leaves ovate lanceolate: lower 3-lobed; upper undivided, Stem erect

8562 Stem smooth, Sterile filament bearded upwards, Leaves lanceolate acuminate all finely serrate
8563 Leaves polished ovate-oblong amplexicaul finely toothletted, lower entire, Flowers panicled
8564 Leaves serrulate lanceolate oblong sessile downy obscurely toothed narrow, Flowers panicled

and Miscellaneous Particulars.

1296. *Sesamum.* From the Arabic word *semsem.* Forskahl, p. 68. These plants were introduced into Jamaica by the Jews, and are now cultivated in most parts of the island. They are called *vanglo* or oil-plant. The seeds are frequently used in broths by many of the Europeans, but the Jews make them chiefly into cakes. Many of the oriental nations look upon the seed as a hearty wholesome food, and express an oil from them, not unlike, or inferior to, the oil of almonds. It has been also manufactured for salad oil in this country, but without much success.

S. orientale is frequently cultivated in the Levant, and also in Africa, as a pulse: the seeds have been introduced in Carolina by the African negroes. An oil is extracted from the seeds which will keep many years, and not acquire any rancid smell or taste, but in two years become quite mild, so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, it is used as salad oil, and for all the purposes of sweet oil.

The seeds are also used by the negroes for food: they parch them over the fire, then mix them with water, and stew other ingredients with them. A pudding is made with them, in the same manner as with millet or rice.

In Japan, China and Cochin-China, where they have no butter, they use the oil for frying fish, and in dressing other dishes; as a varnish; and medicinally as a resolvent and emollient. Nine pounds of the seed yield upwards of two pounds of neat oil.

1297. *Pentstemon.* From πεντε, five, and στημον, a stamen, because of the four perfect and one imperfect stamen of the genus. Beautiful herbaceous plants, deserving a place in every garden.

History, Use, Propagation, Culture,

1298. *Chelone.* Χελωνη signifies a tortoise, to the back of which the helmet of the present genus has been fancifully compared. The species are handsome border flowers, of easy culture in loamy soil, or loam and a little peat.

1299. *Tourrettia.* Named in honor of Marc Antoine Louis Claud la Tourrette, to whom some of Rousseau's Letters on Botany are addressed. A singular climbing annual plant, producing its flowers sparingly from the tips of the branches. Seldom preserved long in a garden, as it produces seed very sparingly.

1300. *Martynia.* In honor of John Martyn, F. R. S., professor of botany at Cambridge, author of Historia Plantarum Rariorum, and many other works: died in January, 1768. His son is the editor of the last edition of Miller's Dictionary. Handsome tropical annuals, remarkable for the size of their flowers compared with their leaves.

1301. *Acanthus.* From ακανθα, a spine: many of the kinds are very spiny. The species are generally large, with a single herbaceous stalk, and great pinnatifid leaves. The flowers are produced in terminating spikes. Some of the species are shrubby and thorny, with undivided leaves, toothed, and having a thorn at the end of the teeth.

A. mollis was formerly used in medicine under the name of *Branca ursina:* the root abounds in mucilage, and may be substituted for those of the marsh mallow. Virgil has two very different plants under the name of Acanthus: one a tree, supposed to be the Mimosa nilotica, which produces the gum Arabic: the other an

8565 Stem pubescent, Sterile filament bearded from the end to the middle
8566 Leaves oblong acute subhirsute, Flowers racemose, Leaves of calyx linear very hairy
8567 Stem smooth long linear entire, Flowers in racemose panicles, Leaves of calyx smooth
8568 Stem and lvs. smooth, Lvs. subamplex. ovate obl. ent. Barren filam. naked clav. Sepals roundish acuminate
8569 Very smooth, Lvs. subamplexicaul. ov. obl. ent. upper roundish, Barren filam. with a short beard at end
8570 Leaves ovate lanc. subserrulate smooth, Fl. fascicled axillary and terminal, Cor. equal 5-cleft spreading

8571 Leaves stalked lanceolate serrate: upper opposite
8572 Leaves lanceolate oblique stalked opposite finely serrated at edge
8573 Smooth much branched, Leaves stalked cordate ovate serrated, Spikes terminal dense
8574 Leaves opposite connate lanceolate entire, Lower lip of corolla bearded

8575 The only species. Leaves pinnated cut cirrhose

8576 Stem branched, Leaves opposite cordate toothed, Flowers diandrous
8577 Stem branched, Leaves opposite 5-lobed toothed
8578 Stem branched, Leaves alternate cordate entire
8579 Stem simple, Leaves roundish repand, Tube of cor. at base gibbous flattened

8580 Leaves sinuated unarmed
8581 Leaves sinuated unarmed glabrous shining green
8582 Leaves pinnated spiny
8583 Leaves laciniate pinnatifid blistered spiny, Spines white
8584 Leaves repand spiny-toothed, Stem shrubby prickly

8585 Spines of whorls 6, Leaves ensiform very long rough
8586 Spines axillary pedate in fours, Leaves quite entire lanceolate ovate
8587 Spines axillary opposite solitary, Leaves roundish entire
8588 Unarmed, Leaves lanceolate, Flowers axillary solitary sessile
8589 Leaves ovate lanceolate rough, Flowers capitate terminal, Bracteæ ciliate
8590 Leaves oblong entire, Two lateral leaves of calyx ciliated wider than the rest; two linear acute
8591 Unarmed, Leaves lanceolate hairy entire, Fl. aggregate terminal tubular, Bractes very narrow setose
8592 Unarmed, Leaves ovate silky, Bractes cordate scarious, Corollas very long

8593 Leaves lanceolate on long stalks, Flowers in terminal and axillary heads, Cor. small

8594 Leaves sessile oblong entire acute at each end villous, Fl. 3-subsessile, Stem ascending
8595 Leaves stalked ovate entire, Peduncles 3-flowered very short, Stem erect
8596 Subvillous, Stem dwarf branched erect, Leaves ovate concave entire
8597 Leaves stalked ovate very blunt entire pubescent, Flowers 3 subsessile, Stem erect divaricating
8598 Lvs. stalked obl. ovate ciliated somewhat toothed, Pedunc. very short about 3-fl. Stem very villous erect
8599 Leaves stalked oblong blunt attenuated at base somewhat toothed, Pedunc. 3-fl. shorter than leaf
8600 Leaves entire, Peduncles dichotomous lateral, Calyxes sessile, with the upper segment largest
8601 Leaves cuneate ovate crenated, Peduncles 3-parted, Stem simple
8602 Flowers twin sessile
8603 Leaves stalked entire ovate downy, Pedunc. axillary alternate few-flow. very long

and Miscellaneous Particulars.

herb, supposed to be this plant. Pliny mentions an Acanthus which covered part of his lawn, which some conjecture to be a moss, a thing very improbable in a climate and situation where the musci are seldom seen even in winter.

The leaf of Acanthus mollis is supposed to have furnished the ancients with the elegant Acanthus leaf of their architecture.

1302. *Barleria.* In honor of the Rev. James Barrelier, a Dominican, and M. D. of Paris, who travelled from France into Spain and Italy, and died aged sixty-eight, 1673; author of Icones, 1714, Paris, folio, a useful work, containing, even at the present day, figures of many things which are to be found nowhere else. The species flower freely and are of easy culture: loam and peat, with a little rotten dung mixed with it, is the best soil for them. Cuttings root freely; they strike best from the young wood, under a hand-glass, in the same kind of soil as the plants grow in. (*Bot. Cult.* 21.)

1303. *Phaylopsis.* Named by Willdenow, from φαυλος, vile or contemptible, and ὀψις, aspect. Tropical weeds.

1304. *Ruellia.* In honor of John Ruelle, a native of Soissons, the physician of Francis I. He published a work De Natura Plantarum, in 1536, and Commentaries upon Dioscorides, in 1516. The species are pretty plants, free flowers, and of the easiest culture and propagation.

History, Use, Propagation, Culture,

1305. *Blechum.* Βληχων, was the Greek name of a plant resembling Marjoram. This genus has also the flowers in a dense bracteated spike. It has been separated from Justicia by Jussieu.

1306. *Aphelandra.* From αφελης, simple, and ανηρ, a male, on account of the single cell of the anthers.

1307. *Crossandra.* From κροσσος, a fringe, and ανηρ, a man; or, in botanical language, an anther, alluding to the fringed anthers. A fine shewy shrub with large orange flowers.

1308. *Thunbergia.* In honor of Charles Peter Thunberg, M. D., knight of the order of Vasa, professor of botany in the university of Upsal, member of several learned societies; author of Travels into Europe, Africa and Asia; Flor. Japonica, &c. Handsome climbing flowers with a fragrant odor.

1309. *Hebenstreitia.* John Ernest Hebenstreit, was a professor of botany in the university of Leipsig, and published, in 1728, a dissertation upon plants. Small Cape undershrubs, occasionally cultivated for the sake of their neat foliage and simple modest flowers. They require an airy greenhouse, and are easily propagated from cuttings.

1310. *Hosta.* After Dr. Nicholas Thomas Host, the author of the superb Gramina Austriaca, in four volumes, folio, and other important works. Smith thinks the genus the same as Linnæus's Cornutia pyramidata.

8604 Leaves stalked ovate acuminate wavy crenate, Fascicles axillary on long stalks
8605 Leaves ovate somewhat toothletted ciliated at edge on long stalks, Flowers solitary axillary sessile
8606 Leaves oblong entire, Flowers solitary sessile, Stem procumbent
8607 Leaves entire ovate subpubescent, Flowers solitary axillary, Stem erect
8608 Leaves ovate lanceolate entire stalked smooth, Fl. solitary axillary sessile, Branches warted
8609 Leaves ovate lanceolate acuminate entire, Peduncles long 2-flowered
8610 Leaves stalked oblong wavy, Heads axillary sessile, Stem erect
8611 Stem erect hairy, Leaves stalked ovate acuminate repand toothed hairy, Spike whorled

8612 Leaves ovate elliptical somewhat toothed, Spikes 4-cornered, Bractes ovate downy

8613 The only species

8614 The only species

8615 Leaves cordate acuminate somewhat angular at base, Stem climbing
8616 Leaves angular cordate, Inner calyx none, Anthers bearded spurred

8617 Leaves linear toothed, Bractes oval linear hairy
8618 Leaves sessile oblong lanceolate blunt serrated hairy at base, Bractes ciliated
8619 Leaves linear toothed, Spikes smooth
8620 Leaves linear quite entire

8621 Leaves linear toothed, Calyxes 3-valved ciliated
8622 Leaves linear toothed at end, Bractes ovate villous, Stem herbaceous
8623 Leaves lanceolate oblong serrated pilose, Bractes entire ciliated hispid
8624 Leaves cordate somewhat fleshy sessile

8925 Corymbs axillary trichotomous

8626 Spines opposite, Leaves ovate entire
8627 Leaves obovate subtrifid and simple, Prickles nearly straight, those of the stem alternate

8628 Leaves opp. ovate acute hairy, Stem prickly downwards, Heads round, Bractes lanceolate
8629 Leaves 3 or 4-ellipt. rugose above villous beneath, Stem unarmed, Spikes oblong imbricated
8630 Leaves opposite, Stem unarmed, Spikes oblong
8631 Leaves opp. oblong lanc. acute, Stem unarmed, Heads roundish, Bractes ovate-lanceolate and squarrose
8632 Lvs. opp. ov. acute serr. rugose rough hairy ben. Stem nearly unarm. rough, Heads obl. Bractes ovate acute
8633 Leaves opposite, Stem unarmed branched, Flowers in leafless capitate umbels
8634 Leaves opp. or in 3s rhomboid ovate blunt rugose downy, Stem unarmed, Heads squarrose, Bractes ovate
8635 Leaves opposite oval rugose, Stem unarmed, Heads squarrose, Bractes oblong, Pedunc. longer than leaf
8636 Lvs. opp. or in 3s ellipt. rugose, Stem unarmed, Heads squarrose with lanc. bractes, Ped shorter than leaf
8637 Leaves opp. ovate obl. villous soft, Stem prickly, Spikes hemispherical, Bractes half as short as tube
8638 Lvs. opp. ovate ellipt. rough, Stem prickly, Spikes hemispherical, Bractes half as short as tube lanc. acute
8639 Leaves ovate lanceolate acuminate crenulate, Stem prickly, Head hemispherical, Bractes linear
8640 Leaves ovate subcordate softish beneath, Stem prickly, Bractes of heads linear cuneiform
8641 Lvs. ovate rugose crenate blunt downy running down the foot-stalk, Head depressed shorter than leaf
8642 Leaves opposite ovate rough above hoary beneath, Heads conical, Bractes squarrose ovate acute nerved
8643 Leaves narrowed from an ovate base sessile serrate pubescent, Bractes lanceolate concave
8644 Leaves ovate narrowed into the stalk acuminate acutely crenate pubescent, Outer bractes cordate

8645 Leaves linear lanceolate ternate, Stem shrubby

and Miscellaneous Particulars.

A small shrub rising to the height of four feet. Leaves opposite, ovate, acuminate, somewhat toothed, smooth. Flowers blue, in axillary corymbs, which are shorter than the leaves; they are dotted all over with minute white glandular spots.

1311. *Gmelina.* In honor of John George Gmelin, a German naturalist, professor of medicine and botany at Tubingen, who travelled in Siberia and Kamtchatka, by order of the Empress Anne of Russia. His Flora Sibirica, in four quarto volumes, is a book of continual reference. These are fine arborescent Indian plants with beautiful flowers, which are seldom produced in this country. They require the utmost heat of the stove.

1312. *Lantana.* One of the ancient names of the Viburnum, which this resembles a little in foliage. The species are rapid growers and free-flowerers, and readily increased by cuttings. They form small bushes with pink, yellow, orange, or changeable heads of flowers, and a peculiar aromatic odor.

1313. *Aloysia.* Named by Don Antonio Palau, professor of botany at Madrid, and author of an excellent translation of the Linnæus's Species Plantarum into Spanish, after her majesty Maria Louisa, queen of Spain, and mother of the reigning king, Ferdinand.

History, Use, Propagation, Culture,

A deciduous under shrub with a most agreeable odor of citrons, and of the easiest culture in any soil. In Jersey and Guernsey, it stands the winter in warm situations.

1314. *Lippia.* Named in honor of Augustine Lippi, a French physician, born in Paris of an Italian family. He accompanied the ill-fated embassy of Lenoir Duroule to the king of Abyssinia, in the beginning of the eighteenth century, and was assassinated along with the ambassador at Sennaar. His merits entitled him to a more interesting genus than this, which consists of obscure weedy shrubs of South America.

1315. *Melampyrum.* From μελας, black, and πυρος, wheat. Its grain resembles a grain of wheat, and gives a singularly black color to bread in which it is mixed. Smooth narrow-leaved weeds, not uncommon in corn fields and copses. M. pratense is considered nutritive, and was formerly cultivated by the Dutch and Flemish in the manner of Spurrey.

1316. *Sclago.* This has nothing beyond its name in common with the Selago of the ancients; nor is it possible to imagine what induced Linnæus to apply it to the present plants, which are pretty half-shrubby Cape plants, with beautiful corymbs or spikes of flowers. Hardy greenhouse plants, propagated with facility by cuttings.

1317. *Vitex.* An ancient name applied to some plant of the osier tribe. V. Agnus Castus is an autumn shrub, with whorled spikes of blue and white flowers from seven to fifteen inches long. The dried leaves have a powerfully aromatic odor. The seeds, from the time of Dioscorides and Pliny, have been highly celebrated for securing chastity; hence the absurd officinal name of the shrub, Agnus castus; αγνος, in Greek, being the same with *castus* in Latin: and hence the Athenian matrons, in the sacred rites of Ceres, used to strew their

8646 Leaves oblong acute serrate rough above pubescent beneath, Heads globose, Bractes obl. lowest longest

8647 Spikes quadrangular, Bractes cordate compact toothletted imbricated
8648 Spikes conical lax, Bractes toothed setaceous colored, Teeth of calyx rough, Corolla closed
8649 Flowers axillary 1-sided, Corollas closed, Leaves lanceolate; floral hastate
8650 Flowers axillary 1-sided, Corollas gaping, All the leaves lanceolate

8651 Leaves linear acute entire reflexed rigid fleshy smooth, Spikes terminal
8652 Leaves linear smooth, Spikes terminal, Branches diffuse
8653 Leaves linear serrate toothed subciliated fleshy, Spikes corymbose
8654 Spikes terminal, Bractes and calyxes keeled rough, Leaves linear smooth reflexed at edge
8655 Leaves sessile linear lanceolate acute entire smooth, Spikes terminal solitary
8656 Spikes corymbose, Leaves linear toothletted
8657 Corymb multiplex, Leaves obovate smooth serrated
8658 Leaves obovate entire shining, Spikes rounded terminal, Stem shrubby
8659 Stem diffuse pubescent upwards, Lvs. lanceolate blunt finely serrate smooth, Spikes terminal subsolitary
8660 Lvs. rounded with a furrow on each side acutish somewhat toothed smooth fleshy, Spikes term. aggregate
8661 Spikes cone-like ovate terminal, Leaves scattered linear, Stem shrubby
8662 Spikes terminal, Leaves filiform fascicled smooth
8663 Leaves filiform fascicled smooth, Panicle compound

8664 Leaves simple ovate
8665 Leaves ternate entire, Panicle whorled, Berry 3-seeded
8666 Leaves digitate 7 or 5 lanceolate nearly entire, Spikes whorled panicled

8667 Leaves digitate 5, Leaflets cut-pinnatifid, Spikes somewhat whorled
8668 Leaves digitate 5, Leaflets stalked oblong entire, Panicle dichotomous, Berry 1-seeded
8669 Leaves quinate and ternate serrate, Flowers in panicled racemes
8670 Lvs. ternate and quinate, Leafl. lanc. acum. ent. beneath white with down, Branches of pan. dichotom.
8671 Leaves ternate and quinate, Leaflets ovate acute entire hoary beneath, Panicle with a straight rachis

8672 Panicle terminal naked elongated

8673 Spikes ovate, Leaves lanceolate serrated plaited, Stem fruticose
8674 Spikes roundish conical, Leaves cuneiform toothed, Stem creeping

8675 Spikes lax, Cal. of fruit reflexed roundish didymous hispid

8676 Spikes filiform very long, Cal. of fruit reflexed hispid, Tube of corolla spiral

8677 The only species

8678 Spikes fascicled, Leaves oblong lanceolate stem-clasping, Stem very tall trichotomous at end
8679 Spikes long acuminate, Leaves hastate
8680 Spikes filiform panicled, Leaves lanceolate coarsely serrated

and Miscellaneous Particulars.

couches with the leaves. Hence also it has had the affected name of Piper eunuchorum and monachorum. The seeds of the chaste-tree are, however, so far from being thought antiaphrodisiac, that writers of later times have ascribed to them an opposite quality; their aromatic pungency seems to favor this opinion, and Bergius states them to be carminative and emmenagogue. (*Woodville.*)

The fruit of V. trifolia is reputed in the eastern countries to be warm, discutient, nervine, cephalic, and emmenagogue; and to be of service in paralysis, weakness, and pains of the limbs. It is in great use among the Indian practitioners, both internally and externally. The plant has a bitter taste, and a strong somewhat aromatic smell.

1318. *Cornutia.* So named after Jacques Cornut, a French physician, who travelled into Canada, and published an account of the plants of that country in 1635. Cornutia pyramidata is a shrub with square branches, elliptical ovate entire hoary leaves, and naked pyramidal terminal branches of flowers.

1319. *Zapania.* Named by Scopoli, after Paul Anthony Zappa, an Italian botanist.

1320. *Priva.* A genus of small Verbena-like herbaceous plants, with little blue flowers. The derivation of the name is unknown.

1321. *Spielmannia.* In honor of James Reinhold Spielmann, professor of medicine and botany at Strasburg, author of Prodromus Floræ Argentoratensis; Pharmacopœia Generalis, &c. A shrub of easy culture in any light soil, and cuttings root freely under a glass.

1322. *Verbena.* Said by De Theis, to be derived from *ferfacn*, its name in Celtic. A genus of weedy plants,

History, Use, Propagation, Culture,

with the exception of Verbena Aubletia and Lamberti. V. officinalis was held sacred among the ancients, and used in making leagues by ambassadors, sacrificial rites, incantations, &c.; and by the moderns as an amulet, and for medical purposes: it is now, however, entirely out of use.

1323. *Avicennia.* Named after Abu Vali Ibn Tsin, commonly called Avicennes, a Persian physician, born in 980, died in 1036. His Rules of Medicine were formerly the text-book of physicians, and have occupied the learning and time of many commentators.

1324 *Caldasia.* Named by Willdenow in compliment to Don Josef Caldas, an eminent botanist, native of Popayan, in New Grenada.

1325. *Clerodendrum.* From κληρος, accident, and δενδρον, a tree, in allusion to the various effects in medicine by its various species. Clerodendrum fortunatum is useful, C. calamitosum and infortunatum, dangerous. The species grow freely in light rich soil, composed of half loam, one-fourth of rotten dung, and one-fourth peat. They require a large pot to flower freely, and cuttings root readily under a hand-glass: the younger the shoots the better. The handsomest species are C. paniculatum and C. squamatum. (*Bot. Cult.* 41.)

C. inerme is hardy enough to live in the open air against a wall, but it must have the protection of a mat in winter.

1326 *Volkameria.* Named after John Christopher Volkamer, a German botanist, who died in 1720. John

8681 Spikes filiform, Leaves linear lanceolate subserrate
8682 Spikes filiform, Leaves lanceolate serrate bluntish subsessile
8683 Spikes filiform panicled, Leaves ovate serrate acute stalked
8684 Hoary, Spikes cylindrical upright, Leaves ovate serrate subsessile, Stem erect round
8685 Spikes solitary stalked, Leaves trifid cut
8686 Decumbent hirsute, Leaves cut, Flowers spiked, Bractes linear very long squarrose
8687 Spikes lax solitary, Stem hispid decumbent rooting, Leaves oblong cut-toothed entire at end
8688 Spikes filiform, Leaves multifid cut, Stems numerous
8689 Spikes filiform panicled, Leaves multifid cut, Stem subsolitary
8690 Spikes filiform solitary, Leaves bipinnatifid
8691 Hirsute, Spikes filiform solitary, Leaves serrate cut, Calyxes twice as long as fruit

8692 Leaves oblong blunt downy beneath

8693 The only species

8694 Leaves subcordate tooth-serrate pubesc. with 2 glands at base, Corymb terminal hemispherical compact

8695 Somewhat downy, Leaves cordate toothed, Cal. large 5-cornered viscid, Segm. of cor. on one side
8696 Leaves subcordate entire, Cor. thrice as long as tube of calyx, Limb bilabiate
8697 Leaves lanceolate quite entire
8698 Leaves cordate obscurely angular, Panicles of branches dichotomous smooth
8699 Leaves 5-lobed toothletted smooth, Panicle brachiate, Axillæ woolly
8700 Leaves lobed and undivided broad ovate entire, Panicle trichotomous
8701 Leaves elliptical acute entire and calyxes downy, The calyx in fruit thickened colored, Corymbs clustered
8702 Leaves oblong lanceolate entire, Petioles peduncles and calyx hairy
8703 Leaves lanc. or lin. lanc. entire quite smooth, Corymbs axill. and term. Cal. 5-toothed and pedunc. smooth
8704 Leaves ovate entire shining, Petioles peduncles and calyxes smooth
8705 Leaves whorled long lanceolate entire smooth, Corymbs axillary few-flowered, Corollas very long
8706 Leaves broad-ovate acuminate serrate subsessile downy beneath, Cal. 5-toothed, Cor. labiate
8707 Leaves ovate entire toothed and angular, Peduncles axillary about 2-flowered
8708 Leaves ovate blunt downy beneath ribbed rugose, Corymb trichotomous

8709 Leaves oblong acute entire, Spines from the rudiments of petioles
8710 Leaves obovate entire retuse shining, Peduncles axillary about 1-flowered
8711 Unarmed, Leaves cordate ovate acute toothed, Racemes 1-sided

8712 Leaves stalked cordate crenate smooth

8713 Leaves ovate, Flowers thirsoid

8714 Branches round, Leaves oblong acuminate entire, Racemes pendulous, Calyxes toothed
8715 Branches round, Leaves elliptical emarginate blunt entire, Racemes erect, Calyxes somewhat toothed
8716 Branches square, Leaves obovate pubescent beneath somewhat toothed at end, Racemes nodding
8717 Branches bluntly 4-cornered, Leaves ovate obl. toothed upwards pubesc. beneath Fl. bracteate pendulous
8718 Branches square, Leaves ovate acuminate entire, Racemes nodding

8719 Calyxes in fruit twisted, Leaves obovate oblong
8720 Calyxes in fruit erect, Leaves oblong lanceolate acuminate
8721 Spiny, Leaves 9 lines long 3 lines broad subserrate attenuated at each end, Teeth of cal. short subciliated

and Miscellaneous Particulars.

George Volkamer, his brother, born 1616, died in 1693, wrote many academical dissertations, and a Flora of Nuremberg, which was not published till after his death. The species are ornamental plants with the habit of the last genus.

1327. *Holmskioldia.* A Theodore Holmskiold, a Dane, published some obscure works upon Cryptogamous plants. A handsome herbaceous stove plant, remarkable for the large calyxes of a bright red color.

1328. *Petrea.* So called by Houstoun, in honor of Robert James Lord Petre, born in 1710, died in 1742. The famous Peter Collinson, in a letter to Linnæus, speaks of his death as the greatest loss that botany or gardening ever felt in this island. A climbing plant with blue flowers.

1329. *Citharexylum.* From κιθαρα, a lyre (hence guitar), and ξυλον, wood. This tree produces a wood which in America is very useful for carpenters' work. It is very hard, and has been supposed applicable to making musical instruments, a mistake which arose thus; C. melanocardium is called by the French *fidèle*, from its faithfulness or durability in building; the English have corrupted the name to fiddle-wood, as if it were used for making musical instruments, which is a mistake. (*Miller.*)

Cuttings root in sand under a hand-glass.

1330. *Duranta.* After Castor Durantes, physician to Pope Sixtus V., author of Herbarium, 1584, died in 1590. The species grow and flower freely in loam and peat, and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture,

1331. *Pedalium.* Πηδαλιον, a Greek word signifying a nail or point. This plant produces a hard and nut-like fruit with four sharp points or horns.

1332. *Myoporum.* From μυω, to shut up, and πορος, a pore; the spots which cover the leaves being, as it were, pores closed with some semi-transparent substance.

1333. *Stenochilus.* From στενος, narrow, and χειλος, a lip; the narrow lip distinguishing this genus from some of its kindred. Very pretty New Holland small shrubs, with fine red flowers.

1334. *Bontia.* James Bont or Bontius was a Dutch physician, born at Batavia, published in 1658, a natural history of the East Indies, in the manner of Piso. A South American plant, with the appearance of a Daphne. The leaves are alternate, fleshy, and crenated, and the flowers axillary.

1335. *Orobanche.* So called from οροβος, a vetch, or other leguminous plant, and αγχειν, to strangle, in allusion to the well known effect of these parasites in destroying the plants upon which they grow. The species are fleshy herbs of a russet color, fastening themselves to the roots of other plants, and chiefly to Leguminosæ. The root is tuberous, imbricate with scales, and sends out fibres into the soil; the stem is without leaves, scaly, and generally simple: the flowers are in terminating spikes. The whole plant is acrid and astringent, and rejected by all animals, excepting the minuter tribes of Cimices and Thripses.

O. major adheres to the root of broom, furze, and clover, and is particularly destructive to the latter, especially in Flanders, where in some places it deters the farmer altogether from the culture of clover. It has a large, thick, fleshy, oval, scaly root, sometimes bulbous, and sending out fibres which are very brittle. The bulb adheres to the woody roots of furze or broom, and the fleshy root of clover, and the fibres clasp round them.

O. elatior is commonly found adhering to the roots of Centaurea scabiosa and Trifolium pratense. It does

8722 Leaves truncate, Flowers with a strong smell of musk

8723 Leaves elliptical bluntish mucronate and branches smooth, Sepals lanc. very acute, Orifice of cor. villous
8724 Leaves broadish lanc. acumin. very acute and branches smooth, Sepals ovate lanc. Limb of cor. bearded
8725 Lvs. lin. bluntish sometimes toothed at end with the branches glandular, Peduncles occasionally 2-parted
8726 Leaves lanceolate acute serrated and branches warted with glands
8727 Leaves elliptical acute serrated reflexed and branches viscid with glands
8728 Leaves lanc. toothed at end entire at base, Drupes compressed shorter than calyx, Stem prostrate
8729 Leaves lanceolate at base with recurved teeth, Stems diffuse glandular, Peduncles solitary
8730 Leaves serrate cordate sessile

8731 Leaves lanceolate or elliptical entire sometimes toothed at end, Branches downy, Stem diffuse
8732 Stem silky, Leaves spatulate lanceolate much shorter than flower, Stamens a little protruded

8733 Leaves alternate, Peduncles 1-flowered

8734 Stem simple, Cor. 4-fid inflat. Stam. naked downw. Stigma 2-lobed, Lobes distant, Style pubesc. upwards
8735 Stem simple, Cor. 4-fid, Stamens hairy downwards, Stigma obcordate, Style smooth upwards
8736 Stem simple, Cor. 4-fid, Stamens hairy downwards, Stigma retuse, Style smooth upwards
8737 Stem simple, Corolla tubular, Segm. of lip blunt equal, Stamens fringed on one side at base
8738 Stem nearly simple, Cor. 5-fid, Bractes 3, Calyx tubular half 4-cleft
8739 Stem branched, Cor. 5-fid, Bractes 3, Calyx short deeply 4-cleft

8740 Leaves cuneate lanceolate close together
8741 Leaves ovate subcoriaceous separate, Fruit ovate acuminate

8742 Leaves at end palmate-cut, Flowers sessile

8743 Leaves ovate acuminate serrate, Corollas 2-lipped, Calyx 3-leaved, Stamens exserted

8744 Stem quite simple, Corollas pendulous with the lower lip trifid

8745 Upper lip of corolla emarginate 2-toothed, Middle segment of lower lip very short
8746 Upper lip of corolla compressed shorter, Calyxes villous
8747 Lower lip of cor. longer than upper, Middle segm. blunt longer than lateral, Cal. vill. Lvs. deeply toothed

8748 Leaves alternate linear 2-toothed on each side
8749 Leaves alternate lanceolate entire, Floral oval toothed
8750 Upper leaves alternate serrated, Flowers distant lateral
8751 Leaves linear lanceolate serrated, Segm. of lower lip of corolla blunt
8752 Leaves opposite cordate bluntly serrated

and Miscellaneous Particulars.

not appear among clover till the second year. On the borders of corn-fields it is found on Centaurea scabiosa and nigra, Scabiosa arvensis, &c.

O. minor also adheres to common red clover and to Hypochæris radicata. O. ramosa is found on Galeopsis tetrahit. Any of the species may be removed to the garden and planted by the whin or broom.

1336. *Crescentia.* In memory of Pietro Crescenti, of Bologna, author of various agricultural works in the thirteenth century. The fruits after the inside has been scooped out, are dried by the natives of the countries where they grow, and serve for containing water or other fluids.

1337. *Castilleja.* Named after one Castillejo, a Spanish botanist and friend of Mutis. Some of the species of this genus which have not yet been introduced, are very beautiful plants, and would amply repay a collector for his trouble in procuring them.

1338. *Halleria.* After the famous Albert Haller, author of Stirpes Helveticæ, and other considerable works on botany and medicine. A pretty stove plant, with long branches of red flowers. Surely so eminent an investigator of alpine vegetation as Haller was, should have had an alpine genus consecrated to him.

1339. *Lathræa.* Λαθραιος, concealed. The plant is only found in the most hidden recesses of the grove. A curious humble parasite without leaves, in the room of which it is covered with abundance of white fleshy scales.

1340. *Rhinanthus.* From ῥιν, a nose, and ανθος, a flower; because of its ringent corolla compressed, at the upper lip so as to resemble the snout of some animal.

1341. *Bartsia.* Named by Linnæus, in honor of his beloved friend John Batsch, M. D., of whom he gives an interesting and melancholy account in his Flora Suecica. Curious herbaceous plants of very difficult cultivation.

History, Use, Propagation, Culture,

1342. *Euphrasia.* An abridgment of *Euphrosine*, the name of a woman, expressing joy or pleasure. This has been so called from the joyful effects of E. officinalis in disorders of the eyes, but it is now thought to be injurious rather than otherwise. Lightfoot states, that the Scotch Highlanders make an infusion of it in milk, and anoint the patient's eyes with a feather dipped in it.

1343. *Antirrhinum.* From *αντι*, similar, and *ρις*, a nose, because the flowers of most of the species bear a perfect resemblance to the snout of some animal. A. majus and its varieties are popular border flowers of the easiest culture in any dry soil; the other species are also pretty little plants.

1344. *Linaria.* The plant out of flower is very similar to Linum, Flax. The species are for the most part pretty annual plants; and some of them, as L. Cymbalaria, well adapted for growing in pots or for rock-work.

8753 Leaves ovate bluntly toothed, Segm. of lower lip of corolla emarginate
8754 Leaves linear serrated: upper entire, Lateral segments of lower lip of corolla toothletted
8755 Leaves ovate toothed palmate, Flowers spiked, Cor. tubular, Segm. of lower lip blunt

8756 Leaves lanceolate opposite, Flowers racemose, Sepals glandular hairy ovate blunt

8757 Leaves linear lanceolate ternate, Flowers racemose, Sepals glandular hairy lanceolate acute
8758 Leaves lanceolate: upper alternate, Flowers subsessile, Calyxes longer than corolla
8759 Leaves opposite cordate unequally crenate somewhat lobed hairy, Stems procumbent
8760 Leaves opposite ovate downy, Stems procumbent

8761 Leaves cordate 5-lobed alternate smooth, Stems procumbent
8762 Small, Leaves reniform repand very hairy alternate, Stems procumbent
8763 Leaves hastate alternate, Stems procumbent
8764 Leaves hairy alternate roundish ovate, lower obsoletely toothed: upper subsessile entire, Stem procumb.
8765 Leaves hastate alternate, Stems spreading, Petioles occasionally producing tendrils
8766 Leaves hastate alternate, Stem erect much branched, Peduncles stiff
8767 Leaves ternate ovate blunt 3-nerved rough at edge, Spike terminal, Flowers stalked
8768 Leaves ternate ovate lanceolate 3-nerved, Spike terminal, Flowers sessile
8769 Lvs. whorled lanc. 3-nerved, Stems decumbent, Raceme terminal few-flowered, Cor. very large stalked
8770 Leaves linear lanceolate: lower opposite; upper alternate, Racemes lax, Helmet erect 2-parted
8771 Leaves 4 linear lanceolate, Flower-stem erect spiked
8772 Leaves linear lanceolate: lower ternate, Stem erect spiked
8773 Root creeping, Leaves linear close: lower 4, Calyx as long as capsule
8774 Leaves subulate channelled fleshy: lower 3, Stem panicled and corolla quite smooth
8775 Leaves linear smooth: lower 4, Stem erect panicled, Flowers in capitate spikes
8776 Leaves linear lanceolate: lower about 4 smooth, Flowers capitate, Calyxes hairy, Stem nearly simple
8777 Leaves linear scattered: lower opposite, Spur subulate, Flowers subsessile
8778 Leaves about 4 linear, Stem diffuse, Flowers racemose, Spur straight
8779 Leaves nearly linear: lower in fours, Calyxes pilose viscid, Fl. racemose, Spur straight, Stem erect
8780 Leaves nearly linear: lower in fours, Calyxes pilose viscid, Fl. racemose, Spur recurved, Stem erect
8781 Cauline leaves linear alternate: radical ovate lanceolate 3-5, Flowers corymbose
8782 Cauline leaves linear alternate: radical lanceolate 4, Cal. villous close to stem
8783 Leaves 5 linear fleshy, Flowers capitate
8784 Leaves linear channelled scattered upon the rootshoots in 5s, Calyx hairy, Pedunc. shorter than bractes
8785 Leaves 4 subulate fleshy, Stems erect, Flowers spiked
8786 Leaves 4 linear lanceolate glaucous, Stem diffuse, Flowers racemose, Spur straight
8787 Leaves all opposite villous, Stem simple, Flowers opposite lateral
8788 Leaves obovate opposite: floral alternate, Stem ascending pubescent, Spur straight
8789 Leaves mostly alternate lanceolate blunt, Stem much branched diffuse
8790 Leaves somewhat stem-clasping lanceolate scattered, Bractes longer than calyx, Stem ½ shrubby
8791 Leaves lanceolate hairy alternate, Flowers spiked: upper sepal very large
8792 Leaves alternate linear-subulate somewhat fleshy, Stem erect simple, Spike term. stalked
8793 Leaves lanceolate acuminate, Panicle twiggy flexuose
8794 Leaves linear alternate, Stem panicled twiggy, Flowers racemose
8795 Leaves lanceolate linear close, Stem erect, Spikes terminal sessile, Flowers imbricated

8796 Leaves alternate linear remote smoote smooth, Flowers racemose, Stem simple, Runners procumbent
8797 Leaves linear lanceolate alternate, Flowers racemose, Cal. longer than cor. Stem erect

8798 Very smooth, Radical leaves obovate lanceolate blunt serrate: cauline divided entire

8799 Leaves ovate serrated stalked, Peduncles axillary 1-flowered
8800 Leaves 4 linear lanceolate acute about 3-nerved smooth, Flowers racemose terminal with bractes
8801 Leaves oblong serrated, Stem erect herbaceous, Capsules 2-horned spreading

and Miscellaneous Particulars.

L. triphylla is a popular border annual. L. triornithophora is remarkable for the form of its flowers, which resemble three little birds seated in the spur.

L. vulgaris is a very shewy plant, but also a bad weed in sandy pastures.

1345. *Anarrhinum.* Named by Desfontaines, from α, privative, and ῥὶν, nose, in contradistinction to Antirrhinum, because the plants of this genus have not the snout-like flowers of the latter. Plants resembling Linaria in habit.

1346. *Nemesia.* A name used by Dioscorides to designate a kind of Antirrhinum, to which genus this is nearly related.

History, Use, Propagation, Culture,

1347. *Maurandya.* Named in honor of the lady of Dr. Maurandy, the botanical professor at Carthagena. An elegant greenhouse plant, native of Mexico, and flowering for months together in the summer.

1348. *Gerardia.* In honor of John Gerarde, our old English botanist, author of the Herbal, 1597, folio, and a great cultivator of exotic plants, of which he published a catalogue in 1596. These are handsome North American herbaceous plants, of such very difficult culture, that few persons have seen them in gardens. They deserve any pains which may be necessary to their successful cultivation.

1349. *Pedicularis;* of which the English word *lousewort* is a translation and explanation. The term lousewort is applied from a supposition that sheep which feed much on the plant become lousy; probably because the plants grow in very bad pastures, which may occasion the sheep to be in bad condition and to breed vermin. The species have their leaves very much cut, and that in a very regular manner. Their flowers are red, white, or yellow, and the mixture or shades of these three colors sometimes give the corolla the colour of fire. They grow in general at a considerable elevation; namely, more than a thousand toises above the level of the sea.

P. sceptrum Carolinum was so named by Rudbeck, in honor of Charles XII. It abounds in the north of Sweden and Lapland, where it was greatly admired by the traveller Dr. Clarke, who sent seeds of it to the Cambridge botanic garden, but they never came to any thing. The flowers grow in long whorled spikes, and

8802 Orifice of corolla pervious
8803 Orifice of corolla closed

8804 Leaves linear pinnatifid, Stem somewhat branching
8805 Stem oppositely much branched, Leaves linear, Flowers axillary opposite subsessile
8806 Branches panicled, Leaves linear, Peduncles axillary opposite longer than flower
8807 Pubescent, Stems nearly simple, Leaves subsessile lanceolate entire or toothed : lower pinnatifid cut
8808 Smooth, Stem panicled, Leaves stalked pinnatifid, Flowers axillary opposite stalked

8809 Stem branched, Lvs. pinnat. Pinnæ pinnatif. cut, Cal. inflated ovate 2-parted crest. Helmet blunt truncate

8812 Stem somewhat branched, Leaves pinnated, Pinnæ in 4s acutely pinnatifid, Helmet acute 2-toothed
8813 Stem nearly simple, Leaves lanc. toothed crenate, Cal. 2-fid truncate, Helmet acute
8814 Stem simple, Leaves pinnatifid, Pinnæ repand crenulate, Cal. 5-fid crested, Cor. closed
8815 Stem simple, Lvs. deeply pinnatifid, Pinnæ lanc. pinnatifid toothed, Spike compact leafy
8816 Stem simple, Cauline leaves deeply pinnatifid, Pinnæ lanc. acuminate pinnatifid toothed, Spike leafy
8817 Stem simple, Spike somewhat leafy, Helmet setaceous 2-toothed, Cal. truncate downwards
8818 Stem simple, Leaves deeply pinnatifid, Pinnæ unequally toothed linear-lanc. Calyxes villous 5-cleft
8819 Stem simple, Cauline lvs. deeply pinnatifid, Pinnæ lin. lanc. doubly toothed, Cal. round smooth 5-toothed
8820 Stem simple, Cauline leaves pinnatifid in fours, Pinnæ oblong blunt toothed, Spike capitate, Cal. hairy
8821 Stem simple, Lvs. pinnated, Pinnæ imbricated ovate blunt doubly toothed, Cal. 5-toothed, Helmet blunt
8822 Stem simple, Lvs. pinnated, Pinnæ deeply pinnatifid tooth. Cal. 5-fid somew. crested, Helmet uncinate
8823 Stem simple, Lvs. pinn. Pinnæ lanc. pinnatifid confluent at end, Spike capitate naked [acum. emargi.
8824 Stem simple, Lvs. pinnate, Pinnæ pinnatifid somewhat toothed, Spike leafy, Helmet two-toothed

8825 Leaves cæspitose spatulate deeply serrated smoothish, Peduncles terminal subcorymbose
8826 Smaller branched villous, Leaves bluntly serrated, Flowers racemose
8827 Leaves lanceolate oblong toothed, Segm. of limb entire
8828 Leaves lanceolate smooth serrated at end, Stem herbaceous, Segm. of limb bifid

8829 Leaves lanceolate acuminate smooth sessile, Pedunc. longer than flower
8830 Leaves oblong bluntish clammy sessile, Peduncles shorter than flower
8831 Procumb. Stem round rooting hairy, Lvs. cord.-ovate toothed 5-nerved, Pedunc. shorter than petioles
8832 Leaves ovate stalked, Stem square winged
8833 Leaves roundish ovate nerved; lower stalked, Stem creeping

8834 Leaves obovate entire at base, Calyxes spreading and peduncles smooth

8835 Raceme lax longer than the few-leaved stem, Calyxes pubescent in fruit increased in size

8836 Segments of cor. acute

8837 Segments of corolla blunt, Raceme comose

and Miscellaneous Particulars.

each represents a lion couchant. All the species are extremely difficult to keep in gardens. According to Sweet, they succeed best in peat soil and moist situations; the more tender species must be grown in pots in the same kind of soil, and should be protected under frames in severe weather: the best way of increasing them is by seed. (*Bot. Cult.* 404.)

1350. *Erinus.* A name under which Dioscorides describes an aquatic plant with a white flower, black seeds, and a milky stem. From the last circumstance it has derived its name; ερινεος signifying a wild fig tree. The plant of the ancients had no resemblance to that called Erinus by the moderns. Beautiful little alpine herbaceous plants, well adapted to rock-work in warm damp situations.

1351. *Mimulus.* From μιμω, an ape. The flower seeds in front resemble the face of a grinning monkey. The species are showy plants of the easiest culture in almost any soil or situation.

1352. *Hornemannia.* Named after Professor Hornemann, of Copenhagen, an eminent botanist, and the present editor of the Flora Danica. Little, inconspicuous, but curious annual plants.

1352. *Mazus.* From μαζος, a teat, on account of the little protuberances which close the mouth of the corolla. East Indian herbaceous plants, not unlike some kinds of Antirrhinum.

1354. *Isoplexis.* From ισος, equal, and πλεξις, segment, in allusion to the equal-sized divisions of the corolla.

History, Use, Propagation, Culture,

1355. *Digitalis.* Named by Fuchs, from *digitabulum*, a thimble, in allusion to the form of the flowers. The species are for the most part shewy border flowers of easy culture. D. purpurea, found both with purple and white flowers, is one of the most ornamental of native plants in rocky copses, neglected hedges, and by road sides. Its large tall spike attracts not only the botanist and florist, but is even conspicuous enough to be introduced in the painter's landscape of such scenery. It is a violent poison; but also a valuable plant in medicine. The leaves are the parts of the plant used. They should be gathered when the plant is in flower, and those only which are fresh selected. The leafstalks and midrib should be rejected, and the remaining part be dried either in the sunshine, or on a tin-pan or pewter dish before the fire, or the plant be hung up, each leaf separate, in a warm kitchen. Practitioners ought annually to obtain a supply of the recent leaves in the month of July, and dry them themselves; as in the herb-shops they are often so ill dried as to appear black, in which state they are useless. The powder should be kept in closely stopped opaque phials.

Digitalis is directly sedative and diuretic. It weakens the force of all the vital functions; and by a proper exhibition of it, the frequency of the pulse may be diminished any number of pulsations, and regulated at the pleasure of the practitioner; whilst at the same time it admits, to a certain extent, of the employment of such medicines as increase the firmness of the arterial action, and give tone to the habit. When given to the

8855 Lvs. cordate oblong flat crenate not downy, Raceme 1-sided, Cor. smooth, Segm. very blunt
8856 Half shrubby, Leaves linear lanc. entire smooth, Corollas ventricose

8857 Leaves cordate serrate acute rounded at base, Stem with blunt angles
8858 Leaves cordate 3-nerved, Stem with blunt angles
8859 Leaves cordate stalked decurrent blunt, Stem with membranous angles, Racemes terminal
8860 Lvs. ovate cord. smooth cut serrate with appendages at base, Petioles dilated, Racemes term. compound
8861 Lvs. obl. cord. hairy beneath doubly toothed with an appendage at base, Petioles equal, Racemes terminal
8862 Leaves cordate doubly serrate pubescent, Panicles terminal trichotomous with leaves between
8863 Lvs. obl. lanc. cord. doubly serrated smooth, Panicles racemose terminal 3-chotomous, Stem ½ shrubby
8864 Leaves cordate obl. toothed : teeth entire those at base deepest
8865 Leaves obl. lanc. deeply cordate finely and doubly serrated smooth, Pan. racem. term. Ped. 3-chotomous
8866 Lower lvs. tern. cord. cren. toothed ; upper entire, Fl. racemose panicled, Bractes ovate lanc. entire at end
8867 Leaves cordate 3-nerved pubesc. on each side, Petioles ciliated, Pedunc. and bractes with glandular hairs
8868 Leaves lanceolate serrated stalked : cauline in 3s ; and the branches opposite
8869 Lvs. lanc. narrowed at each end deeply unequally and doubly toothed smooth, Racemes terminal
8870 Lvs. somew. fleshy : upper sessile toothed smooth recurved at end, Pan. racem. Pedunc. bifid many-flow.
8871 Lvs. cord. doubly toothed : lower teeth bent backwards, Raceme terminal compound, Ped. 2-3-fl. altern.
8872 Leaves cordate pubescent doubly serrated, Panic. axillary dichotomous, Bractes ovate serrate
8873 Leaves cordate smooth doubly serrated, Panic. axillary dichotomous, Capsules acuminate
8874 Leaves smooth : lower ternate pinnate blunt ; upper simple, Pedunc. about 3-fl. axillary
8875 Leaves interruptedly pinnate cordate unequal, Raceme terminal, Pedunc. axillary twin dichotomous
8876 Lvs. obl. cord. lobed at edge naked as long as pet. Rac. term. comp. Branch. and ped. with glandular hairs
8877 Lvs. interruptedly pinnate oblong subcordate unequal at base, Panicle terminal, Peduncs. dichotomous
8878 Leaves pinnated, Leaflets oblong cut toothed, Panicle terminal, Peduncles dichotomous
8879 Leaves smooth : lower interruptedly pinnate ; upper ternate, Leaflets oblong, Flowers axillary
8880 Leaves pinnated, Raceme terminal naked, Peduncles bifid, Calyxes scarious
8881 Lower leaves bipinnate somewhat fleshy very smooth, Racemes bipartite
8882 Stems woody at base, Leaves bipinnatifid pubescent, Racemes long, Pedicels short villous
8883 Leaves bipinnate, Pinnæ acutely cut toothed, Panicle terminal, Peduncle dichotomous
8884 Lvs. smooth : rad. bipinnat. caul. pinnate, Panicle leafy, Ped. dichotomons, Lat. seg. of lower lip emargin.
8885 Leaves cordate lined shining, Pedunc. axillary 2-flowered, Stem hexangular

8886 Leaves roundish subsessile

and Miscellaneous Particulars.

full extent of which the system can admit, the pulse intermits, and vertigo, indistinct vision, and nausea, with vomiting or purging, occur ; and if, after these indications, the quantity be still increased, or if any considerable portion of the recent herb be inconsiderately swallowed, it produces delirium, hiccough, cold sweats, convulsions, syncope, and death. (*London Dispensatory*, 287.)

1356. *Scrophularia*. So named from the roots having a resemblance to *scrophulous* tumours, which they were, by the peculiar mode of induction of the dark ages, therefore supposed to cure. S. nodosa has the name of figwort from its knobbed roots : it has a rank smell like elder, and a bitter taste ; swine that have the scab are cured by washing them with a decoction of the leaves. Wasps resort greatly to the flowers. Goats eat the plant ; but cows, horses, sheep and swine refuse it.

The same observations apply to S. aquatica, which in French is called *Herbe du Siege*, because at the celebrated siege of Rochelle by Cardinal Richelieu in 1628, the garrison was reduced to the necessity of supporting life upon the roots of the plant.

1357. *Vandellia*. Louis Vandelli, a Portuguese, was professor of botany in the garden of Coimbra. He published in 1788, an essay on the plants of Portugal and Brazil, a work which is little known, on account of its extreme rarity.

History, Use, Propagation, Culture,

1358. *Sibthorpia.* In honor of Humphry Sibthorp, M. D., professor of botany at Oxford, who travelled into Greece, for the purpose of collecting materials for a classical Flora Græca, in which he succeeded even beyond his own hopes. After his death the publication of his materials was confided to Sir James Edward Smith, under whose care the work has reached to five hundred figures in folio, of the most magnificent kind; five hundred more have yet to be published. A little trailing plant.

1359. *Limosella.* From *limus*, mud. The plant grows by the edge of puddles and in muddy places.

1360. *Browallia.* Named by Linnæus, in honor of John Browallius, bishop of Aboa, who defended the sexual system against Siegesbeck, in a book entitled Examen epicriseos, &c., Aboa, 1739, octavo. Handsome plants with blue flowers, often cultivated as tender annuals.

1361. *Stemodia.* From στημων, a stamen, and δις, double. Each of the stamens supports two anthers.

1362. *Trevirana.* Named after Dr. Treviranus, a German botanist. This beautiful plant, which is commonly called Cyrilla pulchella, is one of the prettiest of the old inhabitants of the stove.

1363. *Columnea.* In honor of Fabius Columna, or Fabio Colonna, of the noble family of Colonna in Italy, born in 1567. He published his Phytobazanos in 1592, and his Ecphrasis in 1606, both works of high reputation in their day. One species, C. scandens, is common in hothouses, where it is cultivated for the neatness of its foliage and the beauty of its scarlet blossoms.

8887 Leaves reniform subpeltate crenate

8888 Leaves lanceolate spatulate, Scapes shorter than leaf

8889 Peduncles 1-flowered
8890 Peduncles 1 many-flowered

8891 Leaves opposite and ternate stalked
8892 Leaves opposite and ternate stem-clasping

8893 Leaves ternate ovate hairy

8894 Leaves ovate acute entire subvillous, Sepals entire and corollas pubescent, Upper lip undivided
8895 Leaves ovate acuminate serrate hairy above, Sepals toothletted and corollas hairy
8896 Leaves 3 subsessile oblong acutely crenate pubescent, Cor. hairy, Galea dilated reflexed

8897 Leaves ovate acuminate stalked, Raceme terminal whorled, Peduncles cymose

8898 Leaves linear smooth entire, Stem nearly naked

8899 Leaves oblong ovate entire 3-nerved sessile, Pedunc. axillary 1 flowered, Stem procumbent

8900 Leaves oblong entire, Peduncles longer than leaf, Stem declinate
8901 Very smooth, Leaves cuneate oblong upwards obsoletely crenate, Pedunc. nearly as long as leaf
8902 Stem erect, Leaves lanceolate acute doubly serrated smooth, Flowers whorled

8903 Leaves ovate serrated alternate, Flowers twin
8904 Hairy, Leaves alternate rhomboid cuneiform cut serrate, Flowers twin, Sepals linear
8905 Leaves opposite linear entire, Racemes compound terminal
8906 Leaves opposite ovate-oblong entire wavy: upper subcordate whorled, Racemes spiked
8907 Pubescent, Leaves opposite and ternate ovate serrate stalked, Pedunc. axillary shorter than petiole

8908 Leaves toothed lanceolate 3-nerved

8909 Leaves opposite ovate jagged, Flowers somewhat umbelled terminal
8910 Leaves linear toothed villous, Cal. hairy, Branches subfastigiate

8911 Upper leaves opposite sessile tooth-sinuated, Flowers solitary on long stalks
8912 Leaves opp. lin. lanc. acute at each end toothletted, Raceme terminal, Stamens exserted
8913 Leaves lanc. toothed villous, Racemes of flowers remote
8914 Leaves obovate crenate downy, Stem decumbent
8915 Leaves obl. serrated hairy, Stem nearly leafless, Flowers alternate remote
8916 Leaves ovate toothed silky beneath dotted with silver, Flowers axillary stalked
8917 Leaves wedge-shaped serrated pubescent, Segm. of cor. with very long points
8918 Leaves opp. stalked oblong blunt tooth-serrated when old smooth, Segm. of cor. rounded

and Miscellaneous Particulars.

1364. *Russelia.* In honor of Alexander Russel, M. D. F. R. S., born in Scotland; died 1768; author of the natural history of Aleppo, London, 1756. His brother Patrick, published a second edition in 1794, and a work on serpents in 1796, folio.

1365. *Dodartia*, by Tournefort, after M. Dodart, member of the academy of sciences at Paris; and an eminent physician. An ugly, leafless, almost flowerless plant, of much rarity and little beauty.

1366. *Lindernia.* Named after Francis Lindern, an obscure Swiss botanist. Pyxidaria is so called from πυξος, the box, which it resembles in foliage.

1367. *Herpestis.* From ἑρπυζης, any thing which creeps. An exotic genus of herbs, with opposite leaves and axillary flowers, each of whose stalks bears a pair of bracteæ. Herpestis Monnieria is a beautiful aquatic.

1368. *Capraria.* So named from *capra*, a goat, the leaves being much liked by that animal.

1369. *Buchnera.* Named after John Godfrey Buchner, a German botanist, who published in 1743, his Observations upon the Plants of Saxony. Small Cape shrubs of little interest or beauty. Their leaves are generally small, and their flowers white.

1370. *Manulea.* Derived from *manus*, the hand. The five divisions of the flower, in some species, from their form and relative position, resemble an open hand. Handsome Cape shrubs of humble growth. They are rare in collections, but deserving of being very generally cultivated.

History, Use, Propagation, Culture,

1371. *Angelonia.* *Angelon* is the name of the plant among the Spanish colonists of Caraccas, where it grows. A very beautiful stove herbaceous plant, with large light-blue flowers.

1372. *Schizanthus.* From σχιζω, to cut, and ανθος, a flower, in allusion to the numerous divisions of the beautiful purple and yellow flowers. Tender annual plants, with finely cut pale green leaves, and terminal panicles of elegant flowers.

1373. *Besleria.* After Basil Besler, an apothecary at Nuremberg, joint editor with Jungermann, of a sumptuous work entitled Hortus Eystettensis, 1613. The garden belonged to Bishop Conrad, of Eichstedt, and the plates were engraved at his expense.

1374. *Teedia.* So named by Persoon, but the meaning is unknown. Pretty herbaceous plants, with bright purple flowers and dark berries.

1375. *Brunsfelsia.* In memory of Otho Brunsfels, of Mentz, a Carthusian monk, and afterwards a physician, author of Figures of Plants in 1530. He died in 1534. The species are handsome tropical shrubs, with neat foliage and shewy white or purple flowers. Cuttings with a little ripened wood strike root freely in heat.

8919 The only species

8920 The only species

8921 Peduncles branched, Leaves ovate
8922 Peduncles simple clustered, Leaves ovate-lanceolate serrated
8923 Peduncles simple solitary, Calyxes serrated, Cor. smooth with a serrulated limb
8924 Leaves obl. ovate rugose crenate decurrent down the petiole, Cal. serrulate colored
8925 Peduncles simple solitary, Calyxes colored serrated, Cor. hairy with an entire limb, Leaves ovate

8926 Leaves opp. obl. finely serrulate smooth
8927 Leaves downy

8928 Leaves ovate-lanceolate narrowed at each end, Tube of cor. curved, Limb wavy
8929 Leaves obovate acuminate longer than petiole, Tube of cor. straight, Limb entire

8930 Leaves and leafstalks deeply stained with purple

8931 Cauline leaves bipinnate
8932 Rad. leaves lyrate: upper oblong, Pedicels longer than bractes, Sepals linear entire
8933 Radical leaves lyrate: upper ovate, Bractes longer than pedicels, Sepals linear oblong entire
8934 Radical leaves lyrate: floral cordate half stem-clasping, Peduncles as long as flower
8935 Radical leaves lyrate: upper oblong, Flowers subsessile the length of bractes, Cal. ovate serrated
8936 Somewhat downy, Leaves lanceolate, Flowers axillary solitary
8637 All over wool, Leaves oval oblong blunt crenate, Stamens bearded with capitate hairs

8938 Leaves ovate lanceolate deeply serrated
8939 Leaves ovate acute cut serrated

8940 Leaves ternate remotely toothletted
8941 Leaves ovate acute serrated, Stem winged at angles

8942 Leaves obovate smooth, Segments of cor. length of tube
8943 Leaves obovate dotted with glands downy

8944 Flowers large yellow spotted

and Miscellaneous Particulars.

1376. *Celsia.* In honor of Olaus Celsius, D. D., surnamed the northern Pliny, professor of the oriental languages in the university of Upsal. His Hierobotanicon, or History of the Plants of Scripture, appeared in 1745. There was also another Swedish botanist called Magnus Nicolaus Celsus, who died in 1679. Besides these moderns, the name is rendered familiar to classical scholars by the recollection of the famous Aurelius Cornelius Celsus, who wrote upon agriculture and medicine, and whose purity of style procured him the name of the Cicero of medicine.

1377. *Alonsoa.* Named by the authors of the Flora Peruviana, after Zanoni Alonso, at the time of the publication of that work, Spanish secretary for the kingdom of Santa Fé, and a great patron of objects connected with natural history. Sir James Smith considers the genus the same as Hemimeris.

1378. *Anthocercis.* From ανθος, a flower, and κερκις, a ray, the narrow divisions of the corolla spreading in a radiant manner, like the spokes of a wheel.

1379. *Cymbaria.* From κυμβη, a boat, in allusion to the shape of the fruit. A small pubescent hoary plant, native of mountainous rocky places in Siberia.

Class XV. — TETRADYNAMIA. Stamens 6, of which four are longer than the rest.

This class consists, with the exception of Cleome, entirely of the natural order Cruciferæ, and has lately been the subject of the most acute and successful investigation of many botanists of celebrity. Our countryman, Mr. Brown, led the way to the improvements which have been made in the genera, in the second edition of the Hortus Kewensis, in which, discarding the uncertain and unnatural characters derived from variations in the floral envelopes, he took a new course, and by indicating with great precision the curious modifications of the seeds and seed-vessels, led the way to an entirely new arrangement of the class. The principles thus developed have been adopted by M. Decandolle, whose learned treatise upon Cruciferæ is here followed without variation.

The difference between the genera with a long pod (*Siliquosæ*), and those with a short one (*Siliculosæ*), has given rise to two orders in the Linnean system. But these are not only ambiguous, but interfere so much with a distribution of the genera according to their natural affinities, that they have been rejected here, and the divisions of M. Decandolle, depending upon variation in the relative position of the various parts of the seed, have been substituted.

The plants of this class have always been celebrated for their antiscorbutic qualities. These seem to reside in an acrid, oily, volatile principle, not yet determined by chemists, and varying in the degree of abundance in which it is found in different species. It is particularly abundant in the seeds of mustard and garden rocket, in the roots of the horse radish, and in the foliage of the Lepidium latifolium, which, administered inwardly, act powerfully upon the gastric organs, or, applied externally, inflame the skin and operate nearly as severely as blisters. A slighter degree of acrimony is found in the foliage of the scurvy grass, the roots of the garden radish, &c.; and these, therefore, operate more gently, and perhaps more safely, when eaten, scarcely at all when applied outwardly. Whatever the degree of acrimony may be in these plants, they all appear, when eaten, to produce some specific action upon the digestive organs, and thence upon scorbutic humours; for which reason, the horse radish, water-cress, radishes, and even cabbages are eminently antiscorbutic. They are also admitted by physicians as diuretic, sialagogue, and diaphoretic. It is only when the acrid principle is diffused over a considerable quantity of fleshy and watery substance, that cruciferous plants become eatable, as in the leaves and stems of cabbages and sea-kail, and in the roots of radishes and turnips. Even in these plants, the proportion of acrid principle is much diminished by exclusion from light. Plants of this class are also remarkable for containing a larger quantity of azote than most vegetables; for which reason ammonia is generally evolved in their fermentation or putrefaction: to which circumstance it is possible that the two remarkable phœnomena are to be attributed, viz.; that cruciferous plants contain a greater portion of nutritive matter than most herbaceous plants; and that they require either a very rich soil manured with animal substances, or at least a situation near the habitations of men. The embryos of all these plants are filled with oil, and the seeds of Camelina sativa, Brassica campestris, some species of Rocket, &c. are cultivated in many parts of Europe for the sake of their expressed oil, which is used either for culinary purposes or for lamps.

Cruciferous plants are chiefly natives of temperate climates, those which are found within the tropics being in all cases mountain plants, and are nearly all cultivable in the open air; they are mostly found in open sandy plains; some on the tops of the highest mountains at the utmost limits of vegetation. Nine hundred species are now described, of which not more than twenty-two are to be found in the works of Hippocrates, Theophrastus, Dioscorides, or Pliny.

A. *Cotyledons four, spirally twisted. Petals 4, cruciate.*

1380. *Schizopetalon.* Petals pinnatifid.

B. *Cotyledons two. Petals 4, cruciate.*

1. *Cotyledons flat, accumbent. Radicle lateral. Seeds compressed.* (O=) Pleurorhizeæ, *Dec.*

* *Silique opening; with a linear dissepiment more or less wide than seeds. Seeds oval, compressed; often margined. Cotyledons flat, accumbent, parallel with the dissepiment.* Arabideæ, *Dec.*

1381. *Mathiola.* Silique roundish. Stigmas connivent, thickened or cornute at back. Calyx bisaccate at base.

1382. *Cheiranthus.* Silique round or compressed. Stigmas 2-lobed or capitate. Calyx bisaccate at base.

1383. *Nasturtium.* Silique roundish, shortened or declinate. Stigma nearly 2-lobed. Calyx equal at base, spreading.

1384. *Leptocarpæa.* Silique roundish, very slender. Stigmas sessile, 2-lobed. Calyx spreading, equal.

1385. *Notoceras.* Silique 4-cornered, 2-edged, the valves elongated at end into a horn or mucro.

1386. *Barbarea.* Silique 4-cornered, 2-edged, the valves not elongated at end. Calyx equal at base.

1387. *Braya.* Silique oblong, subcylindrical, with flattish valves and a sessile stigma. Seeds few, ovate. Calyx equal at base.

1388. *Parrya.* Silique linear with veiny valves. Seeds in two rows, with a loose wrinkled skin. Stigmas approximating Filaments not toothed.

1389. *Turritis.* Silique linear with flat valves. Seeds in two rows in each cell.

1390. *Arabis.* Silique linear with flat valves, 1-nerved in the middle. Seeds in one row in each cell.

1391. *Macropodium.* Silique pedicellate, linear, with flat valves, 1-nerved in middle.

1392. *Cardamine.* Silique linear with flat nerveless valves, often opening with elasticity. Funicles of the hilum slender.

1393. *Pteroneuron.* Silique lanceolate with flat nerveless valves, often opening with elasticity: placentas with winged nerves. Funicles dilated.

1394. *Dentaria.* Silique lanceolate with flat nerveless valves, often opening with elasticity: placentas not winged. Funicles dilated.

** *Silicle opening lengthwise, with a broad oval membranous dissepiment, and flat or concave valves. Seeds compressed, frequently margined. Cotyledons flat, accumbent, parallel with the dissepiment.* Alyssineæ, *Dec.*

1395. *Lunaria.* Silicle pedicellate, elliptical or lanceolate with flat valves. Funicles long, adhering to the dissepiment. Calyx somewhat bisaccate. Petals nearly entire. Stamens not toothed.

1396 *Ricotia.* Silicle sessile, oblong, when ripe losing its dissepiment and becoming 1-celled: valves flat. Calyx with two prominences at base. Petals emarginate. Stamens not toothed.

1397. *Farsetia.* Silicle sessile, oval or orbicular, with flat valves. Seeds winged. Calyx bisaccate at base. Petals entire.

1398. *Berteroa.* Silicle sessile, elliptical or obovate, with flat or concave valves. Calyx equal at base. Petals 2-parted. The small stamens toothed.

1399. *Aubrietia.* Silicle oblong with convex valves. Seeds not edged. Calyx bisaccate at base. Petals entire. Smaller stamens toothed.

1400. *Vesicaria.* Silicle globose inflated with hemispherical valves. Seeds more than 8. Petals entire.

1401. *Alyssum.* Silicle orbicular or elliptical, with valves flat or convex in centre. Seeds 2-4 in each cell. Calyx equal at base. Petals entire. Some the stamens toothed.
1402. *Clypeola.* Silicle orbicular, 1-celled, 1-seeded, with flat valves. Calyx equal. Petals entire. Stamens toothed.
1403. *Peltaria.* Silicle orbicular, 1-celled, 1-4-seeded, with flat valves. Seeds two in each cell: funicles adhering to the dissepiment.
1404. *Petrocallis.* Silicle sessile, oval, with flattish valves. Seeds two in each cell: funicles adhering to the dissepiment.
1405. *Draba.* Silicle sessile, oval or oblong, with flat or convex valves. Seeds many, not edged. Calyx equal. Petals entire. All the stamens without teeth.
1406. *Erophila.* Silicle oval or oblong, with flat valves. Seeds many, not edged. Calyx equal. Petals 2-parted. Stamens without teeth.
1407. *Cochlearia.* Silicle sessile, ovate-globose or oblong, with ventricose valves. Seeds many, not edged. Petals entire. Stamens without teeth.

**** Silicle opening, with a very narrow dissepiment, and keeled navicular valves. Seeds oval, sometimes margined. Cotyledons flat, accumbent, contrary to the dissepiment.* THLASPIDEÆ, *Dec.*

† Cells of silicle 2-many-seeded.

1408. *Thlaspi.* Silicle emarginate at end, with navicular valves, winged at back. Cells two, many-seeded.
1409. *Capsella.* Silicle triangular, cuneate at base, with navicular valves, not winged. Cells many-seeded.
1410. *Hutchinsia.* Silicle elliptical, with navicular valves, not winged. Cells 2-seeded, rarely many-seeded.
1411. *Teesdalia.* Silicle oval, emarginate at end, with navicular valves and 2-seeded cells. Stamens having a scale inside at their base.

†† Cells of silicle 1-seeded.

1412. *Iberis.* Two outer petals largest. Silicle compressed, truncate, emarginate.
1413. *Biscutella.* Silicle flat, biscutate, with the cells laterally united to the axis. Style long, persistent. Embryo inverted.

***** Silicle not opening, with concave indistinct valves, and sometimes with scarcely any trace of a dissepiment. Seeds oval, very few. Cotyledons flat, accumbent, parallel with dissepiment.* EUCLIDIEÆ, *Dec.*

1414. *Euclidium.* Silicle drupaceous, ovate, with manifest sutures. Style subulate. Cells 1-seeded.
1415. *Ochthodium.* Silicle coriaceous, subglobose. Stigma sessile. Dissepiment thick. Cells 1-seeded.

****** Silicle opening lengthwise, with concave valves, bearing internally transverse horizontal dissepiments separating the seeds. Seeds not margined. Cotyledons flat, accumbent, parallel with the dissepiment.* ANASTATICEÆ, *Dec.*

1416. *Anastatica.* Silicle ventricose, with valves bearing an appendage outside at the end.

******* Silique or silicle separating across into 1-2-celled, 1-2-seeded joints. Seeds not edged. Cotyledons flat, accumbent, parallel with the dissepiment when there is any.* CAKILINEÆ, *Dec.*

1417. *Cakile.* Silicle 2-jointed, compressed: the upper joint ensiform. Seeds solitary in the cells: upper erect; lower pendulous.
1418. *Rapistrum.* Silicle 2-jointed: the upper joint ovate, rugose. Seeds solitary in the cells: upper erect, lower pendulous.
1419. *Chorispora.* Silique roundish, with many equal joints. Seeds all pendulous.

2. *Cotyledons flat, incumbent. Radicle dorsal. Seeds ovate, not margined.* (O||) NOTORHIZEÆ, *Dec.*

** Silicle 2-celled, opening lengthwise, with concave or keeled valves. Seeds ovate or oblong, not margined. Cotyledons flat, incumbent, contrary to the dissepiment.* SISYMBRIEÆ, *Dec.*

1420. *Malcomia.* Silique roundish. Stigma simple much pointed.
1421. *Hesperis.* Silique roundish, or about 4-cornered. Stigmas 2, erect, conniving. Calyx bisaccate at base.
1422. *Sisymbrium.* Silique roundish, sessile upon the torus. Stigmas 2, somewhat distinct or connate in a head. Calyx equal at base.
1423. *Alliaria.* Silique roundish, 4-cornered, with prominent nerves. Calyx lax.
1424. *Erisymum.* Silique 4-cornered. Calyx closed.

*** Silicle with concave valves, and with a dissepiment elliptical in its greatest diameter. Seeds ovate. Cotyledons flat, incumbent, contrary to dissepiment.* CAMELINEÆ, *Dec.*

1425. *Camelina.* Silicle obovate or subglobose, with ventricose valves and many-seeded cells. Style filiform.
1426. *Neslia.* Silicle subglobose, with concave valves, 1-celled, 1-seeded, indehiscent.

**** Silicle with a very narrow dissepiment, and with keeled or very convex valves. Seeds solitary or few in the cells, ovate, not margined. Cotyledons flat, incumbent, parallel with the dissepiment.* LEPIDINEÆ, *Dec.*

1427. *Coronopus.* Silicle twin. Valves ventricose or subcarinate, scarcely dehiscent, 1-seeded.
1428. *Lepidium.* Silicle ovate or subcordate, with carinate or rarely ventricose valves, opening with 1-seeded cells.
1429. *Æthionema.* Silicle oval, generally emarginate, with navicular valves, and 1-2-seeded cells. Larger stamens either united or toothed.

***** Silicle with indistinct or indehiscent keeled valves, 1-celled, 1-seeded, with an obliterated dissepiment. Seeds ovate, oblong. Cotyledons flat, incumbent, apparently in the same direction as the dissepiment should be.* ISATIDEÆ, *Dec.*

1430. *Isatis.* Silicle elliptical, flat, 1-celled, 1-seeded, with carinate navicular valves, which are scarcely dehiscent.
1431. *Myagrum* Silicle compressed, almost cuneate, with two empty hollows at end, and at base 1-celled, 1-seeded.

3. *Cotyledons incumbent, folded together, or plaited lengthwise through their middle, and enwrapping the radicula. Style generally enlarged, with a cell and seed at its base. Seeds generally globose, never margined.* (O>>) ORTHOPLOCEÆ, *Dec.*

** Silique with valves opening lengthwise, and a linear dissepiment. Cotyledons folded together.* BRASSICEÆ, *Dec.*

1432. *Brassica.* Silique roundish. Style small, short, obtuse. Seeds in one row. Calyx closed.
1433. *Sinapis.* Silique roundish, with nerved valves. Style small, short, acute. Seeds in one row. Calyx spreading.
1434. *Moricandia.* Silique 4-cornered, sowewhat 2-edged. Seeds in two rows. Calyx bisaccate at base.
1435. *Diplotaxis.* Silique compressed, linear. Seeds in two rows. Calyx equal at base.
1436. *Eruca.* Silique roundish. Style large, ensiform or conical. Seeds in one row. Calyx equal at base.

** *Silicle with concave valves, opening lengthwise, with an elliptical dissepiment. Cotyledons folded together.* Velleæ, *Dec.*

1437. *Vella.* Larger stamens connate. Style ovate, flat, at the end of a tongue-shaped silicle.
1438. *Carrichtera.* Stamens all free. Style ovate, flat, foliaceous.
1439. *Succowia.* Stamens all free. Style slender, conical. Valves of the silicle echinate.

*** *Silicle indehiscent, ovate or globose, 1-celled, 1-seeded, with indistinct valves. Seeds globose. Cotyledons folded together.* Zilleæ, *Dec.*

1440. *Zilla.* Silicle 2-celled. Cells 1-seeded.
1441. *Calepina.* Silicle 1-celled, 1-seed. Seed pendulous. Outer petals rather the largest.

**** *Silicle or silique dividing across into one or few-seeded joints or cells. Seeds globose. Cotyledons folded together.* Raphaneæ, *Dec.*

1442. *Crambe.* Silicle with two joints, of which the lower is abortive, the upper globose 1-seeded.

History, Use, Propagation, Culture,

1380. *Schizopetalon.* A curious genus of Chilian plants, with pinnatifid petals, whence the name has been formed, from σχιζω, to divide. A plant of difficult cultivation. It is raised from seeds, which it produces sparingly, and only in a well-aired cool greenhouse.

1381. *Mathiola.* Named after Peter Andrew Matthioli, an Italian physician, born in 1500, died in 1577. He was first physician to Ferdinand of Austria, and author of a laborious commentary upon Dioscorides. Herbs, or rarely shrubs, nearly all covered with a white stellate soft down. M. incana, annua, græca, and fenestralis are popular border flowers, especially the first; the leaves of all the species, and also of Cheiranthus, and many other plants of this class, may be used as potherbs or salads.

1382. *Cheiranthus.* So called from the Arabic *khcyry*, the name of a plant with red sweet-scented flowers. Herbs, or occasionally shrubs, with entire or toothed leaves, and flowers of various colors. C. Cheiri is a

1443. *Raphanus.* Silique transversely many-celled or dividing into several joints.

4. *Cotyledons incumbent, linear, spirally or rather circinately twisted.* (O|||) SPIROLOBEÆ, *Dec.*

1444. *Bunias.* Silicle nucamentaceous, indehiscent, 2-4-celled. Cotyledons twisted spirally.

1445. *Erucaria.* Silique lomentaceous, 2-jointed; the lower joint having two cells, the upper being ensiform. Cotyledons replicate, somewhat spiral.

5. *Cotyledons incumbent, linear, with two legs, or a double plait, that is to say, plaited twice crosswise. Seeds depressed.* (O||||||) DIPLECOLOBEÆ, *Dec.*

1446. *Heliophila.* Silique elongate or rarely oblong or oval. Dissepiment linear or oval. Valves flat, or in the long siliques somewhat convex. Calyx equal at base.

1447. *Subularia.* Silicle oval. Dissepiment elliptical. Valves convex. Cells many-seeded. Stigma sessile.

C. *Cotyledons* 2. *Petals* 4, *not cruciate. Thalamus large, hemispherical or elongated. Stamens* 4-6-00.

1448. *Cleome.* A honey gland at each division of the calyx, except the lowest. Calyx 4-leaved. Petals ascending.

8945 Stem weak cœsious, Petals pinnatifid quickly perishable

8946 Stem shrubby at base erect branched, Leaves lanceolate entire hoary, Pods subcylind. without glands

8947 Stem herbaceous erect branched, Leaves lanceolate blunt hoary, Pods subcylindrical without glands
8948 Stem half shrubby erect branched, Leaves lanceolate smooth, Pods somewhat compressed without glands
8949 Stem herbaceous erect branched, Leaves lanceolate smooth, Pods somewhat compressed without glands
8950 Stem ½ shrubby erect simple, Leaves close obovate downy, Pods downy without glands broadest at base
8951 Stem somewhat erect herbaceous branch. Lvs. obl. downy; lower sinuated, Pods comp. velvety and gland.
8952 Stem erect branched, Leaves downy or pubescent toothed or pinnatifid, Pods compressed downy
β Pods twice as short as α
8953 Stem erect nearly simple naked, Leaves linear blunt hoary entire, Flowers subsessile, Pods compressed
8954 Stem ½ shrubby at base branched erect, Leaves downy linear entire or toothed, Fl. subsess. Pods roundish
8955 Stem suberect branched, Leaves sinuate pinnatifid, Pods with three acute nearly equal points
8956 Stem suberect branched, Leaves downy lanceolate repand toothed, Fl. sessile, Middle point of pod longest

8957 Leaves lanc. entire, Hairs 2-parted appressed or none, Pods linear, Stigmas with recurved lobes

8958 Lvs. obl. lanc. somew. toothed, Hairs 2-parted or none, Stem decum. branch. Pet obov. Pods erect pointed
8959 Leaves linear entire somewhat silky, Stem half shrubby
8960 Leaves linear-lanceolate acuminate finely serrated downy with 2-parted hairs, Stem shrubby branched

8961 Leaves linear-lanceolate acuminate entire downy with appressed 2-parted hairs, Stem shrubby branched

8962 Leaves lin. lanc. entire roughish, Stem shrubby branched, Pods compressed, Pedic. half as short as calyx

8963 Leaves linear entire rough clustered, Stem shrubby branched, Pods roundish 3 times as long as calyx

8964 Leaves pinnatifid, Segments ovate subcordate repand
8965 Leaves pinnatifid, Segments lanceolate serrate or cut
8966 Leaves pinnated-lobed, lobes confluent toothed smooth, Root fusiform, Petals as long as calyx
8967 Downy, Rad. lvs. toothed backwards, cauline sagittate oblong blunt, Stems erect branched from the base
8968 Radical leaves stalked obovate toothed or lyrate: upper pinnatifid, Lobes linear entire

and Miscellaneous Particulars.

popular flower of long standing, admired for its various colors and agreeable odor. Being an acrid and hardy evergreen, it is sometimes sown in pastures, along with parsley, thyme, &c. as a preventative of the rot in sheep.

1383. *Nasturtium*, is said to have been so called from the effect its acrimony produces upon the muscles of the nose; *nasus tortus* signifying a convulsed nose. *Pliny.* N. officinale is a well known popular salad, gathered wild in most parts where it is found, and since 1808, cultivated to a considerable extent in the neighbourhood of London. A running stream of clear water is essential to its cultivation; in the bed of this stream the plants are inserted in rows in the direction of the current, and all that is necessary is to take up and replant occasionally, and to keep up the plants free of mud or any accumulation of extraneous matters, and to see that other plants, especially the Sium nodiflorum, a poisonous plant resembling the water-cress, do

History, Use, Propagation, Culture,

not find their way into the plantation. Near Rickmansworth, in Hertfordshire, there is a fine stream of water on a chalky bottom, in which one cultivator grows five acres, and sends a supply to London every day in the year, Sundays excepted. There are also large plantations at Uxbridge, Gravesend, and other places.

Some market-gardeners, who can command a small stream of water, grow the water-cress in beds sunk about a foot in a retentive soil, with a very gentle slope from one end to the other. Along the bottom of this bed, which may be of any convenient length and breadth, chalk or gravel is deposited, and the plants are inserted about six inches distance every way. Then, according to the slope and length of the bed, dams are made six inches high across it, at intervals; so that when these dams are full, the water may rise not less than three inches on all the plants included in each. The water, being turned on, will circulate from dam to dam; and the plants, if not allowed to run to flower, will afford abundance of young tops in all but the winter months. A stream of water no larger than what will fill a pipe of an inch bore, will, if not absorbed by the soil, suffice to irrigate in this way an eighth of an acre. As some of the plants are apt to rot off in winter, the plantation should be laid dry two or three times a year, and all weeds and decayed parts removed, and vacancies filled up. Cress grown in this way, however, is far inferior to that grown in a living stream flowing over gravel or chalk.

The water-cress has lately been cultivated in the neighbourhood of Paris, and also near Edinburgh.

1384. *Leptocarpæa.* From λεπτος, slender, and καρπον, fruit. A genus distinguished from Sisymbrium by its accumbent cotyledons.

8969 Radical leaves stalked obovate or lyrate, Cauline amplexicaul pinnatifid, Lobes linear entire
8970 Leaves obl. lanc. pinnatifid or serrated, Root fibrous, Petals larger than calyx, Silicules ellipsoid
8971 Leaves obovate cuneate toothed at end, Pods roundish subturgid, Bractes a little shorter than pods
8972 Lvs. smooth : rad.stalked pinnatif.; caul. stem-clasping cut serr. Pods roundish, Pedic. bracteate very short
8973 Lvs. ovate lanc. toothed backwards acuminate at each end smooth, Pods roundish 4 times as long as stalk

8974 The only species. Leaves stalked pinnatifid sublyrate with cut toothed acuminate lobes

8975 Pods 2-horned, Petals equal, Leaves entire, Hairs strigose fixed by their middle 2-parted appr. scattered
8976 Pods 2-horned, Petals unequal, Leaves ent. Hairs strigose fixed by their middle 2-parted very numerous

8977 Lower leaves lyrate : terminal lobe roundish ; upper obovate toothed
8978 Lower leaves lyrate : terminal lobe ovate ; upper pinnatifid with linear oblong entire lobes
8979 Radical and lower leaves pinnatifid-lyrate : lateral lobes ovate ; terminal cordate entire
8980 Lower leaves toothed lyrate : lateral lobes dentiform ; terminal very large subcordate, upper ovate

8981 Leaves linear narrowed at base smooth acute

8982 Pods lin.-oblong, Anthers oval, Leaves entire, Peduncles smooth

8983 Rad. leaves toothed hairy : cauline stem-clasping entire smooth, Pods erect 6 times as long as stalk

8984 Cauline lvs. cord. stem-clasping rough with 3-parted down, Pedicels shorter than cal. Stigma somew. emarg.
8985 Leaves many-toothed villous with branched hair lanc. acute : rad. somew. stalked ; caul. cord. stem-clasp.
8986 Leaves few-toothed hoary with branched hairs : rad. obov. oblong ; cauline cordate sagitt. stem-clasping

8987 Lvs. pubesc. with minute stellate down : rad. obl. stalked sinuate toothed ; cauline sagittate lanceol. entire
8988 Lvs. somew. toothed rough with branch. hair : lower oval narr. into a stalk ; cauline bluntly cord.-auricled
8989 Lvs. somew. toothed rough with branch. hair : lower oval narr. into a stalk ; cauline acutely cord.-auricled
8990 Lvs. acutely toothed lanc. stem-clasping wavy rough with branching hairs : rad. narrowed into the stalk
8991 Lvs. somew. toothed rough : rad. ovate or obl. narrowed into the stalk ; cauline lanceol. sagittate cordate
8992 Lvs. toothed rough with generally branched hairs : radical obov. obl. narr. into the stalk ; caul. ovate lanc.
8993 Lvs. smooth : radical ovate-oblong somewhat toothed narrowed at base ; cauline sessile ovate serrated

8994 Leaves hairy with branched pubescence : radical spatulate bluntly toothed ; cauline ovate acutely toothed
8995 Leaves rough with scattered bifid down : radical obov. toothed ; cauline obl. nearly entire, Raceme erect
8996 Leaves somewhat toothed smooth ciliated : radical subsessile oval oblong ; cauline oblong, Raceme erect
8997 All the lvs. sessile somew. toothed hoary with branched hairs : radical obov. obl. ; cauline obl. Rac. erect
8998 Leaves hairy somewhat toothed : radical stalked ovate oblong, Stem branched, Pods ascending
8999 Leaves nearly entire rough with branched hairs : radical and caul. oval narrowed at base, Raceme lax
9000 Lvs. pubesc. coarsely toothed : rad. spatulate lanc. narrowed into the stalk ; caul. lanc. Pods pubescent
9001 Leaves oblong acute sessile entire smooth, Stems strigose, Runners creeping, Pods spreading
9002 Leaves nearly smooth : radical cut ; cauline oblong linear entire, Stem generally branched
9003 Rad. leaves lyrate pinnatifid smooth or ciliated : cauline linear, Stem hispid at base somewhat branched
9004 Lvs. vill. with forked down : rad. lyrate pinnat. ; caul. cut toothed, Stem branched hisp. with simple hairs

and Miscellaneous Particulars.

1385. *Notoceras.* From νωτος, the back, and κερας, a horn. The structure of the pod of this genus is intermediate between Erysimum and Capsella. The species are small annuals, with very minute flowers, which are sometimes apetalous.

1386. *Barbarea.* A name used by Dodoens, because the plant had been called the herb of St. Barbara by some preceding botanists. B. vulgaris is sometimes cultivated as a spring salad, but is much less delicate than the common cress, and has nothing in flavor to recommend it. B. præcox, the American or Belleisle cress of gardeners, is preferred to the other, and cultivated in a number of gardens.

1387. *Braya.* A curious little plant, with the habit of Arabis cærulea. Leaves are linear, racemes terminal, flowers purple. The genus is not completely known ; but it appears to be intermediate between Siliquosæ and Siliculosæ ; related to Draba on one hand, and Arabis on the other. It is a native of the Carinthian alps, where it was found by Dr. Hoppe, who named it after Count Bray, a German nobleman.

1388. *Parrya.* Named by Mr. R. Brown, after Captain Edward Parry, the commander of the British expeditions to discover the north-west passage round America. It was found upon Melville island, and once was raised from seeds brought home by some of the officers, but it never flowered, and is now lost.

1389. *Turritis.* From *turris*, a tower ; the leaves and seeds giving the stem a pyramidal form. This genus is principally distinguished from Arabis by its seeds being in two rows, and by its habit.

1390. *Arabis.* Native of *Arabia*, according to De Theis ; but this is a forced explanation, and scarcely the true root of the word. Distinguished from all the neighbouring genera by its linear compressed siliques, and flat valves.

History, Use, Propagation, Culture,

1391. *Macropodium.* So named because the pod is elevated above the receptacle upon a stalk; μακρος, long, and πους, a foot or stalk. A genus differing from Arabis chiefly in its stalked pod, and its calyx being a little thickened at the base. A little, smooth, erect, simple herb, with ovate, lanceolate, acuminate leaves, and white flowers.

1392. *Cardamine.* From καρδια, the heart, and δαμαω, to strengthen, in allusion to its supposed stomachic qualities. The leaves of C. pratensis were formerly used in salads. C. impatiens is so named from the sudden bursting of the seed pods, being ripe and pressed between the fingers. C. pratensis frequently has double flowers. C. hirsuta and, it is said, other species, produce young plants from the leaves. All that is necessary is to lay the leaf on a moist grassy surface, or on moss kept moist. The plant propagates itself extensively in this way in moist soils.

1393. *Pteroneuron.* From πτερον, a wing, and νευρον, a nerve, in allusion to the winged nerves of the pods, by which it is distinguished from Dentaria and Cardamine.

9005 Lower lvs. stalked lyrate: terminal lobe ovate; upper lanceolate cut, Stem branched weak softly villous
9006 Leaves all stalked ovate acumin. coarsely toothed velvety with very fine down, Pedic. and pods spreading
9007 Lvs. stem-clasping acum. somewhat toothed pubescent, Pedicels length of calyx, Pods 1-sided decurved
9008 Leaves stem-clasping toothed oblong dilated and cordate at base, Stem furrowed hispid, Pods pendulous
9009 Cauline leaves linear sessile smooth: lower somewhat toothed; radical obovate, Pods erect
9010 Cauline leaves sessile oblong lanceolate acuminate somewhat toothed, Pods pendulous falcate [stalk
9011 Lvs. roughish nearly ent.: rad. obov.; caul. ov. or obl. Rac. nodding, Pods erect 3 times as long as their
9012 Lvs. smooth nearly entire: rad. obovate; cauline ovate, Raceme erect, Pods 4 times as long as their stalk
9013 Leaves smooth nearly entire: rad. oblong obovate; cauline few oblong, Raceme nodding, Pods. erect
9014 Lvs. hoary with stellated down obl. sinuate toothed: rad. stalked; caul. sess. Pods 8 times as long as their
9015 Leaves stem-clasping shining [stalk

9016 Leaves ovate lanceolate acuminate subserrate, Raceme terminal long

9017 Lvs. smooth stalked cordate roundish subsinuate toothed, Stem erect, Pods erect twice as long as stalk
9018 Leaves smooth thickish: radical stalked ovate entire; cauline few entire or 3-lobed, Pods erect
9019 Leaves smooth membranous stalked: radical undivided; lower cauline 3-fid, upper 5-lobed, Pods erect
9020 Leaves smooth 3-fid, Segments stalked ovate acuminate toothed, Pods spreading
9021 Lvs. smoothish 3-fid, Segm. sess. rhomb. roundish tooth. Scape naked, Lower branches root-like creeping
9022 Leaves above downy trifid, Segments somewhat stalked ovate lanceolate crenate, Stem ascending
9023 Radical leaves stalked ovate subcordate: cauline pinnatifid with oblong entire lobes, Root granular
9024 Leaves pinnatifid, Segments of radical roundish; of cauline toothed angular, Stem rooting at base
9025 Lvs. pinnatifid, Segm. ovate nearly entire: term. round. 3-lobed, Runners creeping, Stem ascend. pubesc.
9026 Lvs. pinnatifid, Segm. of rad. roundish: of cauline linear or lanc. entire, Style very short, Stigma capitate

9027 Leaves pinnatifid or lyrate, Lobes oval angular toothed blunt, Stem erect, Petals oblong linear
9028 Leaves pinnatifid, Segm. of radical roundish mucronate stalked, of the upper oblong subsess. Petals obl.
9029 Leaves pinnatifid, Lobes sessile obl. linear entire the lowest distant from the stem, Petals oblong linear
9030 Leaves pinnatifid, Segm. oval oblong somewhat toothed, lowest close to the stem acute stipule-like
9031 Leaves pinnatifid smooth, Segm. 3-7 roundish toothed angular, Pods erect a little longer than stalk
9033 Leaves pinnatifid nearly smooth, Segm. stalked ovate toothed lower pinnatifid, Segm. 3-4

9033 Segm. of leaves somewhat stalked roundish tooth-lobed nearly equal

9034 Leaves 3 whorled stalked trifid, Segm. oval lanceolate acuminate serrated, Stamens length of petals
9035 Leaves 1-2 alternately shortly stalked 3-fid, Segm. ovate lanceolate coarsely and unequally serrate lobed
9036 Leaves many alternate stalked trifid, Segm. broad oval cut toothed, Axillæ without glands
9037 Leaves many alternate stalked trifid, Segm. ovate-lanceolate remotely toothed, Axillæ with glands
9038 Caul. lvs. many alternate stalked palmate 5-lobed, Segm. oblong lanceolate acuminate coarsely serrated
9039 Cauline leaves alternate stalked pinnatifid, Segm. oblong acuminate serrate toothed
9040 Cauline leaves alternate pinnatifid: upper undivided mostly bearing bulbs in the axillæ

9041 Pods lanceolate narrowed at each end
9042 Pods elliptical blunt at each end

9043 Leaves sub-bipinnatifid, Lobes oblong sinuate angular

9044 Stem shrubby erect, Leaves linear with close hairs
9045 Stem half-shrubby at base erect, Leaves lanceolate downy
9046 Stems half-shrubby ascending, Leaves oblong obovate stalked and pods hoary with down
9047 Stems herbaceous erect, Leaves oblong repand, Pods velvety with short down, Stigma capitate

and Miscellaneous Particulars.

1394. *Dentaria.* From *dens*, a tooth; its roots are furnished with projecting angles, which resemble the molar teeth of quadrupeds. Plants with broad palmate or pinnate leaves, and shewy white, yellowish, or purple flowers. The dried root of D. diphylla is used instead of mustard by the Americans, under the name of *pepper root.*

1395. *Lunaria.* Derived from *luna*, the moon, in allusion to the broad round silvery silicles. Large hairy plants, with alternate or opposite cordate leaves, and large lilac flowers.

1396. *Ricotia.* A word, the meaning of which is no where explained. It was probably formed after some obscure botanist. Small weak branched annual plants, with variously lobed foliage, and pale lilac flowers.

1397. *Farsetia.* In memory of Philip Farseti, a noble Venetian, celebrated for his botanical erudition. A small genus, with hoary entire leaves, and yellow or dirty-white flowers.

History, Use, Propagation, Culture,

1398. *Berteroa.* Named after Charles Joseph Bertero, a pupil of Balbis, and a friend of M. Decandolle, who speaks in high terms of his merits. A genus distinguished from its allies by its bifid petals and peculiar habit.

1399. *Aubrietia.* Named by Adanson, after Aubriet, the famous French botanical draughtsman. A genus very distinct in habit, and sufficiently different from Berteroa in its entire petals, and from Alyssum in its bisaccate calyx and oblong fruit.

1400. *Vesicaria.* From *vesica*, a blister or bladder. The silicles of this genus are inflated like small bladders. This is a genus which combines species with bisaccate and an equal calyx, with entire and toothed stamens, with edged or not edged seeds, and with a deciduous or persistent calyx. It will, therefore, require division hereafter.

1401. *Alyssum.* From α, privative, and λυσσα, rage; the Alyssum passed among the ancients for a plant which possessed the properties of allaying anger. The αλυσσον of Dioscorides is referred by Sprengel to A. alpestre. The species are shewy plants, of easy culture. A. saxatile is very ornamental early in the season.

9048 Silicles pubescent somewhat ventricose

9049 Silicles compressed flat elliptical smooth

9050 Silicles flat elliptical downy

9051 Pedicels longer than calyx

9052 Calyx bisaccate, Leaves oblong entire smooth ; lower ciliate subspatulate
9053 Calyx equal somewhat spreading and leaves velvety oblong entire or sinuate toothed, Stem herbaceous
9054 Calyx deciduous, Leaves oblong entire or repand wavy hoary with down

9055 Stems ½ shrubby at base subcorymbose, Leaves lanc. entire downy, Pods obov. orb. 2-seeded, Seeds edged
9056 Stems ½ shrubby at base panic. Leaves lanc. nearly entire velvety, Pods roundish 2-4-seeded, Seeds edged
9057 Stems ½ shrubby at base hoary with stellate down, Lvs. obl. spatul. silvery beneath, Pods ovate roundish
9058 Stems ½ shrubby at base hoary with stellate down, Leaves obl. obov. silvery beneath, Pods elliptical
9059 Stems ½ shrubby at base hoary with stellate down, Leaves obl. nearly acute whitish beneath, Pods ovate
9060 Stems ½ shrubby at base twisted diffuse hoary, Leaves hoary sublanceolate, Racemes corymbose
9061 Stems ½ shrubby at base diffuse hoary, Leaves obovate hoary, Racemes simple, Pods ovate oblong
9062 Stems diffuse pubescent, Leaves hoary : lower obovate ; upper oblong, Racemes simple
9063 Stem erect, Flowering branches panic. Lvs. lanceol. downy, Pods roundish elliptic. little longer than style
9064 Stem erect, Leaves lanceolate, Pods hirsute in long racemes twice as long as style
9065 Stems diffuse, Leaves lanceolate or somewhat linear hairy, Pods roundish rough 6 times as long as style
9066 Stems diffuse, Leaves linear lanceolate hoary, Cal. persistent, Pods four times as long as style
9067 Stems diffuse, Leaves linear lanceolate hoary, Pods roundish emarginate smooth
9068 Stem erect, Leaves velvety oblong sinuated : upper linear, Cal. spreading, Petals bifid
9069 Stems half shrubby at base procumbent, Leaves lin. lanceol. acute somewhat hoary, Pods oval smooth
9070 Stems half shrubby at base somewhat erect, Rad. lvs. obl.-lanc. acute silvery : caul. few lin. Pods woolly
9071 Stems ½ shrubby ascend. Lvs. obl. obt. narrowed at base scaly, Pods roundish smooth twice as long as style
9072 Stem shrubby, Branches and old peduncles spiny, Leaves obl. linear silvery, Pods round smooth

9073 Stems diffuse or ascending

9074 Cauline leaves sagittate stem-clasping, Pods flat smooth

9075 Leaves sessile 3-5-fid at end cuneate at base

9076 Scapes naked smooth, Leaves rigid linear lanceolate keeled ciliated, Stamens as long as petals
9077 Scapes naked smooth, Leaves long linear keeled ciliated, Stamens scarcely as long as calyx
9078 Scapes naked smooth, Leaves linear keeled rigid ciliated, Style as broad as hairy pod but twice as short
9079 Scapes naked downy, Leaves lanceolate flat hairy, Hairs branched, Pods oblong, Style very short
9080 Scapess downy with 2 toothletted leaves, Rad. leaves obl. nearly entire downy, Pods smooth
9081 Scapes naked or 1-leaved downy, Leaves lanc. hairy nearly entire, Pods lanceol. pubescent
9082 Scapes 1-leaved pubescent, Leaves ovate obl. with a short starry down, Pedicels downy, Pods oblong
9083 Stem leafy branched velvety with starry down, Leaves ovate toothed, Pod obl. smooth somewhat twisted
9084 Stem leafy branched velvety with starry down, Leaves obl. somewhat toothed, Pods obl. pubescent
9085 Stem branched leafy downy, Leaves ovate toothed downy, Pods ellipt. obl. many-seeded (32-36) velvety
9086 Stem branched leafy downy, Lvs. ovate toothed subcord. stem-clasping somewhat hairy, Pods smooth few-seeded (12-16)

9087 Pods elliptical shorter than stalk, Scapes 5-15-flowered

and Miscellaneous Particulars.

1402. *Clypeola.* From *clypeus*, a buckler, in allusion to the form of its silicle. A little annual plant, hoary, with stellate pubescence.

1403. *Peltaria.* A name with the same meaning and application as the last; πελτη signifies in Greek a small buckler.

1404. *Petrocallis.* From πετρον, a rock, and καλος, beautiful, in allusion to the rocky places where it grows, and which it enlivens with its elegant tufts of rose-colored flowers.

1405. *Draba.* From δραβη, acrid, biting, according to Linnæus. Little annual or perennial plants, found, for the most part, in the cold mountainous countries of Europe ; a few are also found in America. Some of the species have siliques, others silicles.

1406. *Erophila.* A genus divided from Draba, on account of its bifid petals ; and deriving its name from ηρ, the spring, and φιλεω, to love, in allusion to the time of the year when it appears.

History, Use, Propagation, Culture,

1407. *Cochlearia.* From *cochlear*, a spoon. The leaves are hollowed and concave like the bowl of a spoon. The annual species were formerly used as spring salads and antiscorbutics, but are now generally neglected.

C. armoracia, the horse radish, is cultivated as a condiment to roast beef. It is called upon the continent *Cran, Cran de Bretagne, Raifort, Reeredyck*, &c. &c. Two excellent modes of cultivating it have lately been described in the Horticultural Transactions, by Knight, a nurseryman, and Judd, a gardener. Both Knight plants the sets on the surface, and calculates on the root that strikes down to the dung for produce. Judd, on the other hand, makes holes quite to the bottom of his trenched soil, and in each drops a set, filling up the hole with wood ashes, rotten tan, or sand, calculating for produce on the shoot made from the set at the bottom of the hole, up through the sand or ashes to the surface. Judd's mode is the most ingenious, and appears the best, but either will do extremely well. A moist soil increases the bitter and alkaline flavor of this and all the Cruciferæ.

Common scurvy-grass has powerful medical properties, as antiscorbutic and sialagogue, and stimulating the digestive organs. For ample details respecting its qualities, consult *Wier Cochl. Descr.* lib. 1., Basileæ, 1567. *Mœllenoroch Cochl. Cur.*, Lipsiæ, 1674. *Murr. App. Med.* 2. p. 420, &c.

9088 Pods lentiform smooth, Rad. leaves obl. toothed hairy; cauline linear oblong
9089 Pods ellipsoid, Rad. leaves obl. crenate; cauline long lanceolate toothed or cut, Root large fleshy
9090 Pods ellipsoid, Rad. lvs. obl. crenate; cauline lanc. toothed, Teeth cartilaginous, Root fleshy, Sepals erect
9091 Pods roundish, Cauline leaves cordate sagittate stem-clasping acuminate entire
9092 Pods ovate roundish with netted veins twice as short as stalk, Rad. leaves stalked ovate entire; caul. obl.
9093 Pods ovate globose twice as short as stalk, Rad. leaves stalked cordate; cauline ovate toothed angular
9094 Pods ovate the length of stalk, Rad. leaves stalked reniform entire; cauline scarcely any
9095 Silicles ellipsoid the length of pedicel, Leaves all stalked subdeltoid
9096 Silicles roundish emarginate, Pedicels and petioles radical long, Leaves ovate rounded entire

9097 Radical leaves on long stalks cordate repand-toothed; cauline ovate cordate on short stalks
9098 Rad. lvs. somewhat stalked obovate-obl.; cauline oblong at the base hastate stem-clasp. with acute auricles
9099 Leaves oblong toothed, Stems erect, Silicles obovate orbicular shorter than pedicel
9100 Lvs. obl. tooth. blunt: lower stalked; upper sagit. stem-clasp. with acute auricles, Silicles subov. ventricose
9101 Lvs. somew. tooth.: rad. stalk.; caul. cord. stem-clasp. Stem branch. Pet. length of cal. Silicles obcordate
9102 Lvs.somew. fleshy ent.: rad. obov. stalk.; caul. obl. sagitt. stem-clasp. Pet. larg. than cal. Silic. obc. 4-seeded
9103 Lvs. nearly entire: rad. ovate stalked; caul. obl. stem-clasp. Pet. as long as cal. Silic. obcord. 8-12-seeded

9104 Radical leaves pinnatifid, Silicles obcordate

[twice as short as silicle
9105 Lvs. somew. fleshy entire: lower stalk. obov.; caul. ovate obl. somewhat stem-clasp. Stam. petals and style
9106 Lvs. somew. fleshy: lower stalk obov. obl. entire; caul obl. Stamens petals and style about length of silicle
9107 Lvs. pinnated smooth, Pet. twice as long as decid. cal. Silicles acute at each end, Style very short exserted
9108 Lvs. pinnated, smooth, Pet. scarcely longer than calyx, Silicles blunt at each end 4-seeded, Stigmas sessile

9109 Petals unequal: outer largest
9110 Petals equal

9111 Shrubby, Lvs. cuneate or spatul. blunt ent. smooth, Flowers corymbose, Silicles truncate subemarg. at end
9112 Shrubby, Leaves cuneiform obtuse somewhat toothed at end a little ciliated, Flowers corymbose
9113 Shrubby, Leaves linear entire somewhat fleshy rather acute smooth or ciliated, Flowers corymbose
9114 Shrubby, Leaves ciliated blunt linear spatulate; lower somewhat toothed at end, Flowers corymbose
9115 Shrubby, Lvs. obl. blunt narrowed at base smooth, Fls. in long racemes, Silic. emarg. with a narrow recess
9116 Herbaceous, Lvs. lanc. acute somew. toothed, Fls. corym. becoming racem. Silic. obcord. narrowly emarg.
9117 Herbaceous, Lvs. lanc. blunt smooth entire or the rad. somew. toothed, Fls. finally racem. Silic. ovate trun.
9118 Herbaceous smooth, Leaves pinnatifid, Racemes corymbose but little elongated after flowering [style
9119 Herb. smooth, Lv. lin. tooth. ciliat. at base dilat. at end, Silic. round. Lobes of end acute spread. short. than
9120 Herbaceous smooth, Leaves lanc. acuminate: lower serrate; upper entire, Silicles umb. acutely 2-lobed
9121 Herbaceous smooth, Leaves linear entire: radical somewhat toothed, Silicles corymbose 2-toothed
9122 Herb. smoothish, Lvs. lin. entire ciliated at base, Silic. corymb. emargin. with blunt lobes as long as styles
9123 Herb. smoothish, Leaves ciliat. somew. fleshy: lower spatul. 2-tooth. at end; upp. lin. Silic. corymb. emarg.
9124 Herb. smoothish, Lvs. stalked spat. blunt toothed and ent. ciliat. Corymb somew. umbel. Cal. hairy at back
9125 Herbaceous smooth, Lvs. round. spatul. ent. rather fleshy, Silic. corymb. emarg. with a broad blunt recess
9126 Half-shrubby at base pub. Lvs. rather fleshy cren.: lower ob. narr. at base; u[illegible] obl. lin. Sil. somew. corymb.

[emarginate
9127 Cal. bluntly 2-spurred, Silicles smooth rough with elevated dots in centre, Lobes of end meeting over style
9128 Cal. bluntly 2-spurred, Silicles smooth even, Lobes at the end somewhat meeting over the style
9129 Cal. acutely 2-spur. Silic. smooth with elevat. rough points on disk, not overhang. style at end, Stem hispid
9130 Silicles hispid on each disk, Radical leaves lyrate
9131 Silicles smooth even, Radical leaves lyrate

and Miscellaneous Particulars.

1408. *Thlaspi.* From θλαω, to compress. The Thlaspi, says Pliny, bears seeds like the lentil, and compressed, whence its name. T. arvense, when rubbed, has the smell of garlic.

1409. *Capsella.* A diminutive of *capsula.* This, which is the common shepherd's-purse, has been separated from Thlaspi on account of its valves not being winged at back.

1410. *Hutchinsia.* Named after Miss Hutchins, to whom Sir James Smith was indebted for many communications of submarine algæ during the progress of his English Botany.

1411. *Teesdalia.* Named after Mr. Robert Teesdale, author of a Catalogue of the Plants growing about Castle Howard, in the North Riding of Yorkshire, published in the Transactions of the Linnean Society. Small annual smooth herbs, with revolute leaves, and simple scapes of small white flowers.

1412. *Iberis.* From the country called *Iberia*, now Spain. Most of the species grow in such countries. They are generally pretty plants, and some of them are commonly cultivated in gardens as hardy annuals, under the name of Candy-tuft; a name which was originally applied to the I. umbellata only, which was first discovered in Candia, and called Thlaspi Candiæ by Lobel and Dodonæus.

1413. *Biscutella.* From *bis scutella*, a double shield, in allusion to the form of its seed-vessel when bursting. Small annual or perennial hispid plants, with small bright yellow flowers. The species are nearly related to each other, and difficult to distinguish.

History, Use, Propagation, Culture,

1414. *Euclidium.* From ευ, well, and κλειδοω, to shut up, because of the firmly closed seed vessel.

1415. *Ochthodium.* So called from οχθωδης, warted, in allusion to the surface of the pods.

1416. *Anastatica.* Derived from αναστασις, resurrection. This plant has been so called because it has the curious property of recovering its original form, however dry it may be, upon immersion in water. The common people believe that if you put this in water at the time when a woman first experiences the pains of childbirth, it will expand at the precise moment when the infant is brought into the world. Commonly called Rose of Jericho. It grows in the arid wastes of Arabia and Palestine, where it is called *kaf maryam,* that is to say, Mary's hand.

1417. *Cakile.* An Arabic word employed by Serapio. Smooth fleshy annual plants, with pinnatifid leaves, and white or purple flowers. They all grow upon the sandy coasts of the northern hemisphere. C. maritima is said by Anguillara to be a powerful cathartic.

9132 Silicles even ciliated at edge, Radical leaves lyrate
9133 Silicles even ciliated at edge, Stem erect elongated leafy, Leaves sessile oblong remotely toothed [at base
9134 Sil. rough on edge and disk with a very fine down, Rad. lvs. obov. cun. acute tooth. Stem somew. nak. hisp.
9135 Silicles rough on the edge and disk with a very fine down, Leaves lanc. serrate, Stem leafy branched hairy
9136 Silicles smooth even, Rad. leaves rough with hair oblong narrowed into stalk : cauline linear few entire

9137 Silicles smooth even, Leaves rough with hairs, generally radical pinnatifid with 2-3 rem. lobes on each side
9138 Sil. smth. even, Lvs. rough with hairs : rad. sin.-tooth. nar. at base ; caul. very few cord. at base ½ stem-clasp.
9139 Silicles smooth rough with elevated dots on the disk, Leaves hairy generally radical oblong
9140 Silicles smooth rough with elevated dots on disk, Lvs. mostly radical erect linear lanc. hoary nearly entire

9141 Silicles scabrous with a persistent subulate style, Cauline leaves stalked lanceolate

9142 The only species

9143 The only species

9144 Upper joint of the silicle ensiform

9145 Silicles smooth : upper joint ovate longer than style, Leaves pinnatifid, Lobes toothed cut acute

9146 Silicles downy : upper joint round rugose shorter than style, Leaves blunt toothed ; radical sublyrate

9147 Silicles furrowed smooth, Leaves oblong toothed sinuated

9148 Silique and leaves smooth : upper lanceolate toothed ; lower pinnatifid

9149 Siliques and leaves nearly smooth, Leaves all sinuate pinnatifid

9150 Stem branched diff. Lvs. lanc. somew. toothed, Down 2-4-parted, Pedi. shorter than persist. cal. Siliq. rough
9151 Stem erect simple, Lvs. obl. cut tooth. Down 3-parted, Pedi. shorter than decid. cal. Siliq. smth. about 4-cor.
9152 Stem branched somew. hairy at base, Lvs. ov. acute toothed angul. and siliq. smooth, Pedi. shorter than cal.
9153 Stem erect branch. Lvs. obov. ent. Down 2-parted app. Pedi. length of cal. Siliq. round. pub. Style very short
9154 Stem erect branched, Lvs. ellipt. blunt ent. narr. at base, Down appr. 2-4-parted, Pedicels shorter than cal.
9155 Stem erect branched, Lvs. lanc. acute : lower toothed sess. Down stel. Pedi. very short, Pods torulose subul.
9156 Stem erect branched, Lvs. obl. blunt nearly ent. Down tom. stel. Pedicels finally as long as cal. Pods pubesc.
9157 Stem erect branched, Lower lvs. lyrate stalked blunt, Down appr. 2-part. Pedicels length of cal. Pods pubesc.
9158 Stem compound erect, Leaves lanceolate linear nearly entire hoary, Pedicels length of cal. Pods hoary

9159 Pedicels very long spreading stiff as broad as silique which is thickened at each edge, Petals obl. oblique
9160 Pedicels shorter than cal. Petals obovate oblong, Leaves obovate cut-toothed, Stem hispid
9161 Pedic. longer than cal. Petals obov. somew. pointed, Lvs. downy : lower lyrate runcinate ; upper lanc. acum.

9162 Pedicels length of cal. Petals obov. Siliq. erect torose smooth not thickened at edge, Lvs. ovate lanc. toothed

9163 Pedicels glandular hairy length of cal. Petals obovate, Leaves oblong blunt and stem simple ciliate hispid
9164 Pedic. scarcely so long as cal. Petals obovate, Leaves somewhat radical somewhat fleshy lanc. Scape simple

and Miscellaneous Particulars.

1418. *Rapistrum ;* that is to say, resembling *Rapa.* A genus very near Cakile, from which it differs in having yellow flowers, and leaves not fleshy, and more or less hairy.

1419. *Chorispora.* From χωρις, separately, and σπορα, seed ; each seed being enclosed separately in the pod. This differs from Raphanus in having flat decumbent cotyledons, not folded incumbent ones. Little annual plants.

1420. *Malcomia.* Named after Mr. William Malcolm, an eminent nurseryman in the neighbourhood of London, and a person of some botanical acquirements. M. maritima is a common annual, which, sown at different times, or left to sow itself, will be in flower nearly all the year.

1421. *Hesperis.* From ἑσπερος, the evening. The flower is more fragrant towards evening than at other periods of the day. H. matronalis, in its double varieties, is rather difficult to keep, and requires to be yearly renewed by cuttings. It prefers a strong loamy soil ; and it has been remarked, that it neither thrives in the neighbourhood of London or Paris.

History, Use, Propagation, Culture,

1422. *Sisymbrium.* Σισυμβριον was the name given by the Greeks to some aquatic plant not now recognized. It appears to have had an agreeable smell. Ovid advises that Venus should be propitiated with garlands of myrtle, of roses, and of Sisymbrium. S. officinale is a celebrated medicinal plant, and esteemed diuretic, detersive, and expectorant, and prescribed in asthma and hoarseness, whence the French call it *Herbe aux chantres.*

1423. *Alliaria.* From *allium*, garlic, in allusion to the smell of the leaves of this plant, for the sake of which it was formerly used in salads.

1424. *Erysimum.* From ερυω, to cure, on account of the salutary effects of this plant in medicine. It is even now reckoned a powerful cure for the sore throat. The plant of the ancients appears to have been our garden cress; for Pliny says the Gauls called his Erysimum *velar*, and the garden cress is to this day called *vilhar* in

9165 Leaves runcinate hairy, Stem hairy, Siliques subulate appressed to the rachis
9166 Leaves lanceolate stalked toothed pubescent
9167 Leaves smooth glaucous: lower stalked runcinate pinnatifid; upper linear lanceolate entire
9168 Leaves lanc. toothed sessile smooth, Stem branched divaricating, Siliques erect roundish smooth [base
9169 Leaves pinnated, Lobes oval oblong blunt sinuate-toothed with rounded recesses, Stem hispid backward at
9170 Stem and lvs. smth.: rad. runcin.; caul. pinnatifid, Lobes and recesses acute, Cal. much spread. Pods rough
9171 Stem pods and lvs. smooth: rad. runcin.; cauline cut or pinnatifid, Lobes and recesses acute, Cal. spreading

9172 Stem and leaves smooth runcinate pinnate, Lobes toothed terminal elongated, Cal. and pods spreading erect
9173 Stem villous somew. hoary, Leaves runcinate pubes. Lobes toothed or ent. acute, Pods nearly erect, Cal. lax

9174 Lower leaves runcin. hispid with toothed lobes: upper pinnated smooth with lin. ent. lobes, Pods spreading
9175 Lvs. smth. pinnat. with obl. blunt somew. tooth. lobes, Pedic. very sh. Pods muric. rough point. with sh. style
9176 Leaves bipinnate with oblong linear cut lobes, Pedicels 4 times as long as calyx, Petals smaller than calyx
9177 Leaves about 3-pinnate hoary with very small blunt lobes, Stem ½ shrubby, Petals larger than calyx
9178 Lvs. pinnated, Segm. lanc. cut serrated: outer confluent, Petals larger than calyx, Pods shorter than stalk
9179 Pedic. axillary very short solitary, Pods erect downy, Leaves sinuate pinnatifid, Stem downy backwards
9180 Pedic. about 3 axill. very short, Pods erect smooth, Lvs. sinuate runcin. Lobes acute toothed lowest largest
9181 Pedic. very short axill. or naked, Pods and stems erect hispid, Leaves smoothish obl. acutely runcin.-pectin.
9182 Leaves lyrate pinnatifid smooth, Stem erect leafy, Pedicels thick shorter than calyx
9183 Rad. leaves lyrate: cauline pinnat. Lobes linear ent. term. largest, Pedic. slender almost shorter than calyx
9184 Leaves linear entire, Branches and pedicels glandular and hairy, Pods glandular

9185 Leaves cordate, Pods prismatical much longer than pedicel

9186 Leaves ovate roundish, Pods lanceolate the length of their stalk

9187 Pods length of style: when young covered by the persistent calyx, Fl. sessile, Leaves linear entire
9188 Pods much longer than style when young having a persistent calyx, Fl. subsessile, Leaves linear entire
9189 Pods thrice as long as style 2-edged naked, Fl. on short stalks, Leaves oblong lanceolate sinuate toothed
9190 Leaves lanc. toothed pubescent with a 3-parted down, Stem branched, Pods lax, Stigma 2-lobed [of pod
9191 Lvs. obl. lanc. somew.tooth.pub with 3-part. down, Stem straight round, Length of style great. than breadth
9192 Lower leaves runcinate toothed: upper lanc. undivided, Fl. branches and pods comp. 4-cor. erect spreading

9193 Lvs. lanc. somew. toothlet. roughish green, Pods erect spread. twice as long as stalk, Stigma small subsessile
9194 Leaves linear lanc. repand-toothed, subpubes. Pods spreading torulose scarcely thicker than short pedicel
9195 Lvs. lin. entire and stem cinereous with appressed 2-parted hair, Pods somew. erect, Stigma stalked emarg.
9196 Lvs.lin.ent.or somew.tooth.somew. hoary with 2-part. hair, Claws long. than cal. Pods erect, Stig. near sess.
9197 Lower lvs. lanc. toothed: upper somewhat linear entire, Petals roundish obovate, Claws longer than calyx
9198 Leaves lanceolate toothed narrowed at base, Petals obovate oblong, Pods spreading, Style scarcely any
9199 Leaves lin. obl.: lower toothed runcin. and stem pubesc. rough, Pods spreading, Style very short and thick
9200 Leaves membranous smoothed: cauline cordate sagittate stem-clasping oblong; radical stalked ovate

9201 Rad. lvs. obov.: cauline cordate stem-clasping, all blunt smooth glauc. Sides of square stalk without nerves

9202 Pods cuneate pyriform with 4 ribs and a longish style, Leaves lanceolate nearly entire
9203 Pods roundish pyriform with 4 ribs and a longish style, Leaves repand toothed
9204 Pods globose, Leaves oblong serrate toothed bluntly stem-clasping at base, Stem smooth

9205 The only species

9206 Leaves pinnatifid, Lobes oblong toothed or cut, Pods compressed twin netted
9207 Lvs. pinnatifid, Lobes ent. toothed or pinnatifid, Pods somew. acute compressed with crested rugose valves

and Miscellaneous Particulars.

the Basque tongue, and in other dialects of France *beler* or *veler*. From the seeds of E. perfoliatum, a plant not known in this country, oil for lamps is expressed in Japan.

1425. *Camelina;* that is to say, *chamæ-linum*, dwarf flax. C. sativa is cultivated in many parts of Europe for the seeds, from which oil is obtained. For the method of its culture see Parmentier, in Roz. *Cours d'Agric.*, *v.* xi. *p.* 291. Bosc. *Dict. d'Agr.* 3. *p.* 45. Galliz. *Bot. Agr.* 3. *p.* 170.

1426. *Neslia.* A name first employed by M. Desvaux, but not explained by him. A genus allied to Camelina, but well distinguished by its one-seeded indehiscent silicles.

1427. *Coronopus.* From κορωνη, a crow, and πους, a foot. The leaves are deeply cut, and resemble the feet of a bird. Coronopus Ruellii was formerly gathered and used as a salad, but has long since been deservedly neglected. C. niloticus is said, by Delile, to be used in Egypt for the same purpose.

History, Use, Propagation, Culture,

1428. *Lepidium.* From λεπις, a scale. The form of the silicles is that of little scales. L. piscidium is used by the natives of the Society Islands for the purpose of catching fish by inebriating them. It was used by the English voyagers as a salad, but it was very pungent. L. oleraceum is a powerful antiscorbutic, and is found of great service to the crews of ships visiting New Zealand; it resembles lettuce in taste, and acts as a moderate aperient. L. sativum, the common garden cress, is a salad-plant known to every one, and which even the cook can cultivate on moistened cloth or wool in a moist heat. Watering with water, impregnated with muriatic acid gas, or electrifying, will facilitate the germination and developement of the seeds.

1429. *Æthionema.* So named by Mr. R. Brown, apparently in allusion to some tawny or sunburnt tinge in the stamens. From αιθω, to scorch, and νημα, a stamen. *Smith.*

1430. *Isatis.* From ισαζω, to render equal. The plant was believed to destroy, by its simple application, all roughness and inequalities of the skin. It was formerly called *glastum*, from the Celtic *glas*, blue, whence *Glastonbury* derived its name. The ancient Britons colored themselves with the blue preparation obtained from this plant, whence they received their appellation, *Britho* being the Celtic word for to paint. The Picts were so named by the Romans for the same reason. On account of the brightness of its manufactured colors the Celts called it *gwed* (*guesde*, French, at this day), whence the Anglo-Saxons obtained their name of *waad* or *wad*, and the English the word *woad*. I. tinctoria is in occasional cultivation for its leaves, from which a dye, as a substitute for indigo, is obtained. The seeds are sown on well prepared land in good heart; fresh broken old pasture land is preferred; and the great object is to have large leaves; for which purpose, as Miller observes, the culture given by the best gardeners to spinage should be imitated, that of sowing on a very rich well pulverised soil, thinning the plants so as they may not touch each other, keeping them perfectly clear of weeds, and frequently stirring the soil between the plants. The culture applied to the turnip in Northumberland would succeed well with woad. The seeds are sown in July, and the plants, when they come up, weeded and thinned; next July, or earlier, the first crop of leaves may be gathered, and two or three others will be ob-

9208 Pods cordate somewhat turgid entire at the end exceeded by the style, Leaves stem-clasping lanc. toothed
9209 Pods elliptical twice as long as stalk, Style filiform, Leaves with acute stem-clasping lanceolate auricles
9210 Pods ellipt. smooth shorter than stalk, Style filif. Leaves with blunt stem-clasping obl. bluntly toothed auric.
9211 Pods ellipt. ent. somew. downy pointed with style, Cal. somew. persistent, Rad. lvs. pinnat. : caul. lin. ent.

9215 Pods oblong winged emarginate about 2-horned smooth, Radical leaves pinnatifid with cut lobes
9216 Pods orbic. emarg. shorter than stalk, Flowers with 2-4-stamens, Caul. lvs. lin. lanceol. cut-serrate smooth
9217 Pods ovate somewhat emarginate, Leaves subulate entire, Stem ½ shrubby
9218 Pods ovate emarg. spreading shorter than stalk, Leaves smooth : radical pinnatifid, Fls. diandrous apetal.
9219 Pods elliptical slightly emarginate, Leaves pinnatifid, Lobes linear, Joints of stem inflated
9220 Pods ellipt. slightly emarg. Lower lvs. stalked pinnatifid with multifid lobes : upper cord. amplexicaul entire
9221 Pods oval somewhat emarginate, Leaves pinnatifid with oval entire lobes : terminal large roundish
9222 Pods oval somew. emarg. approximat. Lower leaves pinnati. with spread. acute lobes, Stem much branched
9223 Pods orbicular emarginate, Flowers diandrous, Leaves all pinnately multifid minutely ciliated
9224 Pods oblong obovate emarginate, Stigma exserted, Leaves oval-oblong toothed outwardly or entire
9225 Pods ovate acutish, Leaves smooth ellipt.-oblong deeply serrated : upper entire somewhat serrated at end
9226 Pods ovate pointed with stigma, Lower lvs. stalked lyrate pinnatifid, Lobes cut toothed : term. very large
9227 Pods ovate pointed with the stigma, Leaves ovate lanceolate undivided subserrate, lowest on long stalks
9228 Pods ovate pointed with stigma, Leaves smooth somew. fleshy entire, Rad. stalked ovate : caul. sess. sagitt.
9229 Pods elliptical pointed with stigma, Stems ½ shrubby, Radical lvs. obov. obl. toothed : cauline linear entire
9230 Pods ovate pointed with stigma, Rad. leaves cut or pinnatifid : cauline linear entire, Stem much branched

9231 Silicles 2-celled many-seeded obcordate, Valves winged at back and entire, Racemes in fruit lax
9232 Silicles 2-celled 2-seeded round emarg. at base and end, Racemes very close, Valves winged at back and ent.
9233 Silicles 1-celled 1-seeded not opening emarginate at end, Leaves oval or obovate

9234 Silicles round cordate at base with a wide margin pointed with the style
9235 Silicles obov. with a broad edge cuneate at base very blunt and emarginate at end, Stem and leaves smooth
9236 Silicles oval-oblong blunt at each end with a leafy winged margin 3 times as long as broad
9237 Silicles elliptical blunt at each end with a coriaceous winged edge three times as long as broad
9238 Silicles obl. cuneate very blunt truncate emarginate narrowed at base, three times as long as broad
9239 Silicles cuneate accuminate at base somewhat spatulate at end very blunt three times as long as broad
9240 Silicles oblong narrowed at base bluntish at end four times as long as broad [at end
9241 Silicles elongate-cuneate downy four times as long as broad and twice as long as the stalk which is obconical

9242 Silicles lin. blunt vill. with reversed down eight times as long as broad and three times as long as their stalk

9243 The only species

9244 Lvs. covered with glaucous pollen somew. fleshy repand or lobed even in their youngest state quite smooth

and Miscellaneous Particulars.

tained during the season. The end of the second year the plants may be ploughed down, as the third year they will run to seed, and yield but small leaves. The leaves are pressed, and the juice treated as in making indigo (see *Indigofera*); but such is the cheapness of the latter article, that no British farmer can afford to raise any sort of substitute.

1431. *Myagrum.* An ancient plant, so named from its properties of catching flies, which the modern plant does not possess; μυια, a fly, αγρα, capture.

1432. *Brassica.* The etymology of this word has been explained with great learning and ingenuity by Vossius, Ray, Dalechamp, and others. It comes, however, from the Celtic *bresic*, which signifies a cabbage. This genus affords the well known pot herbs and roots, and also the oil plant rape, extensively cultivated in agriculture. There is scarcely an instance in the vegetable kingdom of a plant that produces varieties so different in appearance and qualities as the B. oleracea; comparing the original plant as it is found on our shores, with wavy sea-green leaves, no appearance of a head, and flowering like wild mustard or charlock, with the red cabbage or cauliflower, the difference is astonishing. A new arrangement of the cultivated species of Brassica has been made by Professor Decandolle (*Hort. Trans.* vol. 1., and in his *Reg. Veg.*), whose varieties, or races of B. oleracea, are stated above.

The *colza* of the Dutch he makes a distinct species (B. campestris), and also the turnip (B. rapa); the rape (B. napus), and the summer rape of the Germans (B. præcox).

In Hungary, in the territory of Alba, the B. elongata is cultivated for its oil, for which purpose it is said to be better adapted than any other species.

The culture of all the Brassica tribe is so universally known that it would be a waste of space in a work of this sort to enlarge on it. They all prefer a loamy soil, well enriched with manure; and manures of the strongest kind, as nightsoil, offals from the shambles, blood, &c. are not found too powerful for common cabbage or cauliflower. The turnip prefers a lighter soil than the cabbage tribe, but it must be well manured, and if the

History, Use, Propagation, Culture,

manure be well fermented, so much the better for the garden turnip; in the fields, where it is buried in rows or drills, more littery dung will succeed.

The field culture of the turnip is become an important part of the agriculture of light soils; the best mode is by drills, as in Berwickshire and Northumberland, where are produced crops of treble the weight of those grown in the broad-cast manner in Norfolk. In the latter county a crop weighs from five to fifteen tons per acre; in Northumberland from twenty-five to thirty tons; and in Ayrshire as many as sixty tons have been raised on the statute acre. (*Encyc. of Agric.*)

The cabbage has been tried as a field plant; but, though it has been said by Sinclair (*Hortus Gram. Wob.*) to produce more nutritive matter than either turnips or field beet, professional farmers have not found it to answer.

Of all the Brassica tribe it may be observed, that they attain to much the greatest perfection in temperate climates, such as those of Britain and Holland. Without constant and liberal supplies of water, they are small in size, and rigid or stringy in texture. In France and in Italy, and warm climates, it is only the cauliflower and broccoli that attain a large size; and that, in Italy at least, is during the coldest months of the year, and aided by liberal waterings. But in Tarragona the cauliflower is said to reach the enormous weight of 40 lbs.

1433. *Sinapis.* In Greek σιναπι, said to be derived from *nap*, the Celtic designation of all plants resembling the turnip or cabbage. Our English word *mustard*, and the French *moutarde*, are modernizations of *mustum ardens*, hot must; the sweet must of new wine being one of the ingredients of the French mustard for the table. The seeds of all the species are hot, acrid, and will afford an oil by expression, and a powder or meal by drying and grinding, which might serve as the condiment mustard. S. nigra is more particularly adapted for the latter purpose, though it is often mixed with the seeds of S. alba and arvensis, and often with those of the

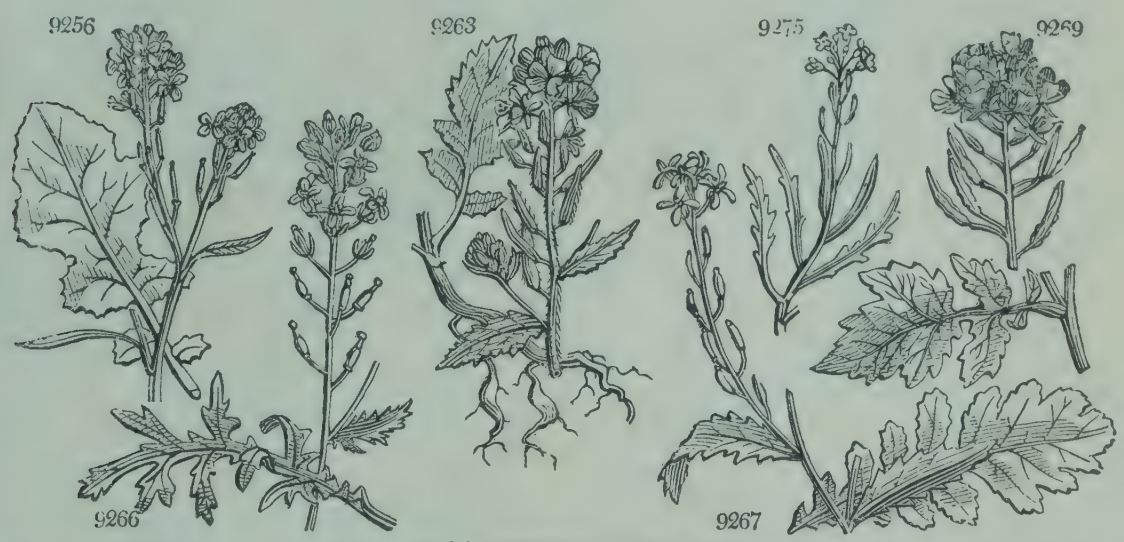
9270 Pods hispid spreading a little narrower than the ensiform beak, Lvs. lyrate rough, Stem hispid backwards
9271 Pods suberect torulose shorter than the ensiform beak, Lvs. pinnat. Lobes narr. cut-toothed or pinnatifid
9272 Beak compressed very rough longer than the hispid pod, Lvs. lyrate repand angular smooth
9273 Calyx bisaccate, Lvs. coriaceous: lower oblong lanc. narrowed at base somewhat toothed

9274 Pods about 4-cornered, Cauline leaves cordate amplexicaul entire

9275 Pods pendulous stalked, Cauline leaves oblong hispid coarsely cut-toothed
9276 Pods pendulous sessile, Leaves obovate coarsely toothed hispid
9277 Pods sessile nearly erect, Style ensiform, Leaves sessile runcinate lyrate toothed



and Miscellaneous Particulars.

Brassica and Raphanus genera. Both S. alba and nigra are grown as small salads to be eaten with cress; they are sown as thick as the seeds will lie, in pots or boxes, or in the area of forcing-houses, in the winter season, and forced, or in beds in the open air, and cut as soon as the seed leaf is fully expanded. For flower of mustard, or for the seed for oil or medical purposes, both white and black sorts are sown in the fields in rich well pulverized soil, in March or April, and kept free of weeds. The crop ripens in July and August, and is either threshed immediately or stacked like other grain. It is like other oleiferous seeds, exhausting for the soil, and such seeds as drop and are buried, will retain their vegetative qualities for an unknown length of time; so that where mustard has once been grown, it will come up occasionally for a century or more afterwards.

If the seeds, Dr. Cullen observes, be taken fresh from the plant and ground, the powder has little pungency, but is very bitter; by steeping in vinegar, however, the essential oil is cooled, and the powder becomes extremely pungent. In moistening mustard-powder for the table, it may be remarked, that it makes the best appearance when rich milk is used; but the mixture in this case does not keep good for more than two days. The seeds of both the black and white mustard are often used in an entire state medicinally. Half or a quarter of a wine glass of mustard seeds, swallowed fasting, about five in the morning, is the most powerful tonic and strengthener of the digestive organs which is known.

1434. *Moricandia.* Named by Decandolle, after his friend Stephen Moricand, author of the Flora Veneta, and an excellent Italian botanist. M. hesperidiflora is a favourite food of the camel, notwithstanding its intense acridity.

1435. *Diplotaxis.* From διπλος, double, and ταξις, arrangement, on account of the double rows of seeds in each cell.

History, Use, Propagation, Culture,

1436. *Eruca.* The meaning of this word is involved in obscurity. According to Isidore, of Seville, a learned Spaniard, who died in 636, and left a book of etymologies, *eruca* is an alteration of *urica*, derived from *uro*, to burn. From *eruca*, the Italians formed *rucheita*, the French *roquetta*, and the English *rocket*. E. sativa is very pungent in the foliage, and is used as a salad in the South of Europe for its aphrodisiacal powers:

"*Excitat ad venerem tardos Eruca maritos.*"

1437. *Vella.* Latinized from *valer*, the Gallic name of the cress. A pretty low shrub, with beautiful yellow flowers appearing in the early spring. It is hardy enough to live through the winter in a dry warm south border.

1438. *Carrichtera.* An unexplained name, first used by Adanson. A small annual plant, with pinnated leaves, and long erect racemes opposite to the leaves. Flowers small, pale yellow.

1439. *Succowia.* In honor of Professor Suckow, a learned botanist of Heidelberg. An annual, with the habit of the last, from which it differs in its subulate style and solitary seeds.

1440. *Zilla.* The Egyptian name of the plant, which is a large glabrous herb, with round white branches and oblong toothed leaves, which are boiled and eaten by the Arabs like those of cabbage.

1441. *Calepina.* A name used by Adanson, the meaning of which is unknown. This plant has been transferred by one author or another to almost every genus of Siliculosæ, but appears to be really akin to Crambe only, from which it differs in its sessile and purely unilocular silicle, in its stamens having no teeth, and in the outer petals being larger than the others.

1442. *Crambe.* One of the names applied by the Greeks to the cabbage, and especially to the marine cabbage. C. maritima grows on sandy shores in the west of England, and there the common people have from time immemorial been in the practice of watching when the shoots and leafstalks begin to push up the sand

9278 Pods sess. nearly erect, Style roundish 1-2-seed. Lvs. pinnatif. with cut lobes and lin. sinuate toothed segm.
9279 Pods somewhat stalked erect, Style filif. short without seeds, Upper lvs. entire lower pinnatifid compound

9280 Pods sess. erect, Style short somew. filif. Rad. lvs. toothed or lyrate smooth, Stems nearly naked ascending

9281 Pods sess. erect, Style short somew. filif. Rad. lvs. runcinate toothed hispid, Stems naked erect
9282 Pods sess. erect, Style short somew. filif. Rad. lvs. lyrate very blunt smooth, Stems naked decumbent
9283 Pods sess. erect narrowed at base, Style short conical, Rad. lvs. pinnatifid thickish with entire lobes

9284 Lvs. lyrate pinnated with toothed acute lobes, Stem hirsute, Pedicels shorter than deciduous calyx
9285 Lvs. pinnatifid, Lobes acute nearly entire, Stem hirsute, Calyx persistent somewhat bladdery

9289 The only species

9290 The only species

9291 Long filaments forked, Pod blunt, Leaves roundish sinuated wavy toothed glauc. and stem quite smooth
9292 Long filaments forked, Pod blunt, Leaves pinnatifid with obl. acute toothed lobes, Stem smooth
9293 Long filaments forked, Pod blunt smooth, Leaves pinnatifid toothed rough, Stem smooth [smoothish
9294 Long filam. forked, Pod blunt, Rad. lvs. decompound, Pinnæ cut toothed: younger rough; old and stem
9295 Long filam. forked, Pod blunt rugose, Lvs. pinnated with obl. lin. toothed lobes and stem rough
9296 Long filam. forked, Pod nearly blunt, Lvs. stalked toothed: lower cord.; upper ov. and stem nearly smooth
9297 Long filam. toothed, Pod blunt, Lvs. lyrate rough, Terminal lobe cord. orbicular
9298 Long filam. scarcely toothed, Pod blunt, Lvs. pinnate-lyrate hairy, Terminal lobe ovate
9299 Long filam. toothed on one side, Pod mucronate, Lvs. lyrate pinnatifid toothed hoary
9300 Filam. not toothed, Pod mucronate, Lvs. ov. toothed unequal and somew. auricled at base and stem hispid

9301 Pods round torose acuminate scarcely longer than stalk

9302 Pods depressed acuminate decumbent longer than the whole plant
9303 Pods 1-celled jointed striated 3-8-seeded longer than the style, Lvs. simply lyrate
9304 Pods 1-celled jointed substriated 2-6-seeded longer than the subulate style, Lvs. interruptedly lyrate
9305 Pods 1-celled jointed striated 2-6-seeded, Style conical shorter than the last joint, Lvs. interrupted. lyrate

. and Miscellaneous Particulars.

and gravel, in March and April; when they cut them off under ground, as is done in gathering asparagus, and boil them as greens. About the middle of the last century the plant was first introduced into gardens, grown on deep sandy soil, and blanched either by sand, ashes, litter, or by covering with flower pots, earthen pots made on purpose, or any opaque cover. It is now almost as universal in good gardens as asparagus, and like it is forced either by taking up the roots and planting them on a hotbed, or in the border of a forcing house, or by covering or surrounding them with litter in the open garden. Before covering a bed with warm litter, each plant or stool of plants is covered with an earthenware blanching pot, or a wicker case, to keep off the dung from the young shoots, and to ensure their being blanched. No plant is so easily forced; and, unlike asparagus, it yields produce the first spring after raising from seed.

C. tataria is called by the Hungarians *Tatar-Kenyer* or Tartarian bread, and its root, stripped of the bark and sliced, is eaten with oil, vinegar, and salt. The boiled root is sweet, and eaten by children. The young shoots are boiled like those of sea kail, and have an excellent taste, but are stringy, which they would not be if well cultivated, which the plant appears to deserve.

1443. *Raphanus.* From ῥα, quickly, and φαινομαι, to appear, on account of the rapidity of its germination and arriving at perfection. R. sativus is a well known salad root, requiring a deep sandy soil to attain a large size. There are several varieties both of the spindle-shaped and globular rooted kinds, and a very distinct sort known as the black or Spanish radish. In the Horticultural Transactions, sixteen varieties are mentioned besides subvarieties, arranged as spring, summer, turnip, autumn, and winter radishes. They are all of easy culture, and the spring, summer, and turnip sorts force well on hot-beds, or on dung-beds covered with mats.

R. caudatus, or tree radish, is remarkable for the length of its pod, which is greater than the whole height of the plant. The young leaves of R. Landra are eaten by the inhabitants of Insubria as salad.

History, Use, Propagation, Culture,

1444. *Bunias.* From βυνος, a hill, because the plants grow upon exposed open situations. *Linn.*
1445. *Erucaria.* See Eruca, No. 1437. Plants with the habit of Cakile.
1446. *Heliophila.* From ἡλιος, the sun, and φιλεω, to love; a plant loving heat. All the species grow upon dry hot plains at the Cape of Good Hope. These are mostly beautiful annual or perennial plants.

9306 Pods 4-cornered: angles crested, Radical leaves runcinate
9307 Pods 4-cornered: angles crested, Leaves all lanceolate
9308 Pods ovate 2-celled not crested somewhat warted

9309 Pod style-bearing, Lvs. pinnated, Lobes linear: of the lower pinnatifid; of the upper entire
9310 Stigma sessile, Beak longer than pod, Lvs. pinnated thick, Lobes linear

9311 Smooth, Pods rounded narrowed at each end, Leaves linear subulate
9312 Smooth, Pods moniliform, Lower lvs. opp.: upper altern. cord. stem-clasping obl. entire
9313 Smooth, Pods moniliform pendulous, Lvs. pinnated in 3-5-pairs, Lobes linear entire
9314 Hispid, Pods linear, Lvs. hairy either linear entire or trifid at end and cuneate at base
9315 Hispid, Pods linear, Lvs. oval entire or here and there coarsely cut-toothed
9316 Smooth, Pods linear, Leaves pinnated, Lobes and rachis linear entire
9317 Downy, Pods linear spreading, Lvs. pinnated or bipinnated: lobes filiform
9318 Velvety, Pods linear nodding, Lvs. pinnated somewhat fleshy: lobes subfiliform furrowed above
9319 Smooth, Pods linear erect or pendulous, Lvs. fleshy half round
9320 Pods linear compressed velvety, Style thick conical smooth, Leaves oblong
9321 Pods compressed stalked, Leaves linear lanceolate

9322 The only species

9331 Flowers hexandrous, Leaves ternate and solitary, Leaflets lanc. lin. entire
9332 Unarmed, Lvs. 5: lower and floral 3; upper sessile ovate, Pod smooth as long as its stalk
9333 Flowers hexandrous, Leaves ternate, Leaflets oval-lanceolate
9334 Flowers hexandrous, Leaves ternate lanceolate blunt, Pods fusiform viscid
9335 Flowers hexandrous, Leaves simple ovate-lanceolate stalked
9336 Flowers hexandrous, Leaves simple lanceolate stalked, Stems procumbent
9337 Unarmed pubescent, Leaves 5-7: floral simple cordate, Pod the length of the stalk

and Miscellaneous Particulars.

1447. *Subularia.* From *subula*, an awl, on account of the form of the leaves. A curious little aquatic, not of common occurrence.

1448. *Cleome.* A name employed by Octavius Horatius, a Latin physician, who lived in the fourth century, to designate a plant resembling Sinapis, and growing in humid places. It appears to have had no relation to the modern plant.

Class XVI. — MONADELPHIA.

This class is distinctly characterized by the filaments being united together throughout the whole or a part of their length; and for the most part consists of plants belonging to the natural orders of Malvaceæ and Geraniaceæ. Of the former, the major part are of little moment, consisting, in a great measure, of weeds or worthless shrubs of various parts of the world. Among them, however, are some plants both of interest and ornament, especially the beautiful Astrapæa, and the various species of Bombax and Hibiscus. The Gossypium, so important as producing the material of cotton, and the Adansonia or Baobab tree of Africa, remarkable for its immense size and use as an article of food, are found in this class. The Geranium, Camellia and Passion flower are also genera of much beauty; the latter yielding the well known West Indian fruit called the Granadilla. The common Tamarind, with which this class commences, would more properly be placed in the next, and the succeeding genera of Patersonia, Tigridia, Ferraria, and Galaxia, are in every respect, except the union of their filaments, referable to the third class.

Order 1. TRIANDRIA. Stamens 3.

1449. *Tamarindus.* Petals 3, ascending. Three filaments longer than the others and fertile. Legumen 1-3-celled, pulpy inside.
1450. *Patersonia.* Cor. tubular. Limb 6-parted, with 3 small segments. Caps. 3-celled, inferior.
1451. *Ferraria.* Spatha 2-leaved. Cal. O. Petals 6, wavy, curled. Filaments united at base. Style 1. Caps. 3-celled, inferior.
1452. *Tigridia.* Spatha 2-leaved. Cal. O. Petals 6, the 3 outer large. Filaments united into a very long tube.
1453. *Galaxia.* Spatha 1-leaved. Cal. O. Corolla monopetalous, 6-cleft, with a long tube. Style 1. Capsule 3-celled, inferior.

Order 2. PENTANDRIA. Stamens 5.

1454. *Waltheria.* Cal. 5-fid, with a lateral deciduous 3-leaved involucre. Petals 5. Style 1. Stigma penciled. Caps. 1-celled, 2-valved, 1-seeded.
1455. *Hermannia.* Cal. nearly naked, campanulate, 5-fid. Pet. 5. Stamens 5. Filaments united at base, lanceolate, frequently winged. Styles 5, cohering in one. Caps. 5-celled, 5-valved, many-seeded.
1456. *Melochia.* Cal. 5-fid, naked, or with 1-3 bracteæ. Petals 5, spreading. Stam. 5, monadelphous at base. Styles 5. Caps. 5-celled. Seeds 1-2 in each cell.
1457. *Melhania.* Cal. 5-parted, persistent, with a 3-leaved involucre on one side. Pet. 5. Stam. 10, alternately sterile: the fertile ones bearing from 1-2 anthers each.
1458. *Ochroma.* Cal. double, outer 3-leaved. Petals 5. Anthers anfractuose. Capsule 5-celled, many-seeded. Seeds involved in wool.
1459. *Passiflora.* Cal. 5-parted, colored. Petals 5 or O, inserted in the calyx. Crown of many filiform rays. Fruit stalked, fleshy.
1460. *Erodium.* Cal. 5-leaved. Petals 5. Scales 5, alternate, with filaments and honey glands at the base of the stamens. Cocci 5, 1-seeded, awned, at the base of a rostrate receptacle.

Order 3. HEPTANDRIA. Stamens 7.

1461. *Pelargonium.* Cal. 5-parted, the upper segment ending in a nectariferous tube running down the peduncle. Cor. 5-petalous, irregular.

Order 4. OCTANDRIA. Stamens 8.

1462. *Aitonia.* Cal. 4-parted. Cor. 4 petals. Style 1. Berry dry, quadrangular, 1-celled, many-seeded.

Order 5. DECANDRIA. Stamens 10.

1463. *Geranium.* Cal. 5-leaved. Petals 5, regular. Glands 5, honey-bearing, united to the base of the longer filaments. Cocci 5, 1-seeded, awned, at the base of a beaked receptacle.

Order 6. DODECANDRIA. Stamens 12.

1464. *Brownea.* Cal. tubular, bifid. Cor. double: outer 5-fid; inner of 5 petals. Legumen 1-celled.
1465. *Monsonia.* Sepals 5. Pet. 5. Stamens 15, united; their cup 5-fid. Style 5-fid. Cocci 5, 1-seeded awned, at the base of a beaked receptacle.
1466. *Helicteres.* Cal. tubular, obliquely 5-fid. Petals 5. Germen on a long stalk. Style about 5-fid. Caps. 5, 1-celled, many-seeded, spirally twisted.
1467. *Dombeya.* Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are sterile. Style 5-fid. Caps. 5, united, 1-celled, 1-many-seeded.
1468. *Pentapetes.* Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are barren. Style obsoletely 5-toothed. Caps. 5-celled, many-seeded, with contrary dissepiments.
1469. *Astrapæa.* Flowers umbellate, with an involucre. Involucre many-leaved, unequal. Cal. simple, 5-leaved, with 1 bract. Petals 5, convolute-closed. Stamens 25, united into a tube bearing the corolla: 5-sterile.
1470. *Pterospermum.* Cal. simple, 5-parted. Petals 5. Stamens 20, of which 5 are sterile. Style cylindrical, Stigma thickish, Caps. woody, 5-celled. Seeds winged.

Order 7. POLYANDRIA. Stamens indefinite in number.

1471. *Malope.* Cal. double, outer 3-leaved. Capsules heaped without order, 1-seeded.
1472. *Malva.* Cal. double, outer 3-leaved. Capsules many, 1-seeded.
1473. *Kitaibelia.* Cal. double, outer 7-9-fid. Caps. clustered in a 5-lobed head, 1-seeded.
1474. *Althæa.* Cal. double, outer 6-9-fid. Capsules many, 1-seeded.
1475. *Lavatera.* Cal. double, outer 3-fid. Capsules many, 1-seeded.
1476. *Malachra.* Common calyx 3-leaved, many-flowered, large. Caps. 5, 1-seeded.
1477. *Urena.* Cal. double, outer 5-fid. Capsule 5-celled, 5-partible, with close 1-seeded cells.
1478. *Pavonia.* Cal. double, outer many-leaved. Stigmas 10. Capsules 5, 2-valved, 1-seeded.
1479. *Achania.* Cal. double, outer many-leaved. Cor. convolute, closed. Stigmas 10. Berry 5 celled, 5-seeded.
1480. *Hibiscus.* Cal. double, outer many-leaved. Stigmas 5. Capsule 5-celled, many-seeded.
1481. *Gossypium.* Cal. double, outer 3-fid. Caps. 5-celled. Seeds enwrapped in wool.
1482. *Redoutea.* Cal. 5-parted, surrounded by a 10-12-leaved involucre. Stigmas 3. Capsules 3-celled, 3-valved, many-seeded, with three placentas alternate with the valves, and bearing on each side woolly seeds.
1483. *Palavia.* Cal. naked, 5-fid. Capsules many, 1-seeded, united in a head without order.
1484. *Cristaria.* Cal. naked, 5-fid. Fruit orbicular, depressed, covered with a skin, and consisting of several carpella, 2-winged in the centre, and many-seeded.
1485. *Anoda.* Cal. naked, 5-fid. Lobes acuminate, much spreading in fruit. Caps. hemispherical beneath, depressed and stellate above, many-celled, with 1-celled, 1-seeded divisions.
1486. *Periptera.* Cal. naked, 5-fid. Petals erect, spirally twisted in the tube, at length distinct. Capsule stellate, many-celled, with 1-seeded cells.
1487. *Sida.* Cal. simple, angular. Style many-parted. Capsules several, 1 or 3-seeded.
1488. *Lagunæa.* Cal. simple, 5-fid. Style 5-fid. Capsule 5-celled, with contrary dissepiments.
1489. *Ruizia.* Cal. double, outer 3-leaved. Styles 10. Caps. 10, 1-celled, 2-seeded, closely cohering.
1490. *Carolinea.* Cal. simple, subtruncate. Filaments branched. Style very long. Stigmas 6. Caps. woody, 1-celled, many-seeded.
1491. *Adansonia.* Cal. simple, deciduous. Style very long. Stigmas many. Caps. woody, 10-celled, many-seeded, with a farinaceous pulp.
1492. *Bombax.* Cal. 5-fid. Stamens 5, or many. Caps. woody, 5-celled, 5-valved. Seeds woolly. Receptacle 5-cornered.
1493. *Myrodia.* Cal. naked, tubular, 4-5-toothed, bursting laterally. Petals oblong, linear. Stamens with a long column. Anthers 10-15. Capsule drupaceous, 2-3-celled, with 1-seeded cells.
1494. *Gordonia.* Cal. simple. Style 5-cornered, with a 5-fid stigma. Caps. 5-celled. Seeds twin, with a leafy wing.
1495. *Stuartia.* Cal. simple, rotate. Petals 5. Styles 5, united or distinct. Caps. 5-celled, 5-valved. Seeds solitary or twin.
1496. *Camellia.* Cal. imbricated, many-leaved, the inner leaflets largest.
1497. *Barringtonia.* Cal. 2-leaved, superior. Petals 4. Drupe dry, large, quadrangular, with a 4-celled nut.
1498. *Gustavia.* Cal. 4-6-fid. Petals 4-6. Berry dry, 4-5-celled.
1499. *Careya.* Cal. superior, 4-fid. Petals 4. Berry many-seeded. Seeds nestling in pulp.

History, Use, Propagation, Culture,

1449. *Tamarindus.* Latinized from the Arabic name *Tamer-hindy*, or Indian date. This tree is a native of the East and West Indies, of Arabia, and Egypt. It is a large beautiful spreading tree. The leaves are abruptly pinnate, composed of sixteen or eighteen pairs of sessile leaflets, half an inch only in length, and one sixth of an inch broad, of a bright green color, downy, oblong, entire, and obtuse: the flowers are in loose bunches of five or six, which come out from the sides of the branches: the calyx is of a straw yellow color, and deciduous: the petals also yellowish, and beautifully variegated with red veins; ovate, concave, acute, indented, and plaited at the edge; and the filaments purplish, bearing incumbent brownish anthers: the pods are thick, compressed, and of a dull brown color when ripe: those from the West Indies from two to five inches long, with two, three, or four seeds: those from the East Indies are twice as long, and contain five, six, or seven seeds: the seeds in both are flat, angular, shining, and lodged in a dark pulpy matter.

In the West Indies, the pods are gathered in June, July, and August, when fully ripe; and the fruit being freed from the shelly fragments, is placed in layers in a cask, and boiling syrup poured over it, till the cask is filled; the syrup pervades every part quite down to the bottom; and when cool the cask is headed for sale. (*Long's Jamaica*, iii. 729.) The East India tamarinds are darker colored and drier, and are said to be preserved without sugar. Tamarinds are inodorous, and have an agreeable acid sweetish taste. The acid taste chiefly depends on the citric acid, the quantity of that being greater than of the other. The pulp is refrigerant, and gently laxative. The simple infusion of the pulp in warm water, or a whey made by boiling it in milk, forms a very grateful refrigerant beverage, which is advantageously used in febrile diseases. The dose of the simple fruit required to act upon the bowels is so large, that it is seldom given alone as a purgative, but is generally combined with cassia or manna, the action of which it augments, or with such of the neutral purgative salts as are not decomposed by it; which is the case with those that have potass for their base, and are therefore incompatible in mixtures with this fruit. (*Thompson's London Dispensatory*, 534.)

The plants thrive in loam and peat, and root under a glass in sand. They form handsome objects, but in our stoves are seldom allowed sufficient room to flower. Miller says, he had several plants twenty years old, and upwards, of fifteen feet high, which never had shewed blossoms.

TRIANDRIA.

9338 The only species

9339 Stigma deflexed, Scape and spathes silky, Leaves ensiform straight striated
9340 Stigma deflexed, Scape and spathes smooth shining, Keel of leaves woolly at base

9341 Stem branched, Leaves equitant ensiform equal wavy; inner twice as narrow as the outer
9342 Stem simple, Leaves equitant ensiform; lower narrow

9343 Stem simple wavy, Leaves ensiform nerved, Petals flat; inner small panduriform

9344 Almost stemless, Leaves oblong, Spathe 1-valved 1-flowered

9345 Almost stemless, Leaves linear filiform dilated at base, Spathe 1-valved 1-flowered

PENTANDRIA.

9346 Leaves oval plicate acutely and unequally toothed downy, Heads stalked
9347 Leaves oval plicate bluntly toothed downy, Heads sessile
9348 Leaves lanceolate oblong blunt plicate toothed downy, Heads sessile
9349 Leaves ovate mucronate serrate and stem quite smooth, Heads stalked, Calyxes ciliated

9350 Leaves ovate downy plicate crenate, Lower stipules ovate; upper broad lanceolate, Cal. angular
9351 Lvs. downy hairy ovate subcord. rugose denticulate, Stipules ovate acute, Cal. in fl. cylind. finally inflated
9352 Leaves oval unequally crenate subpubescent, Stipules ovate acute often cut, Stem glandular pubescent
9353 Leaves whitish downy round ovate crenate, Stipules lanceolate subulate, Cal. campanulate spreading
9354 Leaves hispid-villous roundish-ovate blunt toothed, Stipules subovate acuminate, Cal. angular
9355 Leaves downy hispid rugose oblong blunt entire subsessile, Stipules long lanceolate subulate, Fls. naked
9356 Lvs. downy hispid somew. rugose obl. very blunt a little toothed at end with short stalks, Stip. lanc.subul.

and Miscellaneous Particulars.

1450. *Patersonia.* Named after Colonel William Paterson, a gentleman whose remarks on the Cape of Good Hope, New Holland, and Norfolk Island, have been of much service to botany. Handsome plants, which grow readily in loam and peat, and are increased like other herbaceous vegetables.

1451. *Ferraria.* Named after Jean Baptiste Ferrari, an Italian botanist, author of a work on the culture of flowers, published in 1633, &c. According to Sweet, "a mixture of sandy loam and peat is the best soil for the species, and they should be kept without water, after they have done growing, till they begin to grow again, when they may be planted in fresh pots and regularly watered: they are increased by offsets from the bulbs, or by seeds." (*Bot. Cult.* 192.)

1452. *Tigridia.* In allusion to the spotted flowers, which are marked something like the skin of a tiger. Splendid plants, and tolerably hardy. They do best when planted in the soil and protected by a frame or hand-glass; but will also thrive in sheltered borders, provided they are protected from the winter's frost. They ripen seeds, from which, or from offsets, they may be readily increased.

1463. *Galaxia.* Thunberg, the author of the name, has not explained its meaning. Like other plants of the bulbous kind, these should be kept dry after flowering and seeding. At the return of the growing season, they should be fresh potted, and kept in a cool part of the greenhouse till they are well rooted, when they may be put into a warmer situation and regularly watered. They seed freely.

1454. *Waltheria.* In memory of Augustin Frider. Walther, professor of medicine at Leipsic; author of Hortus Proprius, 1735. The species grow in any light rich soil, and are readily propagated. They are of no importance.

1455. *Hermannia.* In memory of Paul Hermann, who practised physic in Ceylon, and at the Cape of Good Hope, and was afterwards professor of botany at Leyden. He was born in 1640, at Halle, in Saxony, and died in 1695. The species are low shrubs, for the most part, with wrinkled leaves and yellow flowers, which they produce in abundance. They grow freely in any light rich soil, and are readily increased in the same soil.

History, Use, Propagation, Culture,

1456. *Melochia.* According to Forskahl, it is an alteration of the Arabic name *melochieh*, or *melokhieh*. Light rich soil suits all the species, and they strike readily in moist heat.

1457. *Melhania.* A plant which grows upon Mount *Melham*, in Arabia. Pretty plants, which grow in sandy loam, and root in sand under cover. Sweet observes, that "they are very apt to become covered with insects."

1458. *Ochroma.* From ὠχρος, yellow, the flowers being of that color, according to Schreber. O. Lagopus is a very large tree, with divaricating branches, and leaves more than a foot long. The wood is white, tender, and so light, that it is used instead of corks to nets. The capsules contain a very soft fine rufous down, in which the seeds are involved, and which down is said to be used in the manufacture of English beavers. (*Desportes Plantes de S. Domingue*, iii. 16.)

1459. *Passiflora.* This genus has been so named, on account of its being supposed to represent, in the appendages of its flower, the passion of Jesus Christ. A beautiful genus of climbers, partly herbaceous, but chiefly suffrutescent or woody; and all of them exotics and very ornamental. Some species are odoriferous; others bear edible fruits, fleshy juicy berries of considerable size, though not rich in flavor. Of late, a number of hybrid sorts have been raised, some of which, as P. cæruleo-racemosa, are considered more beautiful than almost any of the natural species.

P. maliformis, the sweet calabash of the West Indies, produces large flowers, red, white, and blue, but of short duration. They are succeeded by fruit, roundish, the size of a large apple, yellow when ripe, having a thicker rind than any of the other sorts; inclosing a sweetish pulp, in which are lodged many oblong black seeds, of a brownish color, a little rough to the touch. It grows naturally in the West Indies, where the inhabitants call it Granadilla. The fruit is served up there in desserts. It has borne fruit in the garden of the Bishop of Durham in Oxfordshire, and at Vere's, Kensington Gore. (*Hort. Trans.* iii. 101.)

P. quadrangularis, the Granadilla vine of the French, has leaves five or six inches long, and luxuriant four-

9357 Leaves stalked oval blunt wavy crenate and stem hairy, Stipules lanceolate
9358 Leaves downy hispid oblong acutish entire subsessile, Stipules lanceolate subulate, Flowers aggregate
9359 Leaves downy beneath oblong blunt crenate stalked, Stipules subulate, Pedic. 1-2-fl. Calyxes spreading
9360 Leaves soft with down whitish obl. blunt toothed cuneate at base entire, Pedunc. 2-fl. Cal. campan. velvety
9361 Leaves smooth lanceolate serrate at end acute, Stipules ovate acuminate, Pedic. 2-4-flowered
9362 Leaves white with down lanceolate serrate bluntish wavy at edge, Stipules subul. Pedunc. 1-fl. very short
9363 Leaves smooth broadly obovate cuneiform very blunt crenate emarginate plicate, Stip. lanc. subulate
9364 Leaves pubescent obovate cuneiform truncate emarginate toothed, Stipules ovate acute
9365 Leaves soft white with down oblong cuneiform rounded at end toothed, Stipules lanceolate
9366 Leaves pubescent downy oblong unequally toothed rounded at each end, Stipules ovate somew. toothed
9367 Leaves beneath white with down oblong obov. cuneiform unequally toothed at end, Stip. ½ cord. acum.
9368 Leaves rough above downy beneath cuneif. obl. unq. toothed entire at base, St.p. half cordate acuminate
9369 Leaves smoothish cuneiform oblong truncate toothed at end, Stipules oblong acute, Racemes few-flow.
9370 Leaves smooth cuneiform lanceolate truncate toothed at end, Calyxes reflexed
9371 Leaves smooth above hairy beneath cuneiform lanceolate truncate toothed at end
9372 Leaves pubescent cuneiform lanceolate blunt toothed at end, Calyx inflated downy
9373 Leaves velvety cuneiform linear blunt entire or 3-toothed at end, Cal. campanulate
9374 Leaves velvety cuneiform lanceolate blunt: upper entire; lower 3-5-toothed at end, Stipules lin. subul.
9375 Leaves velvety lanceolate blunt entire, Stipules linear subulate, Calyxes angular
9376 Leaves smooth rough at edge linear 3-cornered entire, Stipules large lanceolate
9377 Leaves white with down sess. cuneate obcord. somew. crenate at end, Stip. obl. blunt resembling lat. lvs.
9378 Leaves smoothish oblong toothed pinnatifid: lower ovate; upper elongate, Stem procumbent
9379 Leaves rough with scattered down linear-cuneiform coarsely toothed, Stipules linear entire
9380 Leaves roughish white bipinnatifid, Pedunc. 2-flowered very long
9381 Leaves pinnatifid with linear lanceolate entire segments, Petals cut-toothed
9382 Leaves linear pinnatifid fleshy smoothish, Stem pubescent
9383 Leaves pinnatifid with linear entire acute lobes

9384 Leaves ovate lanc. toothed smooth, Pedunc. 5-6-fl. longer than petiole, Branches downy in decurrent lines
9385 Lvs. uneq. sided ovate obl. acutely crenate plaited hoary on each side, Umbels 5-8-fl. longer than petiole
9386 Leaves cordate crenate downy beneath, Fl. capitate subsessile axillary and opposite the leaves
9387 Leaves ovate somewhat lobed serrated smooth, Flowers subterminal capitate sessile

9388 Leaves ovate cordate subpeltate acuminate crenulate beneath downy and reticulated
9389 Leaves cordate entire downy on each side

9390 Leaves cordate somewhat 3-lobed repand subtomentose
9391 Leaves cordate 5-angled somewhat lobed toothletted pubescent beneath

9392 Leaves ovate veiny subserrulate, Petioles with 2 glands, Invol. 3-leaved
9393 Leaves elliptical entire blunt 3-nerved, Petioles without glands, Invol. 0.
9394 Leaves oblong ovate cordate 3-nerved veiny entire, Petioles with 2 glands, Invol. 3-leaved larger than fl.
9395 Leaves 3-lobed peltate, Petioles with 4 glands, Flowers terminal racemose
9396 Leaves obl. ovate subcord. entire veiny, Petioles with 6 glands, Stipules roundish ovate, Invol. 3-leaved

and Miscellaneous Particulars.

cornered ligneous stems. The flowers are red within, and white outside; they are odoriferous, and generally the plant is covered with fruits and flowers at the same time, which makes a fine appearance. The fruit, Sabine describes (*Ho t. Trans.* iii. 100.) as very large, of an oblong shape, about six inches in diameter, from the stalk to the eye, and fifteen inches in circumference. It is externally of a greenish-yellow when ripe, soft and leathery to the touch, and quite smooth; the rind is very thick, and contains a succulent pulp of a purple color (which is the edible part), mixed with the seeds in a sort of sack, from which it is readily separated. Wine and sugar are commonly added to it when used. The flavor is sweet and slightly acid, and it is very grateful to the taste, and cooling in a hot climate. It has been successfully cultivated for its fruit in a few places, as at Lord Harewood's, Farnley Hall, &c. (*Hort. Trans.* iv. 60.)

P. laurifolia, the water lemon, *Pomme de Liane*, Fr., has a suffrutescent stem, with divaricating filiform branches, oval smooth leaves, and very long tendrils. Flowers red and violet, sweet-scented; the fruit about the size of a hen's egg, but rather more elongated, and tapering equally at both ends; when ripe, it is yellow and dotted over with white spots; it contains a whitish watery pulp, which, in the West Indies, is usually sucked through a small hole made in the rind; the rind is tough, soft, and thin; the juice has a peculiar aromatic flavor, is delicately acid, and allays thirst agreeably. It is grown in our stoves, but has not yet been cultivated for its fruit.

P. normalis has berries about the size of small grapes. The root has been extolled as a counterpoison and diuretic.

P. Murucuja produces fruit of an oblong oval form, about the size of a large olive, and flesh-colored when ripe. Both the syrup and decoction of the plant are much used in the leeward parts of Jamaica, where it is frequent; and they are said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use: they are commonly infused in, or pounded and

History, Use, Propagation, Culture,

mixed immediately with wine or spirits; and the composition is generally thought a very effectual and easy narcotic.

P. incarnata, the May apple, has a perennial root, herbaceous shoots, and sweet-scented flowers, variegated with purple. The fruit is about the size of an apple, orange-colored, with a sweetish yellow pulp, but it requires the heat of the stove to bring it forward.

P. cærulea is the tallest and most ligneous of the species. The stem will grow almost as large as a man's arm, and the shoots will often grow the length of fifteen feet in one summer. The leaves are the most elegant of the genus. The flowers are blue outside, and purple and white within: they have a faint scent, and continue but for one day. The fruit is egg-shaped, of the size and color of the Mogul plum, the yellow skin of which encloses a sweetish disagreeable pulp and black seeds.

Besides the species thus enumerated, some varieties have been procured by cross impregnation, which are very remarkable for their beauty, and for having acquired the hardihood of their parent. The most valuable of these artificial productions, is the P. cæruleo-racemosa, raised by Mr. Milne, of Fulham, from seed of P. racemosa impregnated by P. cærulea, and figured in the Transactions of the Horticultural Society, vol. 3. tab. 3., and the P. alato-cærulea, obtained by Mr. J. H. Masters of Canterbury, between P. alata of the West Indies, and P. cærulea.

All the species grow and flower freely in a mixture of loam, and light rich earth or peat, with plenty of room. Most of them fruit in the stove, but the P. cærulea seldom fruits in the greenhouse. They are all easily increased either by seeds or very young cuttings, in a close moist heat.

As fruit-bearing plants the Passifloras are thus treated:—"Having procured plants with good roots, plant such as are intended to fruit in a border in the stove, and train them to a trellis near the glass; they will in general produce fruit the second year. The seedlings of the P. incarnata, will produce fruit the first year. All the species will fruit even in large pots; but Sabine says, the "best method is to plant them in an angle of the bark-bed, which has been parted off, either by boards or brick-work, as low as the pit goes. At the bottom of

9404 Lvs. cord. 2-lobed blunt smooth, Petioles without glands, Pedunc. axillary twin, Threads of corona clav.
9405 Leaves cuneiform acuminate divaricating with 2 glands at base, Petioles without glands, Invol. O.
9406 Lvs. round. shortly and bluntly 3-lobed dott. downy ben. Petiol. without glands, Pet. twice as short as cal.
9407 Lvs. round. subcord. blunt obsoletely 3-lobed smooth dott. Petioles without glands, Pet. twice as short as cal.
9408 Lvs. cord. 3-lobed blunt smooth, Petioles without glands, Pedunc. axill. twin, Pet. twice as narrow as cal.
9409 Lower leaves 3-lobed acuminate ; upper undivided lanceolate, Petioles with 2 glands, Flowers apetalous
9410 Leaves roundish cordate, Petioles with 2 glands, Flowers solitary long-stalked, Cal. keeled, Stam. 1-sided
9411 Leaves ovate entire 3-nerved veiny, Petioles with 2 glands, Flowers apetalous, Involucrum O.
9412 Lvs. 3-lobed smooth, Lobes lanc. ; middle one longest, Petioles with 2 glands, Fl. apetal. Stem corky at base
9413 Leaves subcordate 3-lobed, Lobes rounded with 2 glands, Pedunc. axillary solitary, Flower apetalous
9414 Lvs. 3-lobed smooth, Lobes oblong ; lat. very short, Petioles with 2 glands, Fl. apetal. Stem corky at base
9415 Lvs. peltate deeply 3-lobed smooth, Lobes lin. lanc. divaricating, Petioles with 2 glands, Flow. apetalous
9416 Leaves peltate half 3-lobed smooth, Lobes ovate blunt, Petioles with 2 glands, Fl. apetalous
9417 Leaves peltate cordate 3-lobed, Lobes equal oblong blunt, Petioles with 4 glands, Petals length of calyx

9418 Leaves discolored peltate
9419 Leaves 3-lobed downy with a reflexed tooth on each side at the base
9420 Leaves 3-lobed vill. ; lower smooth above, Lobes obl. entire ; intermediate longest, Petioles with 2 glands
9421 Leaves 2-lobed glandular beneath, Lobes oblong erect, Peduncles twin
9422 Leaves palmate about 5-parted subserrulate, Involucre 3-leaved entire, Rays a little shorter than corolla
9423 Leaves 3-lobed cordate hairy, Involucres multifid capillary
9424 Leaves and stems all fringed with red hairs
9425 Leaves 3-lobed cordate smooth ciliated serrated, Involucres multifid capillary
9426 Downy, Leaves cordate 3-lobed, Peduncles twice as short as petiole, Corona much shorter than corolla
9427 Lvs. rounded trun. at base slightly 3-5-lobed, Lobes blunt, Petioles without glands, Pet. shorter than cal.
9428 Stem square, Leaves 3-lobed : lobes nearly equal serrated, Pedunc. long 1-flowered
9429 Leaves 3-lobed serrated smooth, Invol. glandular serrulate caducous, Ovary naked
9430 Lvs. 3-lobed serr. Lobes obl. acute, Petioles with 2 glands, Inv. 3-leaved, Threads of corona longer than cor.
9431 Lvs. palmate 5-parted entire, Petioles gland. Invol. 3-leaved entire, Threads of corona shorter than corolla

9432 Leaves palmate 5-parted serr. Petioles gland. Invol. 3-leaved serrate, Threads of corona longer than cor.
9433 Leaves palmate 7-parted serrated, Petioles glandular, Invol. 3-fid entire
9434 Leaves 7-pedate serrated, Petioles glandular, Invol. 3-leaved serrated
9435 Upper leaves quinate pedate obovate somewhat cut ; lower ternate linear-lanceolate or simple

and Miscellaneous Particulars.

the cavity formed by this division, should be laid some brick-rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung. Herein the roots will strike freely, and will even spread through the partition into the pit, growing into the fresh tan. Such roots may be trimmed and reduced whenever the tan is changed; but should the plant have been some time in its station, it will be as well to leave part of the old tan in the bottom of the pit, in which the protruded roots may remain undisturbed. They do not require the full heat of the pine stove, for they flourish best in a temperature of from sixty-five to seventy degrees ; but they do not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots, as they advance, must be trained near to and under the inclined glass of the stove: the flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time ; but if it does not set well, it will be advisable to impregnate the stigmas by applying the pollen with a feather. As they grow, the very strong shoots should be cut out from their origin, for these do not bear fruit so abundantly as those which are less vigorous ; but the fruiting branches must not be shortened on any account. The temperature must be kept up equally during the time of flowering and fruiting. The crop will begin to come in in August, and will continue until January; but the earlier produce is the best. When the crop is all off, which will be early in January, the heat must be reduced to about fifty degrees, so as to check or stop the growth ; this being effected, the shoots must be well cut in. As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about two or three feet of each) of the old branches should be retained ; for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season. It is found that the shoots break better, and in greater quantity, from the older wood than from that of two years' standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season." (*Hort. Trans.* iii. and iv.)

History, Use, Propagation, Culture,

1460. *Erodium.* From ερωδιος, a heron, because the fruit resembles the head and breast of that bird. The species are hardy plants, of common treatment, and no great beauty.

1461. *Pelargonium.* So called from πελαργος, a stork, in allusion to the beak of the fruit, which resembles the bill of that bird; as well as to preserve an analogy with the Geranium or Crane's-bill. It was detached by the late learned botanist Mons. L'Heritier, along with Erodium, from the Linnean genus Geranium; and distinguished by its seven fertile stamens, irregular flower, tubular nectary, and spiral-leaved awns, or beaks to the capsule.

"This vast and favorite genus, for which we are almost entirely indebted to the Cape of Good Hope, consists of a number of well marked species. But that number is greatly augmented in almost every book, by the admission of spurious hybrid species or varieties, which continually start up from seed, wherever many of the primary ones are cultivated, and are for a while propagated by cuttings, and even by seed. Sooner or later,

9436 Stemless, Peduncles many-fl. Lvs. smoothish pinnat. Segm. pinnatifid, Petals retuse twice as long as calyx
9437 Stemless, Peduncles many-fl. Lvs. downy gland. pinnat. Segm. pinnatif. Petals acute twice as long as calyx
9438 Stem smooth. branch. Ped. many-fl. Lvs. smooth. bipinnatif. Lobes lin. Pet. blunt long. than long-point.cal.
9439 Stem branched diffuse downy, Lvs. thick pinnatif. cut, Lobes linear, Pedunc. many-fl. Bractes ovate scariose
9440 Stem prostrate, Leaves bipinnate with linear acute lobes, Stipules and bractes ovate scariose, Ped. many-fl.
9441 Stem ascend. and lvs. somew. villous pinnated, Seg. blunt pinnatif. tooth. Ped. many-fl. Pet. length of calyx
9442 Stem prostrate or diffuse hairy, Leaves pinnated, Segm. sess. pinnatifid cut, Pedunc. many-fl. Pet. unequal
β Caulescent diffuse, Segments pinnated with linear lobes
9443 Nearly stemless, Leaves pinnate with ovate pinnatifid segments, Petals equal larger than calyx
β Plant of larger size
9444 Stem procumbent, Leaves pinnated with stalked ovate unequally serrated segm. Pedunc. downy glandular
9445 Stem erect nearly smooth, Leaves 3-cut, Segments cut-toothed, Pedunc. many-fl. Calyx striated nerved
9446 Stem erect somewhat diffuse, Leaves smooth subcordate; upper 5-parted with cut toothed lobes
9447 Stem erect branch. shrubby at base, Lvs. 3-lobed or 5-parted very blunt, Stipules and bractes scariose ovate
9448 Stem erect soft, Pedunc. many-fl. Leaves cordate blunt bluntly toothed undivided or 3-lobed
9449 Stem branched hairy, Leaves cordate undivided or 3-lobed blunt toothed, Petals length of calyx
9450 Stem ½ shrubby and leaves nearly smooth; lower cord. undivided toothed, Lobes cuneate 3-toothed at end
9451 Stem erect and leaves smooth oblong lobed crenate fleshy, Awns feathery from middle to end
9452 Caulescent diffuse smooth, Leaves cordate ovate cut-crenate pubescent, Awns beardless
9453 Stemless, Leaves cordate crenate blunt smoothish, Pedunc. 1-fl. Petals larger than calyx
9454 Caulescent diffuse smoothish, Leaves cordate roundish 3-lobed unequally crenate, Awns bearded
9455 Stems diffuse, Leaves opposite 3-cut: segm. lateral cut-toothed divaricating, Peduncles many-flowered

HEPTANDRIA.

§ 1. HOAREA. Sweet. *Petals 5, rarely 2 or 4 obl. lin., 2 upper parallel, with long claws abruptly reflexed in the middle. Stamens in a long tube, length of lower petals, bearing 5 or rarely 2-4 anthers, the others sterile, straight or incurved at end, the 3 lower shorter than the fertile ones. Stemless herbs, with tuberous turnip-like roots, and radical stalked leaves.*

* *Leaves oblong, entire or lobed. Lobes entire or scarcely toothed.*

9456 Stemless, Leaves lanceolate entire acute smooth; older pinnatifid linear, Umb. comp. Fl. tetrandrous
9457 Stemless, Leaves lanceolate entire acute smooth, Umb. comp. 4-fl. Fl. tetrandrous, Petals linear
9458 Leaves oval or oval-oblong blunt flat or involute at edge entire hairy, Petals linear wavy twisted
9459 Stemless, Leaves ellipt. lanc. or obl. ent. hairy revol. at edge, Fl. pentandr. Pet. lin. spatul. wavy reflexed
9460 Stemless, Leaves ovate acute entire subciliated, Umb. compound, Fl. pentandrous, Petals linear spatulate
9461 Stemless, Leaves ovate toothed smooth, Umb. compound, Fl. diandrous, Pet. linear; 3 lower shortest
9462 Stemless, Leaves oval obl. entire acute at each end smooth ciliated, Umb. simple, Flowers pentandrous
9463 Stemless, Lvs. obl. subspatul. blunt smooth, Umb. comp. Fl. pentandrous, Petals lin. blunt subrevolute

9464 Stemless, Leaves elliptical spatulate entire smooth, Umb. compound, Fl. pentandrous, Petals cuneiform
9465 Stemless, Lvs. ellipt. ovate acute at each end smooth, Umb. subcomp. Fl. pentandrous, Pet. lanc. cuneate
9466 Stemless, Leaves lin. lanc. entire ciliated, Umb. simple, Flowers pentandrous, Petals wavy nearly equal
9467 Stemless, Leaves linear lanceolate repand, Umbel nearly simple, Flowers pentandrous, Petals linear
9468 Stemless, Lvs. smooth: lower ovate ent.; upper pinnatif. Petals reflexed; lower ones much the smallest

** *Leaves sagittate, cordate, 3-lobed, or with an appendage at base.*

9469 Stemless, Leaves cordate blunt nerved entire, generally with two ears at base, Leaves of invol. revolute
9470 Stemless, Lvs. obl. lanc. acum. at each end hairy ciliat. at edge, generally ent. somet. with 2 obl. lin.append.
9471 Stemless, Leaves entire and cut-lobed at end, Scape flexuose, Umbel compound
9472 Stemless, Leaves ciliated 3-cut: segm. ovate blunt, Umbel compound
9473 Stemless, Leaves smooth 3-cut: segm. blunt lobed nerved glauc. beneath, Scapes hispid, Umbel compound
9474 Stemless, Leaves smooth 3-cut: segm. blunt crenated, Scapes and petioles downy
9475 Stemless, Leaves smooth 3-cut: segm. lobed cut recurved, Two upper filaments and stigmas reflexed
9476 Stemless, Leaves cut-lobed downy, Umb. simple close, Three lower petals much the smallest

and Miscellaneous Particulars.

however, they for the most part vanish, even before the eyes of those who witnessed their origin." (*Smith.*)

The greater part of the species being of the easiest cultivation, and many bearing the confined air of a sitting room better than most plants, it has happened that they have become objects of universal cultivation and attention; of which, indeed, they are in many cases deserving, for their neatness and beauty alone. There is, however, an uniformity in their form, coloring, and foliage, for which the liveliest colors will scarcely compensate. The popular taste for the Pelargonium tribe, or for Geraniums, as they are commonly called, has been much aided by several splendid publications both in this country and abroad; and especially by the Geraniaceæ of Mr. Sweet, in which it is proposed to figure not only all the species formed by the hand of nature, but the multitudes of hybrid creations produced by the assistance of modern ingenuity. It is very doubtful whether any permament advantage is derived from the obtaining such of these productions as are truly

History, Use, Propagation, Culture,

hybrid; but it is quite certain, that to admit them into works of science, is replete with the greatest inconvenience, and can lead to no useful end. In the arrangement here adopted, all those kinds which are manifestly or avowedly artificial productions, are therefore placed at the end of the legitimate species in alphabetical order, an order much more commensurate with their importance, than an arrangement upon scientific principles.

**** Leaves pinnatifid. Segments cut or multifid.*

9477 Stemless, Leaves hairy bipinnated, Lobes linear somewhat blunt, Upper petals reflexed: lower connivent
9478 Nearly stemless, Lvs. bipinnated hairy, Lobes pinnati. cut multifid linear somewhat toothed, Fl. nodding
9479 Stemless, Lvs. hairy pinnated: segm. pinnatifid or trifid, Lobes linear acute
9480 Stemless, Lvs. pinnated: segm. trifid, Lobes linear acum. bearded at end, Pet. lin. blunt
9481 Stemless, Lvs. pinnated: segm. trifid cut at end naked, Pet. blunt all with an oblong spot
9482 Stemless, Lvs. pinnated pubesc: segm. cuneate 3-5-toothed at end, Teeth setose at end, Umb. compound
9483 Stemless, Lvs. pinnated smooth: segm. cut-lobed acute, Umb. simple, Petals emarginate
9484 Subcaulescent, Leaves pinnated or 3-cut: segm. obl. lanc. smooth entire ciliated at edge acum. at end
9485 Stemless, Lvs. pinnated: segments bipartite, Umbel compound
9486 Stemless, Lvs. pinnated hairy: segm. cut multifid, Umbel simple 4-6-fl. Petals linear
9487 Stemless, Lvs. pinnated: segm. lanc. linear, Umbel compound
9488 Stemless, Lvs. lanc. linear entire and pinnatifid, Umb. compound
9489 Stemless, Lvs. hairy ciliated obovate or lanc. entire or pinnatifid, Stipules adhering to petiole
9490 Nearly stemless, Lvs. hairy pinnated: segm. oval-obl. blunt subpinnatifid or toothed, Petals lin. blunt
9491 Stemless, Lvs. hispid entire or 3 cut, Umbel compound, Flowers dicœcious [at end
9492 Stemless, Lvs. downy: some obl. and entire; others pinnated, Upper sepal erect, Barren filam. incurved

§ 2. DIMACRIA. Lindl. *Petals 5. unequal, two upper connivent spreading at end. Stamens shorter than sepals, 5 fertile, two lowermost twice as long as the rest, upper very short; 5 sterile, very small, nearly equal. Stemless herbs, with a tuberous turnip-like root; leaves stalked pinnatifid.*

** Leaves pinnated, with an odd segment. Segments entire.*

9493 Stemless, Lvs. pinnated villous: segm. ovate in 2 or 4 pairs, Petals nearly entire flat
9494 Stemless, Lvs. pinnated hairy: segm. elliptical in many pairs, Petals wavy twisted at base
9495 Stemless, Lvs. pinnated smooth: segm. of 1 or 2 pairs obovate or oblong
9496 Stemless, Lvs. pinnated smooth: segm. of 2 or 3 pair obovate: the terminal ones confluent

*** Leaves pinnate, with an odd one. Segments lobed or multifid.*

9497 Nearly stemless, Leaves smooth pinnated: segments lobed blunt, Upper petals obcordate
9498 Stemless, Lvs. smooth bipinnated, Lobes trifid linear blunt, Scape simple

§ 3. CYNOSBATA. Dec. *Petals oval, nearly equal, almost twice as long as calyx. Stamens* 10 *erect, the* 5 *alternate ones bearing the anthers. Stems shrubby, erect.*

9499 Stem shrubby at base, Lvs. cordate 5-lobed hairy zoned, Lobes acutely toothed at end
9500 Stem shrubby branched, Lvs. cordate 3-lobed toothed hairy: middle lobe 3-lobed, Pedunc. 2-floweerd

§ 4. PERISTERA. Dec. *Petals nearly equal, as long as calyx, or a little larger. Stamens* 10, 5 *longer, nearly equal, or one only occasionally abortive,* 5 *alternate, very short, sterile, tooth like. Herbs with stems, and with the appearance of Erodium or Geranium.*

9501 Stems many diffuse, Lvs. cordate roundish many-parted, Lobes trifid, Lobelets linear blunt
9502 Caulescent procumbent, Lvs. cord. somewhat lobed crenate-toothed, Pedunc. 2-flowered
9503 Stems many procumbent, Lvs. cord. usually 3-parted or 5-lobed toothed, Pedunc. 3-5-flowered
9504 Much branched procumbent, Leaves ellipt. blunt hoary toothed, Pedunc. 2-flowered, Anthers 5
9505 Diffuse procumbent, Lvs. cordate somewhat lobed villous beneath, Peduncles many-flowered
9506 Diffuse procumbent, Lvs. cordate ovate villous 3-lobed toothed: upper sinuated, Umbel many-flowered

§ 5. OTIDIA. Lindl. *Petals oblong-linear, nearly equal, about twice as long as calyx, the two upper auricled at the base on the upper side. Stamens* 10, *erect,* 5 *fertile,* 2 *upper spatulate or subulate,* 3 *lower shorter. Stems shrubby, fleshy. Leaves alternate pinnated, fleshy. Flowers whitish.*

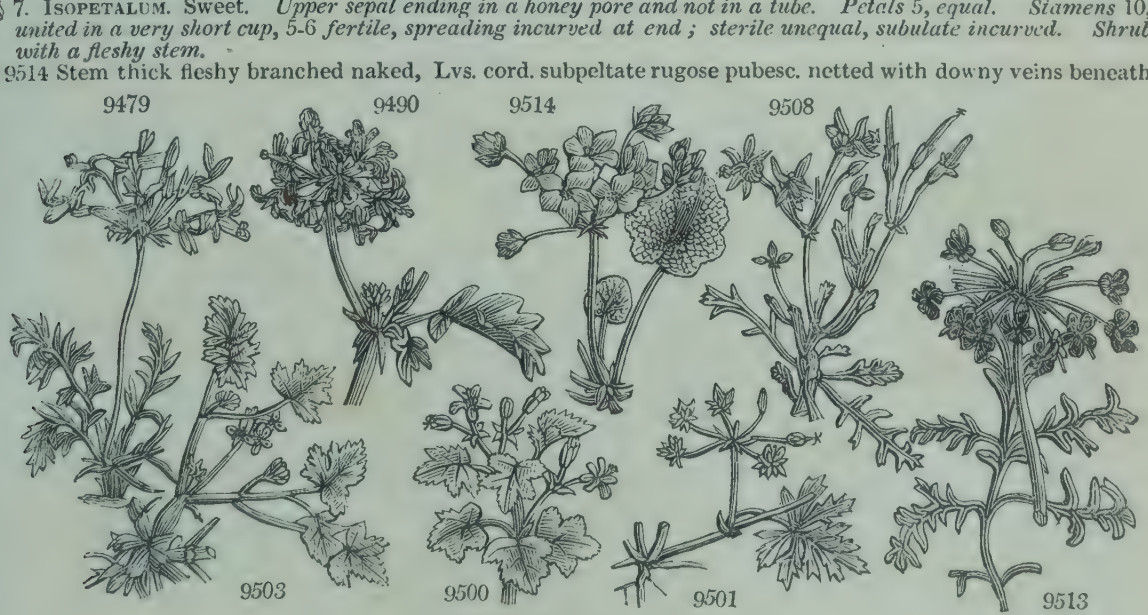
9507 Stem shrubby fleshy, Umb. many-flowered loosely panicled, Lvs. pinnated smooth, Petals somew. toothed
9508 Stem shrubby fleshy branched, Lvs. fleshy pinnated: lobes lin. round channelled entire or 3-toothed at end
9509 Stem shrubby fleshy warted, Lvs. fleshy pinnated: segm. cut pinnatifid subtrifid at end [at base
9510 Stem shrubby fleshy, Lvs. fleshy bipinnated: lobes dilated and cut at end, Pedunc. panicl. Upper pet. crisp
9511 Stem shrubby fleshy, Branches hairy, Lvs. pinnat.: segm. stalked subalternate wedge-shaped toothed at end
9512 Stem fleshy thick suffruticose at base, Lvs. smooth thick sinuate-pinnat.: segm. obl. blunt cut toothed at end

§ 6. POLYACTIUM. Dec. *Sepals nearly equal, revolute. Petals* 5, *nearly equal, obovate. Stamens* 10, 5 *fertile: the four lower long, subulate; upper broad, spatulate, reflexed at end; the fertile ones shorter, incurved at end. Petals with a very large dark brown spot which is scarcely edged with yellow.*

9513 Subcaulesc. Lower lvs. pinnat. hairy: segm. pinnati.; lobes obl. blunt cut-toothed; upper smoothish bipinn.

§ 7. ISOPETALUM. Sweet. *Upper sepal ending in a honey pore and not in a tube. Petals* 5, *equal. Stamens* 10, *united in a very short cup,* 5-6 *fertile, spreading incurved at end; sterile unequal, subulate incurved. Shrub with a fleshy stem.*

9514 Stem thick fleshy branched naked, Lvs. cord. subpeltate rugose pubesc. netted with downy veins beneath



and Miscellaneous Particulars.

The bulbous or fleshy stemmed species are generally very rare in collections, and are far more interesting than the common or vulgar kinds. They are distinguished by so peculiar a habit and constitution, that there can be little doubt of the propriety of separating them into one or more distinct genera, as has been done already by the authors quoted above; especially as the characters upon which they are founded, are generally more certain than those by which Erodium and Geranium are defined. Here, however, they are placed as

History, Use, Propagation, Culture,

sectional names, so as to present a double arrangement, in which the purposes of combination and analysis are both combined.

As the cultivation of Pelargonium generally is of the easiest kind, so is that of the bulbous rooted species of the most difficult nature. They require plenty of air and light, not to be over-watered, and a great deal of

§ 8. CAMPYLIA. Lindl. *Petals 5, unequal, two upper larger, with an auricled claw. Stamens 10, hairy or pubescent, 5 fertile, erect, 5 alternate sterile, of which the two upper are longer and hooked back. Herbs at the base a little shrubby, branched. Leaves stalked, ovate or oblong, toothed or cut.*

* *Petals with an appendage to the claw: 5 stamens fertile, erect; 5 sterile, of which the two uppermost are hooked backwards.* TRUE CAMPYLIA.

9515 Stem suffruticose erect, Lvs. ovate round blunt hoary silky toothed, Upper petals roundish : lower oblong
9516 Stem suffruticose erect, Lvs. ellipt. roundish blunt crenate silky, Upper pet. obovate sharply emarginate
9517 Stem suffruticose erect, Lvs. roundish ovate blunt doubly toothed silky, Upper petals round dark purple
9518 Stem herbaceous ascending, Lvs. obl. lanc. blunt toothed hoary, Pedunc. 1-5-fl. Upper petals obovate
9519 Stem suffruticose ascending, Lvs. lin. lanc. cut-toothed at end hoary beneath, Upper petals obov. oblong
9520 Stem suffruticose, Lvs. ovate plaited serrated downy, 3 upper petals very broad ovate
9521 Stem suffruticose ascending, Lvs. ovate unequally toothed or cut, Stipules carinate, Upper pet. oval wavy

** *Upper petals warted above the claw. Tube of stamens very short, 5 fertile recurved, spreading, 5 sterile straight.* PHYMATANTHUS. Lindl.

9522 Stem suffruticose erect, Lvs. lanc. villous cut-toothed trifid, Upper petals blistered at base

§ 9. MYRRHIDIUM. Dec. *Petals 4, or rarely 5, the two upper very large, obovate, cuneate, usually marked with branching lines, the two or three lower much smaller, oblong-linear. Stamens 10, with their tube and filaments straight, generally with 5 anthers, and 5 alternately barren, rarely 7 fertile. Biennial or perennial herbs rarely shrubby. Stems round. Leaves pinnate or ternate, often multifid.*

* *Anthers 5. Petals 4.*

9523 Stem suffruticose, Lvs. 3-parted, Lobes toothed at end blunt : lower obovate; middle ovate often trifid
9524 Stem herbaceous strigose ascending, Lvs. hispid on each side rigid pinnated, Lobes cut-toothed
9525 Stem herbaceous biennial somewhat downy, Lvs. bipinnate smooth, Lobes linear subpinnatifid

** *Anthers 5. Petals 5.*

9526 Stem herbaceous hairy suberect, Lvs. bipinnatifid, Segm. lanc. blunt toothed at end

*** *Anthers 7. Petals 4.*

9527 Stem herbaceous biennial hairy erect, Lvs. pinnated hairy beneath smooth above, Lobes toothed
9528 Stem herbaceous hairy, Lvs. bipinnate, Lobes linear smoothish, Pedunc. 1-fl.
9529 Stem herbaceous procumbent smooth, Lvs. subbipinnatifid toothed, Pedunc. many-fl. capitate

§ 10. SEYMOURIA. Sweet. *Petals 2, distinct at base, abruptly reflexed in the middle. Stamens 5, nearly equal, in a long straight tube, all fertile.*

9530 Lvs. roundish cordate bluntish entire ciliated shining on the upper side
9431 Leaves ovate entire acute smooth, Umb. simple, Flowers pentandrous

§ 11. JENKINSONIA. Sweet. *Petals 5, the two upper much larger than the rest, emarginate at end, striated with colored lines, the 3 lower much smaller. Stamens 10, ascending, spreading at end, hairy at base, 7 fertile, of which the three upper are shorter, the three sterile shortened, subulate, of equal length. Stems shrubby. Flowers large.*

9532 Lvs. bipinnatifid hairy, Stem procumb. hairy, Flowers heptandrous, Petals 4
9533 Stem shrubby flexuose, Lvs. pubescent palmate 5-fid, Lobes cuneate 3-toothed at end

§ 12. CHORISMA, Lindl. *Petals 4, rarely 5, the two upper with long claws largest, two lower much smaller. Stamens declinate, in a very long tube, jointed in middle, connate, 7 fertile, of which the two lower are loose; the 3 sterile shortened, subulate of equal length.*

9534 Branches 4-cornered fleshy, Leaves cordate bluntly lobed somewhat toothed

§ 13. PELARGONIUM. Lindl. *Petals 5, unequal, the two upper approximating. Stamens 10, unequal, 7 fertile, 3 sterile, subulate.*

* *Petals whole colored, the two upper shorter and narrower. Stamens short, erect, the two lowest very short with nearly sessile anthers. Stem shrubby, fleshy.* CICONIUM, Sweet.

9535 Leaves very smooth obovate crenate somewhat fleshy, Pedunc. few-fl. Petals linear
9536 Leaves roundish obsoletely lobed crenate smooth zoned, Petals linear breadth of sepals
9537 Leaves roundish obseletely lobed crenate : younger somewhat zoned, Pedunc. 4-fl. Petals linear
9538 Leaves roundish obsoletely lobed crenate downy zoned, Petals linear narrower than sepals
9539 Leaves roundish obsoletely lobed crenate smooth not spotted, Petals linear cuneiform
9540 Leaves cordate-orbicular obsoletely lobed toothed zoned upwards, Pedunc. many-fl. Petals cuneate

9541 Leaves reniform 5-lobed crenate zoned, Stipules cordate obl. acute ciliated, Umbels many-fl. crowded
9542 Leaves round reniform scarcely divided crenate viscid, Petals obovate cuneate
9543 Leaves cordate orbicular cut-lobed toothed pubescent on each side, Petals obl. cuneate
9544 Leaves roundish reniform obsoletely lobed somewhat zoned complicate crisp downy on each side

** *Petals nearly equal in size.*

§ A. *Stems herbaceous. Leaves cordate, palmate, lobed. Petals small.*

9545 Stem diffuse, Lvs. cord. ov. obsoletely lobed bluntly toothed ciliated, Pet. equal to the cal. and one another

and Miscellaneous Particulars.

attention at all periods. If well managed, they flower beautifully, and are incomparably superior in all points to the commoner races. They are no where in this country managed with so much success as by Sweet, who seems to hold the reins of nature in his hands in a more steady manner than any cultivator of the age.

History, Use, Propagation, Culture,

The most common free-growing kinds will thrive well in any rich light soil, or a mixture of loam and decayed leaves will suit them very well: the dwarfer woody kinds, as P. tricolor, elegans, Blattarium, ovale,

9546 Stem diffuse, Lvs. cord. somewhat lobed bluntly crenate villous beneath, Pet. larger than calyx

9547 Stem fleshy very short, Branches herbaceous long diffuse, Lvs. roundish cordate very soft
9548 Branches spreading soft with down, Lvs. roundish cordate about 3-lobed bluntly toothed very soft
9549 Stems square very smooth, Lvs. cordate roundish cut toothed, Pedunc. about 2-fl.
9550 Stems 3-cornered 2-edged smooth, Lvs. cordate roundish obsoletely lobed toothed, Umb. many-fl.
9551 Stem hispid, Lvs. reniform 3-5-lobed blunt toothed at end smoothish, Pedunc. long 2-4-fl.
9552 Stem villous, Lvs. cordate 5-lobed palmate villous, Pedunc. few-fl. Stigma sessile
9553 Stem erect, Lvs. bipinnatifid laciniate smooth, Involucres and calyxes blunt

§ B. *Stem half shrubby. Leaves pinnate. Lobes multifid.*

9554 Leaves cinereous velvety palmately 3-cut, Lobes linear trifid, Calyxes somewhat hispid
9555 Leaves 3-cut dark-green, Lobes distant 3-parted laciniated, Petals linear flaccid
9556 Stem fleshy naked erect, Leaves hairy bipinnate decompound, Lobes linear subulate
9557 Leaves 3-parted fleshy cut-toothed glaucous, Segments subsessile cuneiform, Honey spur very long
9558 Leaves cuneiform trifid toothed, Petioles and stipules persistent spiny, Umb. comp. few-fl.

§ C. *Stem half-shrubby, fleshy. Leaves trifid or pinnate, fleshy, Petals yellowish brown.*

9559 Stem with tumid articulations, Leaves pinnate of 1 or 2 pairs with an odd one blunt cuneate cut-toothed

§ D. *Nearly stemless. Root fascicled, tuberous. Leaves decompound, laciniated. Petals yellowish brown.*

9560 Leaves decompound laciniate hairy, Segm. linear, Umb. many-fl.
9561 Leaves hairy pinnate, Segm. bipinnate; divisions ovate toothed somewhat acute
9562 Leaves smooth ciliated fleshy 5-7-lobed toothed reflexed at end, Umb. many-flow. Fls. on very long stalks
9563 Leaves hairy pinnate, Segm. bipinnatifid; divisions linear acute
9564 Leaves ternate oblong blunt wavy hairy on each side and revolute at end, Petals 2-parted multifid
9565 Leaves cordate downy beneath bluntly 3-5-lobed sinuate-toothed, Scape divided
9566 Leaves decompound smooth, Leaflets cut, Segments channelled linear, Calyx reflexed

§ E. *Stem short, or somewhat fleshy. Leaves divided, cut or toothed. Petals scarlet or crimson.*

9567 Leaves hairy pinnated, Segments laciniate pinnatifid decurrent, Lobes linear lanceolate
9568 Leaves 3-parted, Segm. sessile cuneate cut toothed, Middle lobe larger pinnatifid
9569 Leaves cord. 3-lobed, Segm. toothed: lateral bifid; middle 3-lobed, Stipules cord. acum. somew. toothed

§ F. *Stem half shrubby. Leaves lobed, hairy. Petals with a broad purple spot in the middle.*

9570 Leaves hispid 3-parted, Segm. multifid, Lobes linear-lanceolate serrated
9571 Leaves cordate 3-fid wavy hairy blunt toothed: lateral segments 3-lobed; upper 5-lobed

§ G. *Stem fleshy, half shrubby. Leaves oblong, or oftener cordate, somewhat cut. Stipules lanceolate, spreading, acute. Roots tuberous, fascicled.*

9572 Leaves 3-parted hairy, Lateral segments smaller lobed toothed; term. long cut-toothed, Pet. spreading
9573 Leaves oblong lobed pinnatifid, Petioles united at base, Umb. many-flowered
9574 Leaves cord. obl. subruncinate toothed downy, Scape branched, Umb. many-fl. Involucre leafy
9575 Leaves ovate cordate somewhat lobed crenate villous beneath, Stipules persistent spiny
9576 Leaves reniform obacuminate toothed silky on each side, Bractes 4 times shorter than pedicel
9577 Leaves reniform obacuminate toothed silky on each side, Bractes twice as short as pedicels
9578 Leaves cordate cut-lobed wavy bluntly toothed downy, Honey-tube 4 times as long as calyx
9579 Leaves reniform crenate-toothed downy beneath, Stipules persistent dilated at base

§ H. *Stem shrubby, fleshy. Leaves peltate, or cordate 5-lobed, fleshy. Honey-tube as long as stalk. Stipules broad ovate.*

9580 Branches fleshy round, Leaves cordate 5-lobed somewhat toothed fleshy smooth, Umb. many-fl.
9581 Branches fleshy angular, Leaves peltate 5-lobed entire fleshy, Umb. few-fl.

**** Two upper petals broader, shorter, very blunt.*

9582 Stem weak prostrate, Branches petioles and peduncles softly hairy, Leaves oval acute toothed hoary
9583 Leaves elliptical roundish finely serrate blunt rigid smooth, Petals all obovate

***** Two upper petals longer and broader. Stems shrubby.*

§ A. *Leaves smooth, or nearly smooth, more or less glaucous.*

1. *Petals white, the upper generally lined with red, or spotted.*

9584 Very smooth and glaucous, Leaves lanceolate entire acuminate, Peduncles 1-2-fl.
9585 Smooth glaucous, Leaves lanceolate entire or 3-parted; lower toothed, Pedunc. about 1-fl. panicled
9586 Very smooth somewhat glaucous, Leaves ovate acute glaucous somewhat cut remotely serrate
9587 Very smooth, Leaves deeply 3-parted, Segm. acinaciform cut serrate, Peduncles 3-flowered
9588 Very smooth glaucous, Leaves 3-parted, Segm. trifid cuneate; divisions linear lanc. Pedunc. about 2-fl.
9689 Smooth glauc. Lvs. 5-lobed palmati. cord. at base, Lobes toothed tow. the end, Pet. 3 times as long as cal.
9590 Smooth glaucous, Leaves 3-5-lobed palmate-parted, Segments trifid toothed, Stipules ovate cordate acute

2. *Petals rosy or violet, upper generally striped with purple.*

9591 Smooth glaucous, Leaves long-stalked cordate reniform 3-5-fid toothed, Petals lanceolate-cuneate
9592 Smooth glaucous, Leaves on long stalks cordate roundish 5-fid toothed zoned above
9593 Smooth glaucous, Leaves cord. 5-lobed toothed glaucous beneath: younger zoned above; upper 5-parted

and Miscellaneous Particulars.

&c. thrive best in an equal mixture of sandy loam and peat, and require their pots to be well drained: the succulent kinds like a light sandy loam, and require scarcely any water when not in vigorous growth: the

History, Use, Propagation, Culture,

tuberous rooted kinds thrive best in very sandy loam and peat, and require no water after they have flowered, till they begin to grow afresh. Cuttings of the shrubby kinds strike root freely under hand-glasses in the same

§ B. *Flowers white, or scarcely rose-colored; two upper petals deep-red, lined. Leaves ovate, cordate, or reniform toothed, undivided.*

9594 Lvs. ovate cut serr.: the younger scabrous backwards; adult nearly smooth, Stipules ovate acuminate
9595 Leaves ovate unequally serrate smoothish, Stipules ovate-lanceolate, Peduncles 2-4-flowered
9596 Umb. many-fl. Leaves ovate acute concave rigid somew. lobed uneq. tooth. truncate at base many-nerved

§ C. *Petals white, narrow. Leaves cordate, soft with down. Stipules spreading much.*

9597 Stem shrubby fleshy, Branches peduncles and leaves hirsute, Leaves cordate hastate 5-lobed very soft
9598 Stem shrubby fleshy, Branches and pedunc. subhispid, Lvs. cord. hastate 5-lobed rough, Umb. many-fl.

§ D. *Leaves cordate, flat, toothed. Lower petals linear; upper purple, lined.*

9599 Branches leaves and pedunc. hairy, Leaves cordate roundish angular toothed, Umbels panicled many-fl.
9600 Lvs. cord. acute toothed flat hoary beneath and downy, Branches and ped. pilose, Lower pet. subulate-lin.
9601 Leaves cordate acutely crenulate quite smooth, Stipules linear reflexed, Umbels many-flowered
9602 Leaves roundish ovate truncate subcordate at base cut-toothed wavy beneath hoary pubescent

§ E. *Leaves cordate, or cuncate, toothed, undivided, or lobed. Lobes blunt, not divided down to the middle. Flowers purple. Lower petals oblong or obovate.*

1. *Leaves undivided, cucullate.*

9603 Leaves reniform cucullate toothed pubescent, Branches and peduncles softly hispid, Lower petals oblong
9604 Leaves roundish truncate reniform with acute cartilaginous teeth many-nerved subpubescent
9605 Leaves roundish ovate subcord. concave somewhat angular serr. pubesc. Honey-tube the length of calyx
9606 Leaves cun. at base entire at end palmately 5-lobed toothed many-nerved rather villous, Stip. cordate ovate
9607 Leaves truncate at base subcucul. roundish bluntly 5-lobed toothed pubesc. Stipules cord. ovate acuminate
9608 Leaves reniform blunt cucullate toothletted hairy on each side, Umbels many-flowered
9609 Leaves cord. roundish somewhat lobed tooth-crenate wavy at edge, Stipules cord. acute somew. toothed

2. *Leaves lobed, flattish.*

9610 Leaves cordate bluntly 3-lobed wavy villous soft, Pedunc. about 2-flowered
9611 Leaves truncate at base subcuneate 3-fid flat hairy, Lobes divaricating serrated at end, Lower petals lin.
9612 Leaves cordate 3-lobed roughish blunt toothed, Stipules broad cordate, Stem erect
9613 Leaves cordate lobed wavy softly villous toothed, Stipules broad cordate, Stems diffuse
9614 Lvs. subcord. acute slightly 5-lobed serrated, Umb. 5-fl. subcapitate, Ped. scarcely longer than involucrum

3. *Leaves lobed. Lobes acutely cut at end.*

9615 Lvs. deeply 3-lobed, Lobes round. blunt unequally toothlett. Veins ben. and cal. roughish, Stipules cord.
9616 Leaves cuneate at base trifid, Lobes acute: middle longer subserrate with a midrib muricated beneath
9617 Leaves cuneate at base trifid rough, Lobes lanc. loosely serrated, Pedun. 1-4-flowered
9618 Leaves cuneiform distichous rough plaited truncate at end cut-toothed, Peduncles 2-flowered short
9619 Leaves distichous roundish fleshy subcuneate at base trifid wavy plaited rough toothed, Pedun. about 2-fl.
9620 Leaves truncate cord. 3-lobed toothed hoary, Stipules scarcely any, Peduncles 3-4-flowered
9621 Lower lvs. deeply 3-lobed beneath pustular, Lateral lobes spreading unequally and acutely toothed
9622 Leaves deeply 3-lobed, Lobes spreading unequally and acutely toothed at end beneath and at edge rough
9623 Leaves 3-parted cucullate rough, Lobes cuneiform cut-serrate at end: the middle one trifid

§ F. *Leaves divided beyond the middle. Lobes toothed, cut, or pinnatifid. Flowers purplish or pale.*

9624 Leaves cord. pinnatifid with rounded recesses, Lobes blunt crenate, Branches and petioles hispid
9625 Leaves palmately 7-lobed, Lobes oblong blunt toothed revolute at edge, Umb. many-fl capitate
9626 Leaves cord. hastate 5-angled toothed viscid smoothish, Umb. 2-4-fl. Honey tube a little longer than calyx
9627 Leaves palmatifid downy hispid, Lobes acuminate cut toothed, Umb. panicled many-fl.
9628 Leaves palmated rough, Lobes narrow pinnatifid revolute at edge, Segm. linear, Umb. few-fl.
9629 Leaves palmated roughish cuneate at base, Lobes lanc. remotely toothed, Umb. few-fl.
9630 Leaves somewhat palmated rough, Lobes 5-7-oblong blunt crisply toothletted at edge, Umb. 5-fl. in heads
9631 Leaves palmated viscid smooth, Lobes linear pinnatifid repand toothed flattish, Umb. few-fl.
9632 Leaves rough palmate 5-lobed, Lobes oblong serrated: middle 3-lobed, Umbels few-fl. compound

‡ *Uncertain species.*

9633 Stem fleshy branched arboreous, Lvs. cord. peltate pubesc. variably glauc. Petioles villous without stipules
9634 Leaves reniform distichous slightly 3-lobed blunt unequally toothed wavy
9635 Leaves slightly trifid unequally and acutely toothed wavy hairy, Peduncles 2-4-fl.
9636 Leaves roundish ovate blunt subtrifid folded together wavy toothed hairy beneath, Sepals erect
9637 Leaves slightly 3-lobed flat blunt, Lobes divaricating unequally and finely toothed, Pedunc. 3-fl.
9638 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Branches petioles and peduncles villous
9639 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Honey tube twice as short as reflexed calyx
9640 Leaves ellipt. blunt: floral obsoletely subtrifid unequally toothed somew. cuneate and entire at the base
9641 Leaves flat very smooth half round 7-lobed serrated slightly cordate at base, Pedunc. 2-5-flowered

and Miscellaneous Particulars.

kind of soil, or in pots, without being covered by glass, and placed in a shady situation. Many of the kinds may also be increased by pieces of their roots, or from seeds. The tuberous-rooted kinds may be propagated

DECANDRIA.

9643 Stem erect diffuse branched, Peduncles longer than petiole, Leaves 5-parted, Lobes oblong cut-toothed
9644 Stem erect diffuse branched, Ped. longer than petiole, Leaves opp. 5-parted, Lobes trifid, Lobelets linear
9645 Stem diffuse, Leaves hoary beneath 7-part. Lobes multifid linear, Pedunc. elongated, Calyxes silky villous
9646 Stem diffuse, Leaves hoary beneath 5-parted, Lobes obl. cut-toothed, Ped. very long and cal. gland. hairy
9647 Stem very short, Radical leaves on long stalks silky on each side 5-7-parted, Lobes 3-fid, Lobelets linear
9648 Stem very short, Rad. leaves stalked glaucous pubescent 5-parted, Lobes cuneiform trifid, Pedunc. radical
9649 Stem shrubby, Leaves smooth palmate 5-cut, Segments bipinnatifid, Peduncles opposite erect hairy
9650 Stem suffruticose at base dichot. at end, Lvs. smooth 5-parted, Lobes toothed at end, Cal. globose inflat.
9651 Root subglobose, Stem naked from base to the branches, Leaves 5-parted, Lobes lin. pinnately cut serrate
9652 Stem villous dichotomous, Leaves 5-7-parted, Lobes pinnately cut, Calyxes ciliate villous
9653 Stem 4-cornered, Lower leaves 5-lobed; upper 3-lobed, Lobes oblong acuminate serrate, Pet. emarginate
9654 Stem angular, Rad. leaves 7-lobed; cauline 5-lobed, Lobes oblong acuminate toothed, Petals emarginate
9655 Stem erect somewhat angular, Leaves opposite 5-lobed, Lobes cuneate ovate lobed-toothed, Stip. connate
9656 Stem round, Leaves 5-lobed, Lobes oval acuminate cut-toothed, Stipules connate bifid
9657 Stem round, Lower leaves 5-lobed; upper 3-lobed, Lobes ovate acute cut toothed, Stipules distinct
9658 Stem round, Leaves altern. 5-7-lobed cut-toothed; upper sessile, Petals reflexed tootned at end
9659 Stem round, Leaves 5-lobed cut-toothed; upper sessile, Petals spreading entire, Filaments hairy at base
9660 Like the last, but with dark fuscous petals
9661 Like Phæum, but the petals are rose-colored and emarginate
9662 Stem round simple, Lvs. 5-lobed, Lobes ovate coarsely toothed: lower on long stalks altern.; upp. sess. opp.
9663 Stem round erect smooth, Lvs. about 7-lobed, Lobes obl. cut serr. Ped. corymbose, Pet. somew. emarginate
9664 Stem round erect downy, Lvs. about 7-lobed, Lobes linear obl. cut serrate, Ped. somew. corymb. Pet. entire
9665 Stem round erect smooth, Leaves palmate subpeltate 5-7-lobed, Lobes oblong coarsely cut, Ped. very long

and Miscellaneous Particulars.

sand, under a bell-glass, plunged in heat. The cuttings must not be put in very close together, and the glass must be wiped frequently, as they are apt to damp off." (*Bot. Cult.* 129.)

History, Use, Propagation, Culture,

interest, and in others, being extremely shewy border-flowers. The G. Lancastriense is the most elegant, and G. sanguineum the most ornamental of our British kinds. G. anemonifolium, a Cape species, is singularly beautiful, on account of its fine caulescent stem, loaded with large fern-like glossy leaves of the most delicate green, and its fine red rich blossoms broader than half a crown.

1464. *Brownea.* Named after Dr Patrick Browne, an English physician, who published a Natural History of Jamaica, in 1756, illustrated with figures from the pencil of Ehret. A splendid genus, as yet rare in British gardens. Loamy soil best suits rooted plants; and ripened cuttings root in sand in close moist heat.

1465. *Monsonia.* In memory of Lady Ann Monson, a lady of eminent botanical acquirements, who resided for many years in the East Indies, and is said to have assisted in compiling Lee's Introduction to Botany. The species are curious and beautiful plants: they grow well in turfy loam and rotten leaves, and are increased by cuttings of the shoots or roots.

9666 Stem somew. angul. erect dichotomous pubesc. backw. Lvs. 3-5-part. cut-toothed : radic. on very long stalks
9667 Stem angular diffuse pubesc. backw. Lvs. palmate 5-part. : lobes 3-lobed cut serrate, Ped. and cal. vill. viscid
9668 Stem decumbent villous with spreading hairs, Leaves 5-7-lobed : lobes cut-toothed, Ped. very long hairy
9669 Stem ascending smoothish, Leaves peltate 7-parted : lobes cut, Peduncles and calyx villous
9670 Stem naked at base erect smooth, Caul. lvs. opposite 3-5-part. : lobes cut acute, Ped. 3 times as long as leaf
9671 Stems decumbent branched, Petioles and peduncles hispid, Leaves 3-5-parted : lobes linear blunt trifid
9672 Stems decumbent, Petioles pedunc. and calyx smoothish, Caul. lvs. opp. 3-5-parted : lobes trifid toothed
9673 Stem prostrate compressed, Lvs. opp. 5-lobed : lobes oblong unequally toothed, Ped. elong. and cal. hairy
9674 Stem erect branched, Leaves reniform 7-lobed : segm. oblong obtuse trifid ; lobes 3-toothed
9675 Stem more flaccid and nearly naked, Grains nearly smooth. Otherwise like the last
9676 Leaves ren. : rad. 9-lobed ; caul. 7-lobed : lobes 3-fid, Pet. bifid length of pointless cal. Fruit smooth rugose
9677 Leaves subreniform 7-lobed : lobes 3-fid, Petals emarg. length of pointless cal. Fruit downy not rugose
9678 Radic. lvs. reniform 7-lobed ; caul. roundish trunc. at base 5-lobed : lobes trifid, Pet. length of awned cal.
9679 Leaves 5-parted : lobes multifid linear, Petals emarginate length of awned calyx, Fruit smooth
9680 Leaves 5-parted : lobes trifid linear, Petals emarginate length of awned calyx, Fruit hairy
9681 Lvs. 5-lob. beyond middle : lobes cut 3-5-fid, Ped. clustered at end, Petals emargin. length of awned calyx
9682 Lvs. 5-lobed : lobes cuneate ovate cut-tooth. Hair of stem spread. hispid, Pet emarg. length of awned calyx
9683 Lvs. 5-lob. : upp. 3-lob. : lobes obl. coarsely and irreg. tooth. Hair of stem spread. hisp. Pet. shorter than cal.
9684 Very smooth, Leaves rounded 5-lobed, Calyx pyramidal angular transversely wrinked, Fruit muricate
9685 Leaves 3-5-parted : lobes trifid pinnatifid, Petals entire twice as long as the angular awned calyx
9686 Like the last, but the petals only a little longer than calyx
9687 Stem prostrate nodose, Leaves opposite deeply 5-lobed

9688 Stamens length of cor. Pedunc. aggregate, Branches smooth

DODECANDRIA.

9689 Leaves palmate 5-parted, Segm. finely bipinnatifid, Petioles and calyxes smooth
9690 Leaves palmate 5-parted, Segm. 3-parted pinnatifid ; beneath calyxes and petioles hairy
9691 Leaves cordate 5-7-fid : lobes blunt serrated ; beneath petioles and calyxes somewhat hairy
9692 Leaves ovate oblong subcordate crenate wavy, Stipules rigid, Pedunc. 1-fl. with 2 bractes
9693 Leaves ovate mucronate entire, some subsessile, some on long stalks

9694 Decandrous, Leaves cordate finely serrate downy beneath, Peduncles 2-flowered, Calyxes sub-bilabiate
9695 Decandrous, Leaves cordate crenate velvety with down on each side, Flowers subterminal few corymbose
9696 Decandrous, Leaves cordate ovate tooth-serrate acuminate rough, Flowers axillary
9697 Leaves cordate acuminate serrate downy green, Peduncles axillary few-flowered, Fruit-stalk very long
9698 Leaves cordate lanceolate crenulate downy beneath rusty, Fl. terminal subracemose

9699 Young leaves downy, adult smoothish cordate 7-nerved crenate, Corymb bifid
9700 Leaves downy beneath smooth above ovate oblong 7-nerved subcordate-peltate toothed

9701 Leaves hastate lanceolate serrate
9702 Leaves ovate serrated

9703 Leaves roundish cordate acuminate very large, Stipules large persistent ovate wavy

9704 Leaves oblong acuminate coarsely somewhat toothed at end, Pedicels scarcely longer than petiole
9705 Leaves cordate blunt toothed
9706 Leaves oblong acuminate entire cordate at base sagittate on one side

and Miscellaneous Particulars.

1466. *Helicteres.* Derived from ἑλιξ, a screw, in allusion to the manner in which the fruit is twisted. Free-flowering plants of easy culture, and increased in sand closely covered. They have little or no merit.

1467. *Dombeya.* Named after Joseph Dombey, a famous French botanist, who travelled in Peru with Ruiz and Pavon, in 1777. Ripened cuttings root in sand in moist heat.

1468. *Pentapetes.* One of the names given by the Greeks to the Cinquefoil ; but having no reference to the present genus, except that the calyx and capsules are in five. The species are of easy culture in any rich light soil, and are readily increased by cuttings in sand.

1469. *Astrapæa.* So called from αστραπη, lightning, in allusion to the splendid colors of the flowers. A noble genus, remarkable for the large heads of flowers, and the great dilated stipules at the base of the leaves.

1470. *Pterospermum.* From πτερον, a wing, and σπερμα, a seed. Light soil suits the plants, and cuttings with their leaves on root in sand covered close.

History, Use, Propagation, Culture,

1471. *Malope.* A name given by the Greeks to the Tree Mallow.

1472. *Malva.* Altered by the Latins from the Greek word, μαλαχη, soft, in allusion to the soft mucilaginous qualities of the species. Some of the species are shewy plants, and M. capensis is valued in small greenhouses as flowering all the year. M. sylvestris, *Mauve*, Fr., has still a place in the Materia Medica, on account of its

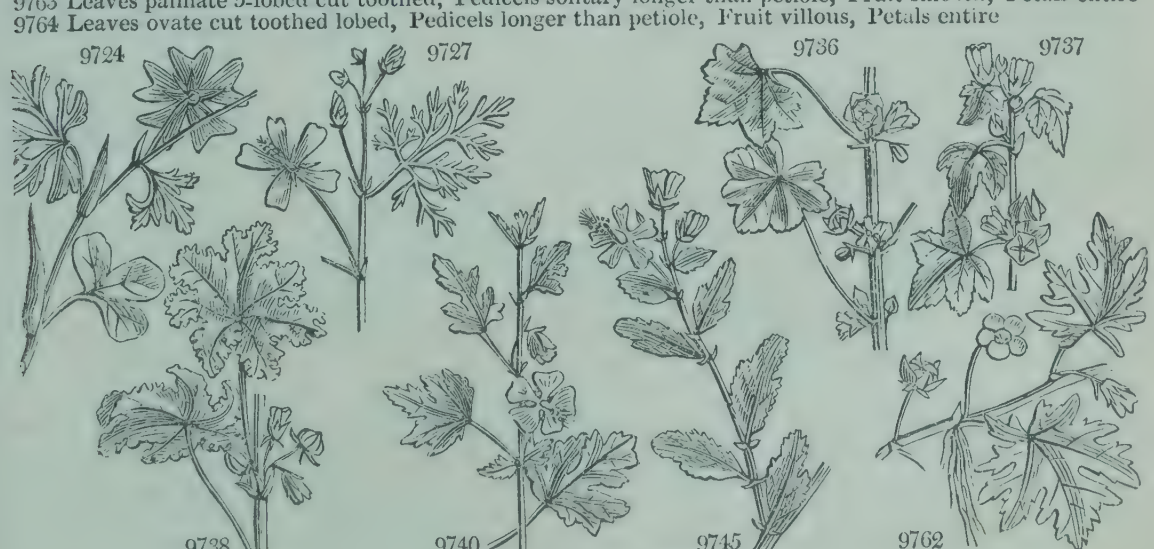
POLYANDRIA.

9707 Leaves ovate crenate, Stipules oblong-linear
9708 Leaves 3-nerved trifid toothed smooth : lobes acuminate

9709 Leaves oblong or ovate acute serrate, Flowers axillary clustered
9710 Leaves ovate acute crenate serrate hairy, Fl. axillary subsolitary
9711 Leaves ovate-lanceolate doubly toothed obsoletely 3-lobed beneath rough, Peduncles axillary 2-flowered
9712 Leaves ovate crenate-serrate beneath velvety, Fl. axillary clustered
9713 Leaves ovate acute coarsely toothed pubescent; upper cuneate at base, Fl. axillary and terminal spiked
9714 Leaves ovate acuminate serrate rough, Fl. axillary and terminal spiked
9715 Leaves ovate or subcordate rough above downy beneath, Flowers in ovate spikes
9716 Leaves cordate crenate blunt and branches downy, Flowers lateral heaped
9717 Leaves subcordate acute toothed downy beneath, Fl. sessile, Lobes of calyx ovate
9718 Leaves cordate acuminate serrated rough ; lower lobed, Pedunc. axillary, Flowers in heads
9719 Leaves cordate blunt smooth, Flowers sessile heaped
9720 Dwarfs, Leaves ovate toothed : adult smoothish ; younger hairy, Fl. axillary solitary on short stalks
9721 Leaves reniform broadly crenate and branches leprous, Stems prostrate
9722 Leaves cordate roundish 5-angled crenate villous, Pedicels longer than petiole
9723 Leaves half orbicular crenate ; upper rhomboid, Stem erect hairy
9724 Lower leaves 3-lobed entire ; upper multifid, Segm. trifid toothed at end
9725 Leaves 3-parted, Segm. trifid ciliated toothed at end, Cor. less than calyx
9726 Leaves 3-parted, Segm. trifid linear blunt, Cor. 3 times as large as calyx
9727 Leaves many-parted : lobes trifid linear, Stem decumbent, Hairs stellated
9728 Lower leaves angular ; upper 5-parted cut, Stems and calyxes velvety
9729 Lower leaves reniform cut ; cauline many-parted, Segments linear, Stems and calyxes hairy

9730 Leaves palmated : lobes lanceolate toothed, Hairs simple, Pedicels longer than leaf
9731 Stem erect, Leaves 5-lobed blunt, Pedicels and petioles smoothish or downy on the upper side
9732 Stem erect, Leaves 5-7-lobed acute, Pedicels and petioles hairy
9733 Stem prostrate, Leaves cord. orbic. bluntly 5-lobed, Pedicels in fruit drooping and petioles downy

9734 Stem diffuse, Lvs. cord. orbicular 7-lobed soft : lobes acute, Fls. aggreg. stalked, Leaves of involucre bristly
9735 Stem erect, Leaves cordate roundish about 5-lobed crenate smooth, Fl. axillary sessile clustered
9736 Stem spreading, Leaves roundish bluntly angular crenate smoothish, Fl. axillary sessile clustered
9737 Stem erect, Leaves cordate roundish bluntly angular, Fls. axill. clustered sess. Cal. rough somew. inflated
9738 Stem erect, Leaves angular toothed crisp smooth, Flowers axillary sessile
9739 Pedicels 1-flowered aggregate shorter than leaf, Involucre ovate acuminate, Leaves 5-lobed hairy rugose
9740 Pedicels 1-flowered solitary or twin longer than petiole, Involucre linear, Leaves cut crenate smooth rigid
9741 Pedicels 1-fl. solitary or twin longer than petiole, Inv. ov. lanc. Lvs. 5-lobed or 3-lobed cren. toothed glutin.
9742 Pedicels 1-fl. solitary longer than petiole, Involucre obl. linear, Lvs. sub-three-lobed acute unequally toothed
9743 Pedicels 1-flowered solitary length of leaves, Leaves subsessile cuneiform trifid entire
9744 Pedicels solitary longer than petiole, Leaves lobate plaited toothed roughish, Branches divaricating
9745 Pedicels solitary longer than petiole, Involucre lanceolate, Leaves oblong very blunt 3-lobed toothed
9746 Pedicels solitary 1-fl. twice as long as petiole, Involucre ovate acute very large, Leaves cordate crenate hairy
9747 Pedicels solitary 1-fl. length of petiole, Involucre lanc. Leaves cordate 5-lobed toothed, Branches glutinous
9748 Pedicels solitary 1-fl. length of petiole, Involucre nearly linear, Leaves ovate about 3-lobed toothed hairy
9749 Pedicels solitary 1 or 2-fl. shorter than petiole, Leaves cordate about 5-lobed blunt rough with stellat. hair
9750 Pedicels solitary 1-3-fl. length of petiole, Involucre obl. linear, Leaves sinuate lobed serrate rugose hairy
9751 Pedicels 1-2-fl. solitary longer than petiole, Involucre linear, Leaves 5-lobed blunt rugose very rough
9752 Leaves angular acute cordate villous, Petals obcordate shorter than calyx, Pedunc. panicled
9753 Leaves ovate 3-lobed toothed downy, Pedunc. axillary racemose few-flowered
9754 Leaves angular 5-lobed ; middle lobe largest, Pedunc. axillary racemose, Flowers 1-sided
9755 Leaves palmate, Spikes axillary 1-sided, Fruit toothletted
9756 Leaves 7-lobed rugose, Spikes axillary 1-sided, Fruit smooth
9757 Leaves 5-lobed : lobes pinnatifid sinuate toothed, Pedunc. corymbose capitate, Fruit with two beaks
9758 Leaves subpeltate 5-lobed blunt, Pedunc. axillary umbelled, Involucre obovate stipitate deciduous
9759 Leaves 5 angular downy, Pedunc. axillary bifid few-flowered, Involucre oblong small
9760 Leaves 3-parted hoary, Segm. toothed at end ; middle trifid, Pedunc. axillary 1-flowered
9761 Leaves lanceolate toothed downy, Pedunc. axillary 2 few-fl. Involucre setaceous deciduous
9762 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit villous
9763 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit smooth, Petals entire
9764 Leaves ovate cut toothed lobed, Pedicels longer than petiole, Fruit villous, Petals entire



and Miscellaneous Particulars.

demulcent properties; but it is greatly inferior to Althæa, and therefore little used. Malva was an excellent vegetable among the Romans, but what species is uncertain A tree of the mallow kind is said, by Prosper Alpinus, to afford food to the Egyptians; and the Chinese use some sort of mallow as food.

All the species are of the easiest culture and propagation.

History, Use, Propagation, Culture,

1473. *Kitaibelia.* Named after Dr. Paul Kitaibel, professor of botany at Pest, in Hungary, and author, in conjunction with Count Waldstein, of a noble work upon the plants of that country. A tall mallow-like plant with vine-like leaves, and white flowers.

1474. *Althæa.* From αλθω, to cure. The salutary effects of the mucilaginous root, are well known in medicine. *Guimauve*, Fr. A. officinalis has long been in repute as a demulcent. Its roots are sometimes used as an emollient suppurative cataplasm; and a decoction of the leaves forms a useful fomentation in external abrasions, and in cutaneous eruptions, accompanied with a sharp ichorous discharge.

A. rosea is the parent of nearly twenty splendid varieties of border flowers, which seed readily, and the offspring generally resembles the parent variety. All the species are of the easiest culture in common garden soil.

1475. *Lavatera.* In memory of two Lavaters, physicians of Zurich, neither the physiognomist, but two friends of Tournefort. The species resemble those of Malva, in general appearance and culture: much the handsomest is L. arborea, which is a magnificent plant in shrubberies, or in the back of wide borders.

9765 Leaves 5-lobed acute toothed

9766 Leaves soft on each side cordate or ovate toothed undivided or 3-lobed, Pedunc. axillary many-fl.
9767 Leaves pubescent: lower 5-7-parted; upper trifid, Peduncles many-fl. longer than leaf
9768 Leaves downy hoary beneath: lower palmate; upper 3-parted: lobes narrow coarsely toothed
9769 Leaves cordate rough with hairs smooth above: lower blunt; upper 5-lobed, Stem hispid
9770 Leaves smooth cordate roundish lobed toothed, Pedicels axillary clustered 1-flowered
9771 Leaves roundish cordate 5-angled crenate, Pedicels 1-fl. much shorter than petiole
9772 Stem upright hairy, Leaves cordate 5-7-angled crenate rugose, Flowers axillary sessile
9773 Stem erect hispid, Leaves roundish cordate, Invol. as long as calyx
9774 Stem upright smoothish, Leaves rounded lobed crenulate serrate, Flowers solitary subsessile
9775 Stem subflexuose hispid, Leaves cordate about 7-lobed blunt on long stalks, Flowers axillary solitary
9776 Stem erect hairy, Leaves palmate 7-lobed beyond the middle: lobes oblong blunt irregularly toothed

9777 Leaves 7-angled downy plicate, Pedicels axillary 1-fl. clustered much shorter than petiole
9778 Leaves 7-angled acute crenate plaited downy, Racemes terminal
9779 Leaves soft hoary 5-lobed; upper 3-lobed: middle lobe elongated; upper oblong undivided
9780 Leaves downy on each side acutely 5-lobed; upper 3-lobed, Flowers solitary on short stalks
9781 Stem hispid, Leaves hoary 5-lobed; upper 3-lobed or undivided, Flowers subsessile
9782 Stem and leaves downy subcordate sub-three-lobed round crenate, Pedicels aggregate, Calyxes acuminate
9783 Leaves 7-angular downy plaited, Racemes terminal
9784 Stem rough, Leaves 5-lobed downy beneath, Pedunc. axillary aggregate, Petals emarginate
9785 Stem and leaves downy roundish bluntly angular crenate, Pedicels axillary solitary
9786 Leaves somewhat downy: lower angular; upper 3-lobed: middle lobe longer than the rest
9787 Stem herbaceous hispid, Leaves 5-lobed acute, Pedicels axillary 1-flowered aggregate
9788 Stem rough, Leaves somewhat downy: lower round cordate; upper 3-lobed, Pedicels solitary 1-fl.
9789 Stem herbaceous, Leaves smoothish roundish cordate; upper angular, Pedicels solitary

9790 Leaves cordate roundish bluntly angular toothletted, Invol stalked 3-leaved 7-flowered, Stem rough
9791 Leaves cordate palmate 5-lobed, Heads stalked 5-leaved 10-flowered, Stem with scattered hairs
9792 Leaves palmate-lobed, Heads stalked 5-leaved many-flowered, Invol. acuminate, Calyxes and stems hairy

9793 Leaves roundish very bluntly 3-lobed velvety on each side 7-nerved 1-glanded, Cal. oblong lanceolate
9794 Lower leaves 3-lobed; upper lanceolate panduriform beneath hoary netted with one gland
9795 Leaves trifid downy pale beneath with 3 glands: lobes angular toothletted blunt
9796 Leaves broad ovate cut lobed with narrow recesses: lobes acute coarsely and unequally toothed

9797 Leaves broadly obovate truncate crenate at end, Pedic. axillary 1-fl. longer than leaf
9798 Leaves ovate acuminate subcordate doubly toothed, Pedicels axillary 1-fl.
9799 Leaves ovate subcordate 3-pointed somewhat toothed and branches covered with viscid hairs
9800 Leaves cordate 3-lobed serrate, Pedicels axillary 1-fl. ascending, Involucre 3-leaved
9801 Leaves 5-angular: lobes toothed acuminate, Pedic. axillary 1-fl. much shorter than petiole
9802 Leaves 7-angular acuminate toothed hairy, Fl. axillary subsessile clustered
9803 Lower leaves roundish cord. crenate others 3-5-lob. Pedicels axillary 1-fl. Inv. 10-leaved setaceous ciliated

9804 Leaves cordate 3-5-lobed acuminate roughish, Leaflets of invol. erect
9805 Leaves cordate about 3-lobed acuminate soft downy, Leafl. of invol. somewhat spreading
9806 Leaves cordate crenate blunt or acuminate, Branches and petioles hairy

9807 Leaves ovate acuminate serrate downy beneath, Invol. and cal. downy
9808 Leaves ovate toothed somewhat 3-lobed hoary with down beneath
9809 Leaves lanceolate oblong entire white with scales beneath

and Miscellaneous Particulars.

1476. *Malachra.* A name under which Pliny speaks of a tree from the north of Persia, producing a certain gum. It had no reference to the plant called Malachra by the moderns. Sow in light rich soil, and transplant as with other stove annuals.

1477. *Urena*, the vernacular name in Malabar. The species are of easy culture, seed freely, or may be propagated by cuttings in sand under a hand-glass.

1478. *Pavonia.* In honor of Don José Pavon, the companion of Dombey, in his voyage to Peru, and one of the authors of Flora Peruviana. The species are free-growers, and seed readily: they are also increased by cuttings in sand under a hand-glass.

1479. *Achania.* From $\alpha\chi\alpha\nu\eta\varsigma$, closed; so called because the corolla does not open out as in most Malvaceous plants, but remains always rolled together.

1480. *Hibiscus.* One of the Greek names of the mallow. The species are for the most part shewy plants, and not difficult of culture. All of them abound in mucilage, like many of the same natural family, and the

History, Use, Propagation, Culture,

bark of the ligneous sorts may be manufactured into mats or cordage. Of H. tiliaceus, in the island of Otaheite, they make matting of the bark, as fine as our coarse cloth; also ropes and lines, from the size of an inch to that of a small packthread; and fishing nets. (*Hawks. Voy.* ii. 217.) Forster informs us, they also suck this bark for food, when the bread-fruit fails them: and in New Caledonia, the inhabitants frequently subsist on it, though it is an insipid food, affording very little nourishment.

H. Rosa-sinensis is extremely common in the gardens of China, and the East Indies; but its native country is unknown. Loureiro, however, affirms, that it is spontaneous as well as cultivated both in China and Cochin-China; and that it is so common in the latter, that they have entire hedges of it to their gardens. It has been long known from its appearance on Chinese screens and paper hangings. The variety with double flowers is most frequently cultivated, both in the East and in European hothouses: the plant is, indeed, rarely seen with single flowers. (*Smith, spicil.*)

H. syriacus is one of our most beautiful hardy shrubs, the more valuable as it is a free-flowerer, will grow in common garden soil, and propagates freely by seeds, layers, and even by cuttings.

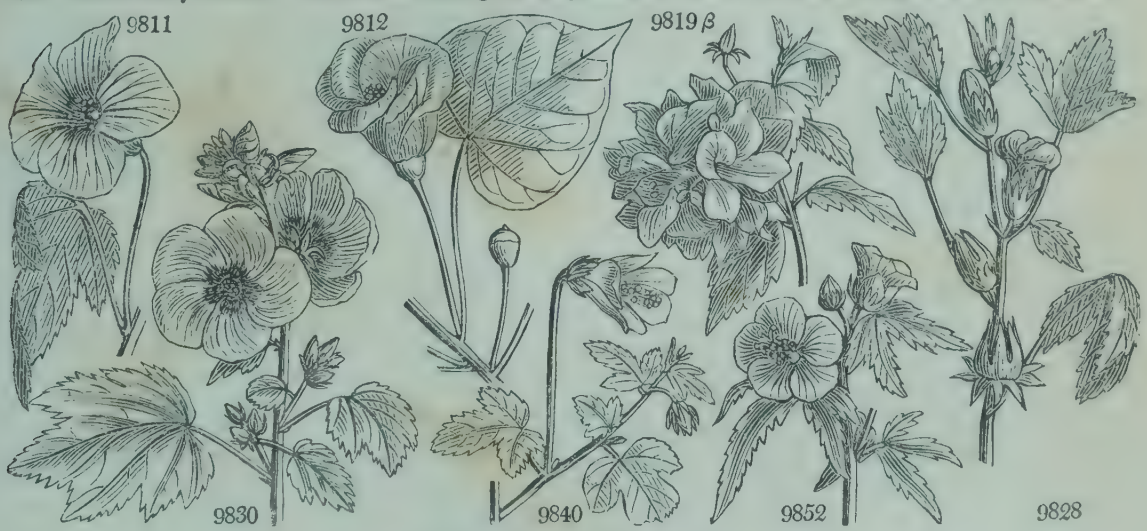
H. Sabdariffa (the Turkish name) in the West Indies is called Red Sorrel. The calyxes and capsules, freed

9810 Leaves ovate acuminate bluntly serrate hoary on each side, Pedicels axillary 1-fl.
9811 Leaves 3-lobed hastate acuminate serrate smooth on each side, Pedicels jointed in the middle
9812 Leaves roundish cordate acuminate (*Thespesia* Dec.)
9813 Leaves roundish cordate acuminate crenate hoary beneath, Invol. 10-toothed
9814 Leaves roundish cordate entire hoary beneath, Pedunc. very short 1-flowered
9815 Leaves cordate 3-pointed smooth dotted beneath, Pedicels solitary 1-fl. longer than petiole
9816 Leaves cordate acutely serrate, Branches somewhat hairy
9817 Leaves cordate ovate-lanceolate acuminate toothed, Pedicels twice as long as petiole
9818 Leaves roundish cordate acuminate finely toothed hairy beneath, Pedicels thick villous
9819 Leaves ovate acuminate smooth entire at base coarsely toothed at end, Pedicels length of leaf

9820 Leaves ovate acuminate serrate; lower subcordate 3-pointed, Pedicels jointed at end
9821 Leaves ovate or roundish undivided serrated rough, Pedic. longer than leaf, Cor. reflexed
9822 Leaves cuneiform about 5-toothed hairy, Pedicels longer than leaf, Invol. 8-10-leaved hispid
9823 Leaves cordate angular 5-lobed acuminate toothed downy, Pedicels nearly as long as leaf

9824 Leaves cuneiform ovate 3-lobed toothed, Pedic. scarcely longer than petiole, Invol. 6-7-leaved

9825 Leaves cordate 5-lobed hairy: lobes acuminate subrepand, Inv. 6-7-leaved setaceous [undivided
9826 Stem and petiol. prickly, Pedic. short unarmed very hairy, Lvs. 3-5-lobed blunt toothed; upper obl. lanc.
9827 Stem prickly, Leaves palmate 5-lobed; upper 3-lobed: lobes blunt unequally toothed narrowed at base
9828 Leaves toothed: lower ovate undivided; upper 3-lobed cuneate at base, Flowers subsess. Invol. 12-toothed
9829 Leaves palmate 5-parted: lobes lanceolate acuminate subserrate at end, Pedicels jointed under the end
9830 Stem hairy, Leaves on long stalks ovate about 3-lobed serrate membranous smoothish, Pedic. very short
9831 Stem prickly, Leaves linear lanceolate acuminate usually lobed prickly-serrate, Inv. 10-leaved
9832 Stem prickly, Leaves palmate 5-parted with 1 gland beneath, Fl. subsess. Cal. covered with glandul. hairs
9833 Stem rough with recurved prickles, Stipules ½-cord. Leaves palmate 5-lobed, Pedicels length of petiole
9834 Stem rough with recurved prickles, Stipules lanc. Leaves 5-7-parted with lanc. acuminate serrated lobes
9835 Leaves smoothish palmate: lobes 5-7-acuminate coarsely toothed, Inv. hispid 4-6-leaved, Fls. declinate
9836 Stem rough, Leaves rough roundish truncate at base; upper palmate-lobed: lobes dilat. crenate upwards
9837 Stem petioles and calyx muricate, Leaves ovate at base trifid; lower 5-fid: lobes acuminate serrate
9838 Leaves palmated: lobes lanceolate serrate, Petioles muricate, Fl. subsessile solitary, Inv. 7-fid
9839 Leaves subpeltate cordate 7-angular acuminate serrate, Stem hispid, Pedicels longer than petiole
9840 Leaves 3-5-lobed blunt crenate hairy, Pedic. twice as long as leaf, Inv. many-leaved, Cor. campanulate
9841 Leaves cord. 5-lobed blunt toothed, Petioles longer than fl. Inv. 10-leaved decidu. Cal. bursting lengthwise
9842 Stem strigose, Leaves 3-lobed angular cordate toothed downy, Peduncle longer than petiole
9843 Leaves cord. angular sparingly toothed nearly smooth, Branches velvety, Caps. turbinate truncate hispid
9844 Stem prickly, Leaves smoothish coarsely toothed without glands, Leaves of the invol. with a tooth inside
9845 Leaves cordate unequally toothed beneath hoary: lower about 5-lobed; upper acum. Pedic. 1-fl. very short
9846 Stem somew. prickly, Leaves smoothish toothed 5-angular acuminate, Fls. cernuous, Caps. 5-winged hairy
9847 Leaves acuminate unequally toothed subvillous: lower undivided cordate; upper ovate-cordate 3-lobed
9848 Leaves cordate oblong toothed bluntish angular slightly 3-lobed smooth, Pedicels longer than petiole
9849 Lvs. toothed: lower undivided; upper 5-fid: lobes oblong nearly equal blunt, Cal. inflat. membran. nerved
9850 Lvs. toothed: lower undivided; upper 3-parted: lobes lanc. middle one very long, Cal. infl. membr. nerved
9851 Leaves toothed: lower leaves 3-lobed; upper 5-parted blunt, Stem hispid
9852 Leaves hairy 5-lobed: lobes linear oblong coarsely toothed, Cal. very villous longer than involucrum



and Miscellaneous Particulars.

from the seeds, make very agreeable tarts; and a decoction of them, sweetened and fermented, is commonly called sorrel cool drink. It is a small diluting liquor, much used in our sugar colonies, and reckoned very refreshing in those sultry climates. (*Browne's Jam.*) The bark of this species, and also of H. cannabinus, is full of strong fibres, which the inhabitants of the Malabar coast prepare and make into cordage; and it seems as if it might be wrought into fine strong thread of any size.

The leaves of H. surattensis are gratefully acid, and eaten in salads. The mucilage of the root of H. manihot is used in Japan for giving consistence to paper.

H. Abelmoschus, from the Arabic *Ab-el-Mosch*, grain or seed of musk, has large seeds of a very musky odor, and are frequently used as a substitute for animal musk in scenting powders and pomatums. In Arabia and Egypt they are ground and mixed with coffee, to render it more agreeable to the head and stomach.

H. esculentus, the Okro of the West Indies, is cultivated there, and in some parts of France, for the pods, which are gathered green and used in soups, or pickled like capers. They are full of a nutritive mucilage, and buttered and spiced make a very rich dish.

History, Use, Propagation, Culture,

1481. *Gossypium.* Pliny says, that in Upper Egypt, on the borders of Arabia, grew a shrub called *gossypion* or *xylon.* Its fruit enclosed a sort of soft white wool, of which the garments of the Egyptian priests were manufactured. Golius remarks, that *goz,* which expresses in Arabia, a silky substance, may be the root of the word. An important genus, as furnishing the down used in the cotton manufacture. This down is found lining the capsules which contain the seeds. There are several species cultivated for this purpose in different parts of the world. G. herbaceum is the only species cultivated in Europe, especially in the Levant, and in Malta, Sicily, and Naples: it is also grown in many parts of Asia.

G. hirsutum is occasionally grown in the West Indies; but G. barbadense is the prevailing species there. In the East Indies and China, G. herbaceum and arboreum are cultivated, and some other species, especially that which produces the nankeen-colored down, not yet introduced to Europe. An oil is obtained from the seeds of all the species, while those of the G. herbaceum are eaten in the Levant, and esteemed wholesome and nutritive.

In the Levant, the herbaceous cotton is sown in well prepared land in March, in lines at three feet distance, and the patches of seeds two feet apart in the lines. The plants are thinned out to two or three in a place, and the earth is stirred by a one-horse plough, or by manual labor with hoes, and irrigated once or twice a week by directing the water along the furrows between the rows. The flowering season is generally over about the middle of September, and then the ends of the shoots are pinched off to determine the sap to the capsules. The capsules are collected by hand as they ripen, a tedious process, which lasts till the end of November. The cotton and the seeds are then separated by manual labor, and the former packed in bales or bags for sale. The seeds are bruised for oil or eaten, and a portion kept for sowing.

The Barbadoes cotton plant is sown in the West Indies in rows, about five feet asunder, at the end of September, or the beginning of October; at first but slightly covered, but after it is grown up, the root is well moulded. The soil should not be stiff nor shallow, as this plant has a tap-root. The ground is hoed frequently, and kept very clean about the young plants, until they rise to a moderate height. It grows from four to six feet high, and produces two crops annually; the first in eight months from the time of sowing the seed; the second, within four months after the first; and the produce of each plant is reckoned about one pound weight. The branches are pruned or trimmed after the first gathering; and if the growth is over luxuriant,

9843 Leaves 5-lobed 1-glandular beneath : lobes round mucronate, Involucre serrate, Stem smooth
9854 Leaves 5-lobed palmate : lobes lanceolate blunt mucronate with 1 gland beneath, Involucre nearly entire
9855 Lower leaves 5-lobed palmate ; upper 3-lobed with 1 gland beneath, Involucre tern. Calyx with 3 glands at base
9856 Upper leaves undivided cordate ; lower 3-5-lobed with 1 gland beneath, Branches and petioles hirsute
9857 Upper leaves 3-lobed ; lower 5-lobed with 1 gland beneath, Branches and petioles spotted with black
9858 Upper leaves 3-lobed ; lower 5-lobed with 3 glands beneath, Stem smoothish

9859 Leaves ciliated elliptical entire rarely trifid

9860 Smoothish prostrate, Peduncles nearly as long as petiole

9861 Leaves very cæsious, Stem very short

9862 Lower leaves cordate acuminate 5-angled somewhat toothed blunt ; upper hastate acuminate
9863 Leaves all crenate : lower roundish cordate blunt 5-angled ; upper round hastate acuminate
9864 Lower leaves triangular hastate crenate ; upper ovate lanc. nearly entire, Ped. sol. axill. length of leaves

9865 Lower leaves cord. about 5-lobed hastate : upper hastate, Petals erect spatulate somewhat toothed at end

1. *Capsules 5-12, 1-seeded, not bladdery.*

* *Flower-stalks not longer than the leafstalk. Leaves oblong or ovate*

9866 Leaves linear entire much longer than the diameter of the flower, Racemes terminal
9867 Leaves linear-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic. axill. subsolitary
9868 Leaves ovate-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic. axillary solitary
9869 Leaves oblong ovate subcordate blunt tooth, Pedicels as long as petiole
9870 Leaves ovate-lanceolate acuminate toothed smooth, Branches round downy, Rac. very short bracteolate
9871 Leaves ovate-oblong doubly serrate, Pedunc. axillary very short about 4-flowered, Branches flattened
9872 Leaves rhomboid narrowed at base serrate-toothed forwards beneath downy, Pedicels shorter than petiole
9873 Lvs. ellipt. subov. blunt toothed at end, Pedic. axill. solitary very short, Stipules ciliated longer than flow.
9874 Lower lvs. roundish ov. ; upp. obl. toothed cun. and nearly ent. at base, Pedic. axill. many shorter than pet.

** *Flower stalks elongated, distinctly jointed. Leaves oblong or ovate*

9875 Lvs. ovate lanc. acumin. toothed hoary beneath, Branches compr. dotted, Pedic. thrice as long as petiole
9876 Leaves lanceolate toothed smooth, Pedic. axillary 1-fl. length of leaf
9876 Leaves oblong-lanceolate toothed cuneate at base hoary beneath, Pedic. axillary 1fl. shorter than leaf
9878 Leaves somewhat rhomboid retuse crenate towards the end hoary beneath, Pedic. longer than petiole
9879 Leaves ovate blunt serrated downy shining, Pedic. axillary solitary much longer than petiole

*** *Flower-stalks elongated. Leaves cordate at base, toothed, not lobed.*

9880 Leaves ovate cordate blunt toothed, Pedicels solitary 1-flowered longer than petiole

and Miscellaneous Particulars.

this should be done sooner. When great part of the pods are expanded, the wool is picked, and afterwards cleared from the seeds by a machine called a gin, composed of two or three smooth wooden rollers of about one inch diameter, ranged horizontally, close and parallel to each other, in a frame; at each extremity they are toothed or channelled longitudinally, corresponding one with the other; and the central roller being moved with a treaddle or foot-lath, resembling that of a knife-grinder, makes the other two revolve in contrary directions. The cotton is laid in small quantities at a time upon these rollers, whilst they are in motion, and readily passing between them, drops into a sack placed underneath to receive it, leaving the seeds, which are too large to pass with it, behind. The cotton thus separated from the seeds, is afterwards hand-picked and cleansed thoroughly from any little particles of the pods or other substances which may be adhering to it. It is then stowed in large bags, where it is well trod down, that it may be close and compact; and the better to answer this purpose, some water is every now and then sprinkled upon the outside of the bag; the marketable weight of which is usually three hundred pounds. An acre may be expected to produce from two hundred and forty pounds to that quantity; or two hundred and seventy pounds on an average. (*Long's Jam.* vol. iii. p. 686. *&c.* and *Browne.*)

1482. *Redoutea.* Named after P. J. Redouté, a celebrated French botanical draughtsman, still living. His drawings are inferior to those of the Bauers as accurate representations of nature; but they are generally tastefully arranged and please the eye, notwithstanding a coldness of coloring which often injures their effect.

1483. *Palavia.* In honor of Don Antonio Palau y Verdera, second professor of botany at Madrid, and author of an excellent translation of the Species Plantarum of Linnæus in Spanish.

1484. *Cristaria.* From *crista*, a crest, in allusion to the crested form of the capsules. A pretty plant, not very easily preserved. It answers better in a peat border than a pot, and is increased by division or seed.

1485. *Anoda.* Named by Cavanilles, from *α*, privative, and *nodus*, an articulation; because the peduncles do not possess the joints which are found in Sida, from which the plants of this genus have been extracted.

1486. *Periptera.* So named from the resemblance of the flowers in form to a shuttlecock, *περιπτερα.*

1487. *Sida.* A name of Theophrastus, said by some to have been applied to a Malvaceous plant; but

History, Use, Propagation, Culture,

Adanson is of opinion, that our Nymphæa was the Sida of Theophrastus. The species are free-flowerers of no

9881 Leaves roundish cordate hairy above serrated, Pedicels subsolitary longer than petiole
9882 Leaves roundish cordate bluntish crenate softly velvety, Pedic. solitary 1-fl. longer than petiole
9883 Leaves cordate serrate attenuated at end downy on the edge of the petiole and the nerves beneath
9884 Leaves ovate cordate toothed somew. angular bluntish downy, Pedic. sol. 1-fl. a little shorter than petiole
9885 Leaves cord. somewhat angular blunt serrate cren. downy on each side, Pedic. shorter than petiole 1-5-fl
9886 Leaves ovate cordate acuminate toothed, Pedunc. 3-4-flowered very short
9887 Leaves cordate ovate acuminate serrate smooth on each side, Peduncles many-fl.
9888 Leaves ovate cordate toothed acuminate downy, Pedunc. loosely panicled capillary

******** *Leaves palmate, divided into 3-5-7-9 lobes.*

9889 Leaves cordate toothed 3-lobed; middle lobe acute long, Pedicels solitary nearly equal to the leaf
9890 Leaves subpeltate 7-lobed: lobes lanceolate acuminate pinnatifid toothed, Peduncles many-fl.
9891 Leaves subpeltate 5-lobed: lobes ovate acute toothed undivided, Peduncles about 1-flowered
9892 Leaves palmate 5-lobed smooth: lobes oblong acuminate toothed, Peduncles many-fl.
9893 Leaves palmate 7-lobed rough: lobes lanceolate cut-toothed, Pedunc. many-fl. bracteate corymbose

2. *Capsules* 15-40, 1-*seeded, bladdery.*

9894 Leaves oblong cordate toothed somewhat lobed, Pedicels solitary shorter than petiole
9895 Lvs. cord. ovate acute toothed downy on each side, Petioles and pedicels hairy, Stip. setaceous spreading
9896 Lvs. cord. roundish acumin. tooth. velvety, Petioles and branches with spreading hairs, Pedic. very short

3. *Capsules* 5-10, *many-seeded, often bladdery.*

***** *Capsules* 5-8.

9897 Leaves cord. lanc. acuminate entire downy beneath, Pedicels divided slender longer than petiole
β Leaves narrow rough above
γ Leaves more cordate smooth and a little rugose above
9898 Leaves subpeltate cordate ovate acuminate entire downy, Pedic. 1-fl. shorter than petiole
9899 Leaves roundish cordate acuminate entire downy beneath, Panicle terminal racemose
9900 Leaves cordate shortly acuminate subcrenate slightly downy and green on each side, Panicle leafless
9901 Lvs. deeply cord. with a narr. base acumin. serrul. hairy above hoary beneath, Stips. broad-eared acumin.
9902 Leaves cordate acuminate serrulate velvety on each side, Pedicels solitary 1-flowered
9903 Leaves hoary cordate acuminate acutely crenate, Pedicels 1-fl. longer than petiole
9904 Leaves roundish cordate toothed angular acuminate, Pedicels 4-fl. umbelled axillary

****** *Capsules* 9 *or more.*

9905 Leaves roundish cordate acuminate crenate downy, Pedicels sol. longer than petiole
9906 Leaves cordate acuminate crenate velvety; upper sessile, Pedicels sol. longer than petiole
9907 Leaves round cordate acuminate crenate downy, Pedicels longer than petiole
9908 Leaves roundish cordate acuminate toothed downy beneath, Pedicels longer than petiole
9609 Leaves roundish cordate unequally toothed soft, Pedunc. 2-3-fl. shorter than petiole, Capsules acuminate
9910 Leaves roundish cordate with a broad sinus acuminate toothed soft, Pedicels shorter than petiole
9911 Leaves cordate oblong undivided downy, Pedicels shorter than leaf
9912 Leaves roundish cordate acuminate toothed downy, Peduncles shorter than petiole
9913 Leaves cordate ovate oblong toothed velvety on each side, Pedicels longer than petiole
9914 Leaves roundish cordate acuminate toothed downy, Peduncles longer than leaves
9915 Leaves roundish cordate acuminate unequally repand toothed downy, Peduncles longer than petiole
9916 Leaves roundish cordate acuminate toothed velvety, Peduncles 2-flowered shorter than petiole
9917 Leaves ovate orbicular reniform toothed hoary beneath, Pedicels longer than petiole
9918 Leaves cordate somewhat lobed soft, Stipules reflexed, Pedicels erect 3 times as long as petiole
9919 Leaves ovate cordate toothed tricuspidate, Pedicels twice as long as petiole
9920 Leaves roundish cordate acuminate toothed hoary on each side, Pedicels length of petiole
9921 Leaves cordate subpeltate 3-5-lobed unequally toothed villous, Pedicels 1-flowered longer than petiole

4. *Uncertain species.*

***** *Leaves linear, oblong, ovate, or lanceolate.*

9922 Leaves linear lanceolate toothed villous beneath, Pedicels axillary 1-fl.
9923 Leaves lanceolate very long entire hairy, Racemes terminal very short
9924 Leaves broad lanceolate obtuse crenate entire at base 3-nerved; younger downy beneath
9925 Middle leaves oblong blunt acutely crenate in front; upper lanceolate acute serrated in front
9926 Leaves oblong lanceolate serrated entire at base smooth, Pedunc. axillary solitary longer than petiole
9927 Leaves ovate acuminate 5-nerved scarcely toothletted; beneath and branches downy, Stipules filiform

****** *Leaves cordate, undivided.*

9928 Leaves subcordate sessile serrate subvillous, Flowers axillary clustered
9929 Stem warted, Leaves cordate lanceolate acuminate acutely crenate downy
9930 Leaves cordate acuminate crenate toothletted, and stems green and downy, Pedic. axillary 1-fl.
9931 Leaves cordate acuminate cut serrate, Peduncles solitary longer than petiole
9932 Leaves cordate acuminate repand rarely crenate hoary, Panicle contracted bracteate
9933 Leaves cordate acute crenate rugose and stems yellow with down, Flowers subsessile aggregate
9934 Leaves cordate acuminate hoary beneath, Pedicels axillary 1-flowered longer than petiole

and Miscellaneous Particulars.

great beauty. They are increased by seeds, which they produce freely, or by cuttings in sand under a hand-glass.

History, Use, Propagation, Culture,

1488. *Lagunea.* Named after Andreas Laguna, a Spanish naturalist, who published, in 1543, a work upon plants. It may be treated like other tender annuals.

1489. *Ruizia.* In honor of Don Hippolito Ruiz, author of Quinologia, Madrid, 1792, and other works, and, in conjunction with Pavon, of the famous Flora Peruviana. A plant of easy culture, but of little merit.

1490. *Carolinea.* Named by the younger Linnæus, in honor of the Princess Sophia Caroline, of Baden; a name which, he says, will always be cherished by botanists. A splendid family, which thrive in loam; and large cuttings, well clothed with leaves, root in sand under a hand-glass.

1491. *Adansonia.* In honor of Michel Adanson, a famous French botanist, born in 1727, and author of various works, of which his voyage into Senegal, and Familles des Plantes, are the most remarkable. He was an eccentric man, but certainly far more learned for his time than many of his modern detractors. Monkies'-bread, or Boabab, is considered the largest or rather broadest tree in the world. Several measured by Adanson were from sixty-five to seventy-eight feet in circumference, but not extraordinarily high. The trunks were from twelve to fifteen feet high, before they divided into many horizontal branches, which touched the ground at their extremities; these were from forty-five to fifty-five feet long, and were so large, that each branch was equal to a monstrous tree; and where the water of a neighbouring river had washed away the earth, so as to leave the roots of one of these trees bare and open to the sight, they measured one hundred and ten feet long, without including those parts of the roots which remained covered. It yields a fruit which resembles a gourd, and which serves for vessels of various uses; the bark furnishes a coarse thread, which they form into ropes, and into a cloth, with which the natives cover their middle from the girdle to the knees; the small leaves supply them with food in a time of scarcity, while the large ones are used for covering their houses, or, by burning, for the manufacture of good soap. At Sierra Leone this tree does not grow larger than an orchard apple-tree.

The ligneous part of this tree appears to be of little or no use as timber. In our stoves it grows in rich soil in heat, and cuttings root in sand, covered and plunged.

1492. *Bombax.* From βομβυξ, one of the Greek names of the cotton; the seeds of the plants now so called are enveloped in a cottony substance. B. pentandrum bears oval fruit larger than a swan's egg, having a thick woody cover, which, when ripe, opens in five parts, and is full of a short dark cotton, inclosing many roundish seeds as large as small peas.

B. Ceiba has a spiny trunk, and is one of the tallest trees of both Indies; but the wood is very light, and not much valued, except for canoes. Their trunks are so large as, when hollowed, to make very large ones. In the West Indies they frequently carry from fifteen to twenty hogsheads of sugar, and from six to twelve hundred weight each. When sawn into boards, and then well saturated with lime-water, the wood bears exposure to the weather many years; it is also formed into laths for roofs, curing-pots, and hogshead-heading. When the tree decays, it becomes a nest for the Macaca beetle, the caterpillar of which, gutted and fried, is esteemed by many persons one of the greatest delicacies. The down which is enclosed in the seed-vessels is seldom used, except by the poorer inhabitants to stuff pillows or chairs; and it is generally thought unwholesome to lie upon.

9935 Leaves cordate 3-lobed: lobes oval oblong acuminate toothed with a very narrow base

9936 Leaves of the flowering branches palmatifid; of the sterile palmate

9937 Leaves digitate, Filaments numerous forked united at base into a tube
9938 Leaflets 5-8 ovate-lanceolate acuminate
9939 Leaflets 7 elliptical-oblong acute at each end, Calyx truncate, Petals erect
9940 Leaflets 5-7 obovate oblong, Calyx sinuated, Petals erect spreading at end

9941 A tree with a very thick trunk with a diameter of 25 feet

9942 Anthers rectilinear, Leaflets 7, Corolla large woolly outside, Trunk prickly
9943 Anthers anfractuose, Leaflets entire, Trunk generally prickly
9944 Stem prickly, Leaves palmate, Leaflets 5, Fruit turbinate concave at end
9945 Stem prickly, Leaves palmate, Leaflets 7 entire acuminate, Fruit oblong blunt

9946 Leaves ovate-oblong, Calyxes turbinate, Column of stamens shorter than petals

9947 Pedicels axillary half as short as leaves, Leaves oblong coriaceous smooth serrated
9948 Fls. subsessile, Leaves obov. lanc. downy beneath subserrate membranous, Petals and sepals silky outside

9949 Flowers large white, Filaments purple, Anthers blue
9950 Leaves ovate acute, Flowers solitary subsessile

9951 Leaves elliptical oblong subrugose twice as broad as long
9952 Leaves lanceolate flat three times as broad as long

and Miscellaneous Particulars.

1493. *Myrodia.* From μυρον, myrrh, and οσμη, smell. A tree which emits an odor similar to myrrh. (*Linn.*)

1494. *Gordonia.* In memory of James Gordon, an eminent nurseryman at Mile-End, near London, a correspondent of Linnæus and other eminent botanists, and the introducer and successful cultivator of many new plants. G. Lasianthus (woolly flower, from λασιος and ανθος), the loblolly-bay, is said to grow naturally in water or very moist situations. Miller, on that account, was unsuccessful in keeping the plant. Gordon and Lee, who, as Ellis relates, (*Corres. with Linnæus*) were better cultivators than Miller, were probably more successful. Sweet says, the species are hardy enough to bear our winters in the open air; but the young shoots often get injured, and the summer is not long enough to flower them in perfection; it is therefore better to treat them as greenhouse plants. Peat soil suits them best, and a little loam mixed with it: they are readily propagated by layers, or ripened cuttings may be struck in sand under a hand-glass. (*Bot Cult.* 199.)

1495. *Stuartia.* So named by Linnæus, in honor of the Marquis of Bute, in memory of whom there also exists another genus named Butea, by Roxburgh. The species are handsome shrubs, grow in peat soil, and are most readily increased by layers.

1496. *Camellia.* In honor of George Joseph Kamel, (or Camellus) a Jesuit. His Syllabus Stirpium in Insula Luzone Philippinarum, forms the appendix to the third volume of Ray's History. This is a remarkable genus, as at once furnishing the domestic drug tea, in universal use, and flowering trees and shrubs as universally admired. The seeds of all the species are crushed for oil, which is used like that of hemp or poppy in cookery.

C. Bohea and viridis are the species which chiefly furnish the tea; but C. Sasanqua is also used, and sometimes the leaves of the other species are taken, though that practice is rather to be considered in the light of adulteration. The tea districts of China extend from the twenty-seventh to the thirty-first degree of north latitude. According to the missionaries, it thrives in the more northern provinces; and from Kæmpfer, it appears to be cultivated in Japan as far north as latitute 45°. It seems, according to Dr. Abel's observation, to succeed best on the sides of mountains, where there can be but little accumulation of vegetable mould. The soils from which he collected the best specimens consisted chiefly of sandstone, schistus, or granite. The plants are raised from seeds sown where they are to remain. Three or more are dropped into a hole four or five inches deep; these come up without further trouble, and require little culture, except that of removing weeds, till the plants are three years old. The more careful stir the soil, and some manure it; but the latter practice is seldom adopted. The third year the leaves are gathered, at three successive gatherings, in February, April and June, and so on till the bushes become stinted or tardy in their growth, which generally happens in from six to ten years. They are then cut in to encourage the production of fresh roots.

The gathering of the leaves is performed with care and selection. The leaves are plucked off one by one: at the first gathering only the unexpanded and tender are taken; at the second those that are full grown; and at the third the coarsest. The first forms what is called in Europe imperial tea; but as to the other

History, Use, Propagation, Culture,

names by which tea is known, the Chinese know nothing; and the compounds and names are supposed to be made and given by the merchants at Canton, who, from the great number of varieties brought to them, have an ample opportunity of doing so. Formerly it was thought that green tea was gathered exclusively from C. viridis; but that is now doubtful: though it is certain there is what is called the green tea district, and the black tea district; and the varieties grown in the one district differ from those grown in the other. Dr. Abel was told by competent persons, that either of the two plants will afford the black or green tea of the shops, but that the broad thin-leaved plant (C. viridis) is preferred for making the green tea.

The tea leaves being gathered, are cured in houses which contain from five to ten or twenty small furnaces, about three feet high, each having at the top a large flat iron pan. There is also a long low table covered with mats, on which the leaves are laid, and rolled by workmen, who sit round it: the iron pan being heated to a certain degree by a little fire made in the furnace underneath, a few pounds of the fresh-gathered leaves are put upon the pan; the fresh and juicy leaves crack when they touch the pan, and it is the business of the operator to shift them as quick as possible with his bare hands, till they become too hot to be easily endured. At this instant he takes off the leaves with a kind of shovel resembling a fan, and pours them on the mats before the rollers, who, taking small quantities at a time, roll them in the palm of their hands in one direction, while others are fanning them, that they may cool the more speedily, and retain their curl the longer. This process is repeated two or three times, or oftener, before the tea is put into the stores, in order that all the moisture of the leaves may be thoroughly dissipated, and their curl more completely preserved. On every repetition the pan is less heated, and the operation performed more closely and cautiously. The tea is then separated into the different kinds, and deposited in the store for domestic use or exportation.

The different sorts of black and green arise not merely from soil, situation, or the age of the leaf; but after winnowing the tea, the leaves are taken up in succession as they fall; those nearest the machine being the heaviest, are the gunpowder tea; the light dust the worst, being chiefly used by the lower classes. That which is brought down to Canton then undergoes a second roasting, winnowing, packing, &c., and many hundred women are employed for these purposes.

As more select sorts of tea, the blossoms of the C. sasanqua appear to be collected; the buds also appear to be gathered in some cases. By far the strongest tea which Dr. Abel tasted in China, was that called *yutien*, used on occasions of ceremony. It scarcely colored the water, and on examination was found to consist of buds and half expanded leaves of the plant.

As substitutes for tea used by the Chinese, may be mentioned a species of moss common to the mountains of Shan-tung, an infusion of ferns of different sorts, and Dr. Abel thinks the leaves of the common camellia and oil camellia may be added. Du Halde observes, that all the plants called tea by the Chinese, are not to be considered as the true tea plant; and Kæmpfer asserts, that in Japan a species of Camellia, as well as the Olea fragrans, is used to give it a high flavor.

The oil-bearing Camellia, C. oleifera, is cultivated for its seeds, from which an oil is expressed, in very general use in the domestic economy of China. It grows best in a red sandy soil, attaining the height of six or eight feet, and producing a profusion of white blossoms and seeds. These seeds, as well as those of any of the other species, are reduced to a coarse powder, which is stewed or boiled in bags, and then pressed, when the oil is yielded. (*Dr. Abel's Nar.* 176.)

The culture of the tea Camellias in our greenhouses is very simple. The plants are very hardy, and may be preserved in a pit without fire-heat; they grow in loamy soil, or loam and peat well drained, and increase freely by layers, or cuttings of the young wood taken off when it begins to ripen, planted in sand, and covered with a hand-glass in a cool frame or pit.

C. japonica, in the groves and gardens of Japan, is a lofty tree, much admired for its fine form, rich clothing of shining deep green foliage, and elegant red or white flowers, single or double. It is equally admired in

9953 Leaves ovate-oblong bluntly serrated, Flowers terminal subsolitary, Petals obcordate

9954 Leaves ovate acuminate acutely serrate, Flowers terminal subsolitary

and Miscellaneous Particulars

China as in Japan, and much cultivated in both countries. It is of frequent occurrence in Chinese paintings, with Hibiscus and Chrysanthemum, two of their great favorites. There are several varieties of C. japonica in China, most of which have been imported here, and their number considerably increased, and daily increasing, from seedlings raised in this country. The double white, double striped, and double Waratah, (from the central petals resembling those of the Waratah plant of New Holland, Telopea speciosissima,) are considered the grandest and most marked varieties, and are also free-growers and flowerers; the pæony-flowered and fringed white, are also standard beauties; but all are much admired.

The single red Camellia is propagated by cuttings, layers, and seeds, for stocks; and on these the other sorts are generally inarched, and sometimes budded or grafted. The cuttings are formed of ripened or ripening shoots, taken off in August, cut smoothly across at a joint or bud, two or three of the lower leaves only taken off, and the cuttings then planted and made firm with a small dibber, in pans of sand or loam, or, by some cultivators, sand and peat, or sand alone. The pans are kept in a pit or cold frame, without being covered with glass, but shaded during powerful sunshine; and in the following spring such as are struck will begin to push, when they are to be placed in a gentle heat. In September or October following, the rooted plants will be fit to pot off; and in the second or third spring they may be used as stocks. Such is the practice in the London nurseries. Henderson, of Woodhall, near Edinburgh, puts in Camellia cuttings at any time of the year, excepting when they are making young wood. He puts fifty cuttings in a pot of sand eight inches in diameter, sets them in a cool place in the back of a vinery or peach-house for a month or six weeks, and then plunges them to the brim in a hot-bed where is a little bottom heat. A speedy mode of obtaining stocks is by planting stools in a pit devoted to that purpose, and laying them in autumn; the following autumn most of the layers will have produced roots, when they may be taken off and potted, and used as stocks in the succeeding spring. Inarching or grafting is performed early in spring, when the plants begin to grow; the chief care requisite is so to place and fix the pot containing the stock, as that it may not be disturbed during the connection of the scion with the parent plant. The graft being clayed over, is then covered with moss to prevent its cracking. When independent grafting is resorted to, the mode called side grafting is often used; but the operation of tongueing is generally omitted, as weakening the stock and unnecessary, with a view to prevent the scion from being blown off. A few seeds are sometimes obtained from the single red and semi-double Camellias, and from the single Waratah; these require two years to come up, but make the best stocks of any.

Before they are grafted they are often allowed to come into flower, in case some new variety should be produced; but the best cultivators, as Messrs. Loddiges, Sweet, and Mackay, regularly cross-impregnate the blossoms in Knight's manner, by cutting out the stamens before the anthers are mature, and when the stigma is in a proper state, dusting it with the pollen of the species or variety intended as the male parent.

C. Sasanqua seeds most readily, and is mostly employed as the female parent for raising new varieties. The plants, if well treated, flower in four or five years, and if nothing new is produced they still make excellent stocks.

Some cultivators grow the Camellias chiefly in peat. Messrs. Loddiges, who have the most numerous collection of this genus, formerly used loam, with a little sand and peat; and they are grown in a similar soil in Hammersmith nursery. Of late, Messrs. Loddiges find light loam alone to answer as well or better. In the Comte de Vandes garden at Bayswater, rotten dung is mixed with loam and peat. Sweet recommends sandy loam and peat. Henderson of Woodhall is one of the most successful growers of the Camellia in Scotland: his compost is as follows: take one part of light-brown mould, one part of river-sand, one part of peat-earth, one half part rotten leaves; mix them all well together, and when the Camellias require shifting, put some broken coal-char in the bottom of the pots, and some dry moss or hypnum over it. (*Calcd. Mem.* iii. 316.)

Camellias have the best effect, and are grown to most advantage in a house entirely devoted to them. Such

History, Use, Propagation, Culture,

a house should be rather lofty, as the plants never look so well as when six or eight feet high, trained in a conic form, and clothed with branches from the root upwards. The plants should be raised near to the glass by means of a stage, which should be so contrived, that, as they advance in height, it may be lowered in proportion: only the very best crown or patent glass should be used; because it is found from experience, that the least inequality of surface or thickness of material, so operates on the sun's rays, as to concentrate them, and burn or produce blotches on the leaves of the plants. Every cultivator must have observed that leathery shining leaves, like those of the orange, myrtle, &c. are more or less subject to this solar injury; but the leaves of the Camellia are particularly so. Some nurserymen recommend a roof which will not admit much light; others the use of green glass; of an opaque roof, with glass in front only; or of a house facing the north. Our opinion is, that a light house facing the south, or, better still, glass on all sides, is essential to the perfect growth of the plants; and that all solar accidents may be avoided, or at least rendered of no consequence, by using the best glass, and placing the plants as near it as possible.

To grow the Camellia to a high degree of perfection, considerable care is requisite. The roots are very apt to get matted in the pot, and, by the space they occupy, so to compress the ball of mould, as after a time to render it impervious to water. Hence frequent attention should be had, to see that the water poured on the pots moistens all the earth, and does not escape by the sides of the pot, moistening only the web of fibres. When the plants are in flower and in a growing state, they require to be liberally watered, and also a degree of heat somewhat greater than is usually given to greenhouse plants. If this heat is not given in November and December, the plants will not expand their blossoms freely; and if both water and heat are not regularly applied after the blossoming season, vigorous shoots and flower-buds will not be produced. To form handsome plants, they should be trained with single stems to rods, and pruned so as to make them throw out side branches from every part of the stem: to encourage these, the plants should not be set close together on the stage. In summer they may either be set out of doors on a stratum of scoriæ, or on a pavement, in a sheltered but open situation; or the glass roof may be taken off. The hardier sorts, as the double red, blush, pæony-flowered, &c. answer very well when planted in the bed or border of a conservatory, provided the roof or entire superstructure can be removed in summer to admit the full influence of the weather. When this cannot be done, the Camellia and most other plants are better in portable utensils, which admit both of examining their roots, and placing them in the open air, or in a greater degree of heat at pleasure. The single and double red Camellia will endure the open air when trained against a south wall, and protected by mats in winter; and there can be no doubt that in time these and other species will be more perfectly inured to our climate.

Henderson of Woodhall gives the following account of his mode of treating the Camellia. "The best time for a regular shifting of the Camellias is the month of February or beginning of March. After shifting all those that require it, put them into the peach-house or vinery, when there is a little heat; if there be no peach-house, vinery, nor pinery, set them in the warmest part of the greenhouse. They will soon begin to make young wood. From the time they begin to make their young shoots, till they have finished their growth, give them plenty of water They may be kept in the vinery or peach-house till they have formed their flower-buds at the extremity and sides of the young growths, when a few of them may be removed to a colder place, say behind the stage of the greenhouse; for the Camellias are fond of being shaded during

and Miscellaneous Particulars.

strong sunshine. In three or four weeks after, a few more of the Camellias may be brought from the vinery or peach-house, and put into a cooler situation. This may be repeated three or four times, which will make as many different successions of flowering. Those that are wanted to come into flower early, may remain in the warm house till they are beginning to flower, when they should be taken to a cold place, say the coldest place of the greenhouse; then give them plenty of light only, and they will open their flowers well, and stand long. A Camellia cannot stand heat when in flower, indeed they seldom open their flowers fine when in heat, and, at all events, the flowers soon fall off. Those that are kept all the summer in the vinery, will come into flower by the first or middle of October, and a pretty large plant, having perhaps fifty or a hundred flower-buds, will continue in flower till the month of January. Those plants that are removed early from the vinery, will now be in flower, to succeed those that were in flower in October, and have now done flowering. These last should be immediately taken into the heat. They will make their young wood early, and they may remain in heat till they come into flower, which will perhaps be a month earlier next year. By attending to shifting the Camellia plants from the warm-house to the cold, a regular succession of flowers may thus be had from the first of October to the middle of July. I have even had them all the summer, but the flowers are best in the winter. Those produced in summer are far from being so fine, and do not stand half the time of those that come into flower in November, December, January, February, March and April. Camellias delight to be kept damp all the summer months, and a little shaded from the strong sun. Give them plenty of water while they are making their young shoots; they may also get a gentle sprinkling over the leaves once every week during the summer season, except when they are in flower. Camellias will stand a great deal of cold without being much injured, but they will not form many flower-buds without some artificial heat." (*Caled. Mem.* iii. 316.)

1497. *Barringtonia.* In memory of the Hon. Daines Barrington, F. R. S., an active Fellow of the Society of Antiquaries, and author of several papers in their Transactions. A lofty tree, the handsomest in the equinoctial flora. It has thick shady bunches of long wedge-shaped coriaceous leaves, and large handsome purple and white flowers, which open at night, and fall at sunrise. They are succeeded by a reddish brown drupe, the seed of which mixed with the bait, inebriates fish in the same manner as Cocculus indicus. It grows on the sea shore and at the mouths of rivers, and is cultivated in the governor's garden at St. Helena. It is very rare in our stoves, though not difficult to manage. Sweet says, " a mixture of two-thirds loam and one-third peat, is a good soil for it. Cuttings taken off at a joint, when the wood is ripe, and put in a pot of sand under a hand-glass in moist heat, will strike root readily: none of the leaves should be taken off or shortened." (*Bot. Cult.* 21.)

1498. *Gustavia.* In memory of Gustavus III., king of Sweden, who presented a great collection of Indian plants to the elder Linnæus. A tree remarkable for its large white flowers, larger than those of the water-lily, but with a large naked bald receptacle between the corolla and the style. The flowers smell sweet, but the wood is extremely fetid. In Surinam it is used for hoops. In the stove it grows in sand and loam, and roots in sand under a hand-glass.

1499. *Careya.* Named after Dr. William Carey, the editor of Roxburgh's Flora Indica, and an English physician and botanist residing at Serampore. Beautiful Indian plants, with long red stamens.

Class XVII. — DIADELPHIA. Stamens united in two separate parcels.

This class essentially requires, as its name implies, that the stamens should be united in two separate parcels. These may either be equal, each bearing more anthers than one, as in Smithia, Æschynomene, Fumaria, and others; or unequal, one parcel being reduced to a single stamen, and the other bearing several anthers, as in the greater number of genera included in the class. But besides the plants whose stamens are thus disposed, it has been the practice to admit other genera having papilionaceous flowers, but with their stamens united in one parcel only, such as Platylobium, Bossiæa, Arachis, and others. The propriety of this measure is extremely questionable. It has been before remarked in this work, that the value of an artificial arrangement of objects depends wholly upon the precision with which they are referred to those heads or divisions with the characters of which they agree. If this does not obtain, an artificial system ceases to be useful, and its only merit, that of facilitating the discovery of the name of a given object, cannot be said to exist. This principle is particularly applicable to the genera just mentioned. Their artificial character refers them to Monadelphia, but they are retained in Diadelphia, to which their artificial character does *not* refer them, *because*, as is alleged, of the natural relation which they bear to other genera in Diadelphia. If this reasoning, which is only applicable to an arrangement of plants according to their natural affinities, and which has no allowable reference to an artificial system, were to be admitted, it would follow that Tamarindus, actually included in Monadelphia by the most eminent Linnean botanists, and all the papilionaceous genera stationed in Decandria, should be referred hither also. With such objections attaching to the contrivance of this class, it is not easy to understand in what way it "does honor to the comprehensive powers of Linnæus's mind," as has been somewhere remarked by one of his most distinguished panegyrists.

The structure of the corolla of plants of this class is, for the most part, with the exception of Fumaria and its allies, what has been popularly termed papilionaceous; that is to say, it consists of five petals of different forms and direction, of which the *upper*, called the *vexillum* or standard, is larger than the rest, upon which it is incumbent; the *two lateral*, called the *alæ* or wings, are oblong, distinct, and parallel with the ovarium; and the *two lower*, called the *carina* or keel, are enclosed within the alæ, are also parallel with the ovarium, and cohere by their lower edges, so as together to form, as it were, one boat-shaped petal. To this common form of corolla there are, however, some exceptions, as in Amorpha, where the alæ and carina are absent, and in Erythrina, where the alæ are in some cases almost obliterated. In Trifolium the petals all cohere by their claws into an undivided tube.

With regard to the importance of Diadelphous plants as applicable to the purposes of mankind, they may be said to hold the very highest rank. All the numerous varieties of pulse, whether eaten by men or cattle, peas, beans, haricots, caravances, lentils, and others, are all produced by Diadelphous plants. The best of our artificial grasses, such as clover, nonesuch, cow-grass, lucerne, saintfoin, serradilla, &c. &c., belong to various Diadelphous genera. A large proportion of the class also consists of useful and ornamental trees and herbs, which will be noticed in their respective places.

Order 1. PENTANDRIA. Stamens 5.

1500. *Monnieria.* Cal. 5-parted, with the upper segment long. Cor. ringent. Stamens 2: upper with two anthers; lower with three. Caps. 5, 1-seeded.

1501. *Petalostemum.* Petals 4, between the stamens, all united into a slit tube. Vexillum none, but in its place a fifth petal. Legume surrounded by calyx, 1-seeded.

Order 2. HEXANDRIA. Stamens 6.

1502. *Corydalis.* Pet. 4, 1-spurred at base. Pod 2-valved, compressed, many-seeded.

1503. *Cysticapnos.* Petals 4, one gibbous at base. Capsule bladdery, many-seeded; the placentas connected by a membranous net work.

1504. *Diclytra.* Petals 4, two outer equally spurred or gibbous at base. Pod 2-valved, many-seeded.

1505. *Adlumia.* Petals 4, united in a fungous monopetalous corolla, persistent, and with two protuberances at base. Pod 2-valved, many-seeded.

1506. *Sarcocapnos.* Petals 4, 1-spurred at base. Caps. 2-valved, not opening, 2-seeded. Valves 3-nerved, flattish.

1507. *Fumaria.* One petal gibbous or spurred at base. Cariopsis indehiscent, 1-seeded, not pointed with a style.

Order 3. OCTANDRIA. Stamens 8.

1508. *Polygala.* Cal. of 5 leaves, two of them wing-shaped and colored. Caps. compressed, obcordate.

1509. *Muraltia.* Sepals 5, glumaceous, nearly equal. Petals 3, united, the middle bifid with blunt lobes. Ovary with 4 horns or tubercles, 2-valved, 2-celled.

1510. *Mundia.* Sepals 5, glumaceous, persistent, the two inner wing-shaped. Petals 3, scarcely united at base; the middle one cucullate, beardless. Stamens 7-8, somewhat villous, monadelphous at base, with a tube divided in front.

1511. *Securidaca.* Sepals 5, the two inner petaloid. Petals 5, united at base: three united into a 3-lobed keel; two oblong. Stamens 8, diadelphous.

Order 4. DECANDRIA. Stamens 10.

1512. *Nissolia.* Cal. 5-toothed. Legume 1-seeded, ending in a ligulate wing.

1513. *Dalbergia.* Cal. obsoletely 5-toothed. Legume leafy, flat, not opening. Seeds solitary or twin.

1514. *Pongamia.* Cal. colored, cyathiform, obliquely truncate, 5-toothed. Petals clawed. Vexillum spreading. Alæ and carina conniving. Legume substipitate, compressed, flat, rostrate, valveless, 1-2-seeded. Anthers ciliate, glandular at end.

1515. *Pterocarpus.* Cal. 5-toothed. Legume falcate, foliaceous, varicose, indehiscent, encompassed by a wing. Seeds a few, solitary.

1516. *Ecastaphyllum.* Cal. campanulate, sub-bilabiate: upper segment emarginate; lower trifid. Filaments equally diadelphous. Legume roundish, valveless, 1-seeded.

1517. *Geoffroya.* Cal. 5-fid. Drupe ovate. Kernel compressed.
1518. *Dipterix.* Segm. of cal. 2, wing-shaped. Legume 1-celled, 1-seeded, coriaceous, 2-valved.
1519. *Parivoa.* Cal. 3-4-fid. Vexillum ample. Alæ and carina O. Legume compressed, 1-seeded.
1520. *Amerimnum.* Cal. sub-bilabiate. Legume compressed, leafy, 2-valved, dehiscent. Some seeds, solitary.
1521. *Erythrina.* Cal. bilabiate, ǂ. Vexillum very long, lanceolate. Legume torulose.
1522 *Butea.* Cal. sub-bilabiate. Vexillum very long, lanceolate. Legume compressed, membranous, one-seeded at end.
1523. *Viborgia.* Cal. 5-toothed, with rounded recesses. Legume turgid, sulcate, winged.
1524. *Piscidia.* Stigma acute. Legume with four wings.
1525. *Platylobium.* Cal. bracteate, 2-lipped, upper lip round, large, bifid. Stam. all united. Legume stalked, compressed, winged at back, many-seeded.
1526. *Borbonia.* Stigma emarginate. Calyx acuminate, spiny. Legume mucronate.
1527. *Rafnia.* Cal. ringent: upper lip bifid; lower spreading trifid; the middle tooth narrowest. Legume lanceolate, compressed.
1528. *Aspalathus.* Cal. 5-fid, upper segment largest. Legume ovate, blunt, about 2-seeded.
1529. *Sarcophyllum.* Cal. campanulate, 5-parted, regular. Legume acinaciform, acute.
1530. *Crotalaria.* Legume turgid, inflated, stalked. Filaments united with a dorsal fissure.
1531. *Bossiæa.* Cal. 2-lipped, upper lip largest, half bifid, obtuse. Stam. all united. Legume plano-compressed, stalked, many-seeded, thickened at each edge. Seeds strophiolate.
1532. *Scottia.* Cal. imbricated with bractes, 5-toothed, with nearly equal teeth. Vexillum complicate, shorter than alæ, which are as long as carina. Stam. all united. Legume stalked, compressed, thickened at each edge. Seeds 3-4, strophiolate.
1533. *Templetonia.* Cal. ebracteate, with 5 nearly equal teeth. Carina oblong. Stamens all united, with uniform anthers. Legume pedicellate, plano-compressed, many-seeded. Seeds strophiolate.
1534. *Goodia.* Cal. with 2 nearly equal lips, upper half bifid, acute. Vexillum unfurled, large. Stamens all united. Legume stalked, compressed, about 2-seeded. Seeds strophiolate.
1535. *Loddigesia.* Vexillum much shorter than alæ or carina.
1536. *Hovea.* Cal. bilabiate, the upper lip half bifid, retuse. Stamens all united. Carina blunt. Legume sessile, roundish, ventricose, 2-seeded. Seeds strophiolate.
1537. *Spartium.* Stigma longitudinal, villous above. Filaments adhering to ovary. Cal. lengthened at the base.
1538. *Genista.* Cal. 2-lipped: upper one with 2; lower one with 3 teeth. Vexillum bent backwards from the rest of the flower.
1539. *Lebeckia.* Cal. 5-parted, with acute segments and rounded recesses. Legume cylindrical, many-seeded.
1540. *Ulex.* Cal. of 2 leaves, with a small scale at the base on each side. Legume turgid, scarcely longer than the calyx.
1541. *Ononis.* Cal. 5-cleft, its divisions linear. Vexillum striated. Legume turgid, sessile. Filaments in one undivided set.
1542. *Anthyllis.* Cal. inflated, 5-toothed, inclosing the small roundish 1-3-seeded legume.
1543. *Arachis.* Cal. 2-lipped. Cor. resupinate. Filaments united. Legume gibbous, torulose, veiny, coriaceous.
1544. *Lupinus.* Cal. 2-lipped. Anthers, 5 oblong, 5 round. Legume coriaceous, torulose, compressed.
1545. *Amorpha.* Cal. campanulate, 5-fid. Vexillum ovate, concave. Alæ O. Carina O. Legume 2-seeded, falcate.
1546. *Abrus.* Cal. obsoletely 4-lobed, the upper broader. Filaments 9, united at base, opening at back. Stigma blunt. Seed spherical.
1547. *Phaseolus.* Carina with the stamens and style twisted spirally.
1548. *Teramnus.* Carina very small, inclosed in the calyx. Five alternate stamens fertile. Stigma sessile, capitate.
1549. *Carpopogon.* Vexillum not callous. Flowers capitate. Pods short, broad, 1-seeded.
1550. *Dolichos.* Vexillum with two calli at base, parallel, oblong, compressing the wings beneath.
1551. *Stizolobium.* Cal. campanulate, 2-lipped: upper lip entire, erect; lower trifid, with the middle segment longest. Vexillum ascending. Alæ dolabriform, lunate at base, the length of carina. Anthers 2-formed, hairy. Legume torose, 1-celled, with partitions. Seeds round, with a crested hilum.
1552. *Glycine.* Cal. 2-lipped. Carina pushing back the vexillum with its end.
1553. *Kennedia.* Cal. 2-lipped: upper emarginate; lower trifid, equal. Vexillum reflexed, recurved. Alæ pressed to the carina. Carina remote. Stigma blunt. Legume oblong.
1554. *Cylista.* Cal. 4-fid, larger than cor.: upper segment bifid at end, or emarginate; lower very large. Cor. persistent. Legume about 2-seeded.
1555. *Galactia.* Cal. 4-toothed, with 2 bractes. Petals all oblong; the vexillum broadest and incumbent upon the others. Stigma obtuse. Legume round. Seeds roundish.
1556. *Clitoria.* Cor. resupinate, with a large spreading vexillum overshadowing the wings.
1557. *Orobus.* Style linear, cylindrical, downy above. Cal. obtuse at the base, its upper segments deeper and shorter.
1558. *Lathyrus.* Style plane, downy above, broader upwards. Cal. with its two upper segments shortest.
1559. *Ochrus.* Cal. with the two upper segments conniving. Vexillum with two teeth at the sides. Style flat, villous above. Legume having a membranous wing upon the seed-bearing suture.
1560. *Pisum.* Style triangular, keeled above, downy. Two upper segments of calyx shorter than the rest.
1561. *Vicia.* Style bearded beneath the stigma.
1562. *Ervum.* Stigma capitate, hairy all over on the outside.
1563. *Ervilia.* Like Vicia, but the ovary is plaited in folds.
1564. *Cicer.* Cal. 5-parted, length of cor; four upper segments incumbent on the vexillum. Legume turgid, 2-seeded.
1565. *Liparia.* Cal. 5-fid, with the lower segment long. Alæ 2-lobed below. Three teeth of the larger stamen shorter than the rest. Legume ovate.
1566. *Cytisus.* Cal. 2-labiate, 2-3. Legume attenuated at base.
1567. *Mullera.* Cal. 4-toothed. Loment moniliform, with fleshy 1-seeded globules cohering by a thread.
1568. *Robinia.* Cal. 4-fid; upper segment 2-parted. Legume gibbous, long. Leaves unequally pinnate.
1569. *Caragana.* Cal. subcampanulate. Stigma smooth, truncate. Legume cylindrical. Leaves abruptly pinnated.
1570. *Swainsonia.* Cal. 5-toothed. Vexillum unfurled, larger than the blunt carina. Stigma terminal. Style bearded lengthwise in front, not bearded at back. Legume turgid, not bladdery.
1571. *Sutherlandia.* Cal. 5-toothed. Vexillum without callosities, folded back at edge, shorter than oblong carina. Stigma terminal. Style with a longitudinal beard behind, a transverse one before. Legume inflated, scariose.
1572. *Lessertia.* Cal. half 5-fid. Vexillum unfurled. Carina blunt. Stigma capitate. Style bearded transversely at end in front, beardless behind. Legume scariose without valves (compressed or inflated).
1573. *Colutea.* Cal. 5-toothed. Vexillum with two callosities, unfurled, larger than the blunt carina. Stigma lateral under the hooked end of the style, which is longitudinally bearded behind. Legume inflated, scarious.
1574. *Glycyrrhiza.* Cal. bilabiate, 3-1. Legume ovate, compressed.
1575. *Liquoritia.* Cal. tubular, equal, 5-parted. Vexillum erect, reflexed at sides. Alæ spreading. Carina bifid. Legume oblong, smooth, 3-4-seeded.

1576. *Coronilla.* Cal. 2-lipped, 2-3. Upper teeth connate. Vexillum scarcely longer than alæ. Loment round, jointed, straight.
1577. *Hippocrepis.* Loment compressed, with many notches on one edge, curved.
1578. *Ornithopus.* Legume jointed, curved, cylindrical.
1579. *Scorpiurus.* Loment intercepted by divisions, revolute, round.
1580. *Smithia.* Stamens divided into two equal bundles. Legume jointed, plaited, included in the bifid calyx.
1581. *Sesbania.* Cal. 5-toothed. Legume long (round or linear), 2-valved, many-celled, with transverse partitions.
1582. *Æschynomene.* Stamens divided into two equal bundles. Legume jointed, straight, exserted. Cal. 2-parted, with toothed lips.
1583. *Stylosanthes.* Cal. tubular, very long, bearing the corolla. Ovarium below the corolla. Loment one or two-jointed, hooked.
1584. *Hallia.* Cal. 5-parted, regular. Legume 1-seeded, 2-valved.
1585. *Lespedeza.* Cal. 5-parted, nearly equal. Carina transversely blunt. Legume lenticular, unarmed, 1-seeded.
1586. *Flemingia.* Cal. 5-fid. Vexillum striated. Legume sessile, oval, turgid, 2-valved, 2-seeded. Seeds spherical.
1587. *Zornia.* Cal. campanulate, 2-lipped. Cor. inferior. Vexillum cordate, revolute. Anthers alternately oblong and round. Legume jointed, hispid.
1588. *Hedysarum.* Cal. 5-fid. Carina transversely blunt. Loment with 1-seeded compressed joints.
1589. *Indigofera.* Cal. spreading. Carina with a spreading subulate spur on each side.
1590. *Tephrosia.* Cal. with subulate nearly equal teeth. Stamens monadelphous. Legume compressed, subcoriaceous.

History, Use, Propagation, Culture,

1500. *Monnieria.* In memory of Monsieur Le Monnier, professor of botany in the garden of plants at Paris. He published, in 1745, "Observations sur les Plantes dangereuses des Pyrénées et du Roussillon."

1501. *Petalostemum.* From πεταλον, a petal, and στημων, a stamen; in allusion to the union of these two parts into a tube.

1502. *Corydalis.* Κορυδαλις is an ancient Greek name for the Fumitory, from which genus this has been separated. Pretty little plants, well adapted for rock-work or growing on pots. They are easily cultivated and increased.

1591. *Galega.* Cal. with subulate nearly equal teeth. Legume with oblique streaks between the seeds.
1592. *Phaca.* Cal. 5-toothed, two upper teeth most distant. Legume half 2-celled, inflated.
1593. *Oxytropis.* Carina ending in a mucro. Legume 2-celled or half-2-celled, with the upper suture turned inwards.
1594. *Astragalus.* Legume 2-celled, more or less gibbous, with the lower suture turned inwards. Carina blunt.
1595. *Biserrula.* Legume 2-celled, flat, with a contrary dissepiment serrated on each edge.
1596. *Dalea.* Alæ and carina adhering to the column of stamens. Stamens 5-10, united, without a separate filament. Legume 1-seeded.
1597. *Psoralea.* Cal. the length of pod. Stamens diadelphous. Legume 1-seeded, subrostrate, valveless.
1598. *Melilotus.* Cal. tubular, 5-toothed. Carina simple, shorter than alæ and vexillum. Legume longer than calyx, rugose.
1599. *Lupinaster.* Cal. campanulate, 5-toothed, with setaceous teeth. Stigma uncinate. Legume not knotted, round, many-seeded.
1600. *Trifolium.* Legume (in general) shorter than the cal., 1 or many-seeded, indehiscent, deciduous. Flowers more or less capitate.
1601. *Lotus.* Legume cylindrical, straight. Alæ of the cor. cohering by their upper edge. Filaments dilated upwards.
1602. *Tetragonolobus.* The characters of Lotus, but the pod square with 4 wings.
1603. *Trigonella.* Vexillum and alæ nearly equal, spreading, in the form of a tripetalous corolla.
1604. *Dorycnium.* Cal. 5-toothed, 2-lipped. Filaments subulate. Stigma capitate. Legume turgid, 1 or 2-seeded.
1605. *Medicago.* Legume falcate or spirally twisted, compressed, membranaceous.
1606. *Hymenocarpus.* Like Medicago, but the legumes reniform, winged at edge.

PENTANDRIA.

9959 Stem dichotomous, Leaves ternate, Spike bifid

9960 Spike cylindrical stalked, Bractes longer than flower, Leaves in 3 pairs lanceolate
9961 Spike cylindrical stalked, Bractes subulate length of calyx, Leaflets lanceolate
9962 Spike cylindrical stalked, Bractes nearly as long as calyx, Leaves in 2 pairs linear
9963 Heads with a scaly involucre, Calyxes plumose, Leaflets linear pointless

HEXANDRIA.

9964 Stem erect simple without scales, Leaves bipinnate, Lobes cuneate cut at end, Bractes acute
9965 Stem simple without scales, Lvs. 2 biternate, Segm. cuneate multifid, Bractes ovate entire, Roots hollow
9966 Stem subsimple erect with scales below the lowest leaf, Leaves 3-4-stalked biternate, Segments obl. blunt
9967 Stem subsimple erect with scales below the lowest leaf, Lvs. 3-4-stalk. bitern. cut, Segm. cuneate or oblong
9968 Stem erect branched, Leaves glaucous decompound, Segm. stalked cuneate trifid, Pods linear
9969 Stem branched diffuse, Leaves glaucous bipinnate, Lobes obl. linear, Bractes lanceol. linear acuminate
9970 Pods roundish shorter than peduncle, Stems angular, Bractes minute, Spur very short and round
9971 Stem erect somewhat branched scarcely longer than radical lvs. Lvs. on long stalks 3-cut, Raceme few-fl.
9972 Stem branched diffuse, Lvs. bipinnate, Segm. obov. cuneate trifid, Pods lin. scarcely longer than pedicel
9973 Stem branched climbing, Leaves bipinnate, Petioles cirrhose, Segm. oval entire

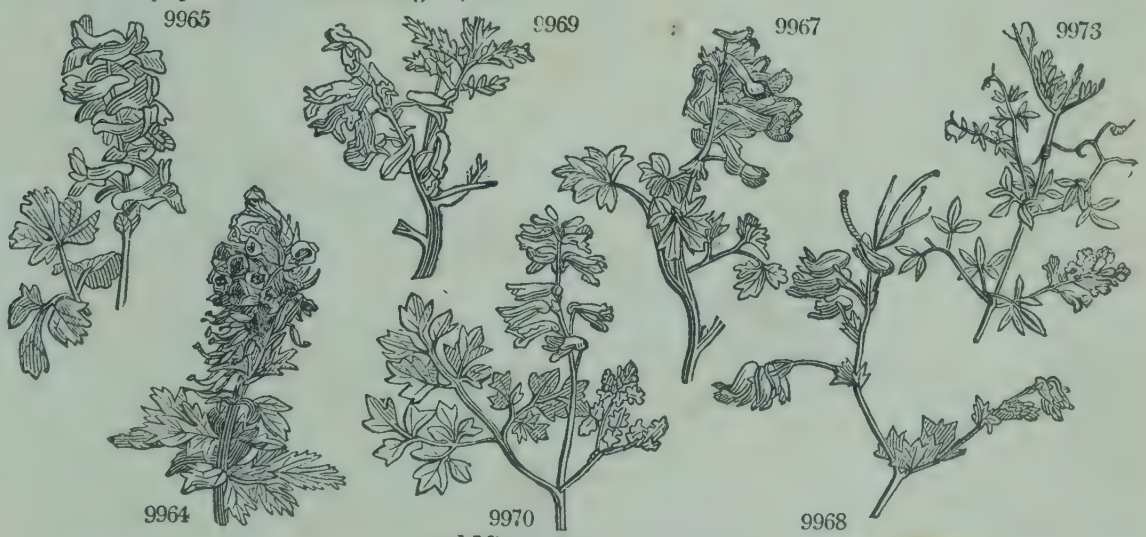
9978 Spurs 2 short blunt, Scape naked simple few-fl. Leaves multifid

9979 The only species. — Fumaria fungosa, *Hort.*



and Miscellaneous Particulars.

1503. *Cysticapnos.* From κυστις, a bladder, and καπνος, fumitory. A genus divided from Fumaria on account of its bladdery fruit.
1504. *Dictytra.* So named by Borckhausen, a German botanist, on account of the two spurs or pouches of the flower. Handsome herbaceous plants, frequently cultivated among choice collections of rare flowers. Their roots are impatient of cold and wet, and should therefore be planted in a warm dry border well exposed to the southern sun.
1505. *Adlumia.* A name unexplained by its author, M. Rafinesque Schmalz. A tall climbing annual plant of little beauty in its flowers, but covering a large space in the course of a summer.

History, Use, Propagation, Culture,

1506. *Sarcocapnos.* From σαρκος, flesh, and καπνος, fumitory. So named by Decandolle on account of the fleshy substance of the leaves of the plants contrasted with those of other allied genera.

1507. *Fumaria.* From *fumus*, smoke; in allusion to the disagreeable smell of the plant. The French, with the same meaning, call it *Fumeterre*, whence our English word *Fumitory*. The species are handsome weeds. F. officinalis was formerly considered a valuable antiscorbutic, and much used in obstructions of the viscera.

1508. *Polygala.* From πολυ, much, and γαλα, milk. Dioscorides says, that the plant was believed to excite the lacteal secretions in women. The species are handsome free-flowering plants. The greenhouse kinds are freely in sandy loam, or loam and peat; and are readily increased by cuttings of the young wood, in sand, under a bell-glass.

P. vulgaris was thought to possess something of the properties of P. Senega. Sir J. E. Smith found that an infusion of the herb taken in a morning, fasting, about a quarter of a pint daily, promoted expectoration, and was good in a catarrhous cough. He tried it at Montpelier by the advice of Professor Gouan with success, and has since known it useful. Foreign writers celebrate it as a grateful and nutritious food for cattle. According to the Swedish experiments, kine, sheep, and goats eat it, but swine refuse it.

P. Senega has a woody, branched, contorted root, about half an inch thick, and covered with ash-colored

9980 Leaves with a branched stalk triternate, Segments ovate angular

9981 Pods round retuse, Pedicels of fruit erect twice as long as bractes, Racemes lax
9982 Pods globose, Pedicels of fruit recurved longer than bract, Racemes oblong
9983 Pods globose with a little point, Pedicels of fruit erect longer than bract
9984 Pods compressed oval smooth, Raceme spiked, Pedicels much shorter than bract

OCTANDRIA.

10003 Fl. beardless axillary sessile, Leaves linear mucronate
10004 Fl. crested, Racemes axillary on long stalks, Stems erect branched upwards, Leaves linear acute
10005 Fl. beardless, Spike terminal filiform, Stem erect herbaceous quite simple, Leaves oblong lanceolate
10006 Fl. beardless, Raceme cylindr. capitate terminal, Stem simple, Leaves obl. lanc. acute
10007 Fl. beardless globose capitate terminal, Stem erect simple, Leaves linear bluntish
10008 Leaves ovate-lanceolate imbricated, Stem branched decumbent
10009 Flowers beardless, Pedunc. squarrose, Stem branched erect
10010 Flowers beardless distant, Leaves linear whorled, Stem branched
10011 Flowers beardless in headed spikes, Leaves in fours linear-lanceolate, Stem somewhat branched erect

10012 Fl. beardless lateral, Stem arborescent, Leaves 3-cornered mucronate spiny
10013 Fl. beardless, Peduncles solitary axillary, Leaves fascicled ovate mucronate ciliated at edge
10014 Fl. beardless lateral, Leaves in threes linear acute
10015 Fl. beardless sessile, Leaves round mucronate very close

10016 Leaves obovate or oval, Branches short spiny

10017 Branches a little downy, Leaves oval-obl. acute, Racemes lateral

and Miscellaneous Particulars.

park. It is inodorous; the taste is at first sweetish and nauseous, but after being chewed for less than a minute, becomes pungent and hot, producing a very peculiar tingling sensation in the fauces. Medically, it is considered stimulating, expectorant, and diuretic, and in large doses emetic and cathartic: it increases absorption, and consequently augments the natural excretions, particularly that of urine, and frequently occasions a copious ptyalism. It was introduced to the notice of physicians by Dr. Tennant, who, having discovered that it was the antidote employed by the Senegare Indians against the bite of the rattle-snake, and reasoning from the effects of the poison, and of the remedy in removing these, was induced to try it in pneumonic affections, and found it useful. On account of its stimulant properties, however, it can be employed in these complaints only after the resolution of the inflammation by bleeding and evacuations. It proves more directly useful in humoral asthma, chronic catarrh, and some kinds of dropsy. (*Thomson's London Dispensatory*, p. 450.)

1509. *Muraltia.* Named after John Von Muralt, a Swiss botanist, who lived in the commencement of the eighteenth century. Handsome bushes, of easy cultivation in a greenhouse, or even in a good pit.

1510. *Mundia.* So named, in allusion, we presume, to the neatness (*munditia*) of its appearance. No explanation of the word is given by its author. Pretty little Cape bushes, easily cultivated in a good pit.

1511. *Securidaca.* From *securis*, a hatchet, in allusion to the form of the end of the pod. It grows freely in light loam, or loam and peat; and cuttings root in sand covered with a glass.

History, Use, Propagation, Culture,

1512. *Nissolia.* In honor of William Nissole, an industrious French botanist. He was a member of the academy of Montpellier, and author of some papers in its Transactions. He was born in 1647, and died in 1735. Cuttings root in sand, but not very readily.

1513. *Dalbergia.* Nicholas Dalberg was surgeon in ordinary to the king of Sweden, and published in 1755 a work upon the Metamorphoses of Plants. Another Dalberg, a pupil of Linnæus, travelled in Dutch Guiana, whence he communicated specimens to his preceptor. Ripened cuttings root in sand.

1514. *Pongamia.* An alteration of the vernacular name of the plant in India.

1515. *Pterocarpus.* From πτερον, a wing, and καρπος, fruit. Its pods have membranous wings. P. santalinus is a lofty tree, with alternate branches, and a bark resembling that of the common alder; it yields the true officinal red saunders wood, first detected by Kœnig in India. It is brought home in billets, which are very heavy, and sink in water. Red saunders wood has an aromatic odor, and is nearly insipid. It is extremely hard, of a fine grain, takes a high polish, and a bright garnet red color, which deepens on exposure to the air. It yields its coloring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. (*Thomson's London Dispensatory*, 458.)

The sap yields one sort of Sanguis draconis. Many of the red Indian woods trasude a blood red juice through the clefts of the bark, which hardens into a red resin, not differing from Sanguis draconis, which, therefore, is collected from several trees, and from this among others. (*Linn. Suppl.*) This drug, however, is chiefly obtained from the P. Draco, and the fruit of Calamus Rotang.

In our stoves these plants thrive in light loamy soil; and cuttings, with their leaves untouched, will root in sand under a common hand-glass.

1516. *Ecastaphyllum.* From εκαστος, every one, and φυλλον, a leaf; that is to say, a leaf which is always simple, and not compounded of several others, as those of neighbouring genera.

1517. *Geoffroya.* In honor of Etienne Francois Geoffroi, Memb. Acad. Par., Professor of botany at the Jardin du Roi, and a foreign member of the Royal Society of London. He was the author of several medical botanical works, especially of a Materia Medica. He was born in 1672, and died in 1731. A tree, branchy at top, with a smooth grey bark and pinnate leaves; and, what is remarkable in papilionaceous plants, a drupe for a fruit.

DECANDRIA.

10018 Stem shrubby twining, Leaves pinnated, Leaflets ovate acute smoothish
10019 Leaves pinnated, Leaflets ovate-oblong emarginate
10020 Leaves ternate and quinate, Leaflets oval acuminate smooth, Fl. racemose

10021 Leaves pinnated, Leaflets roundish emarginate, Fruit lanceolate
10022 Leaves pinnated, Leaflets obl. obtuse, Branches and petioles downy
10023 Leaves pinnated, Leaflets ellipt. emarginate smooth, Panicle terminal, Fruit lanceolate

10024 Leaves pinnated, Leaflets ovate acuminate smooth, Fruit ovate acute veinless

10025 Leaves pinnated, Leaflets elliptical emarginate, Stipules none, Panicle termin.
10026 Leaves pinnated, Spines stipulary, Fruit lunate
10027 Leaves ternate roundish blunt quite smooth, Petals crenate wavy

10028 Leaves simple cordate-ovate downy beneath

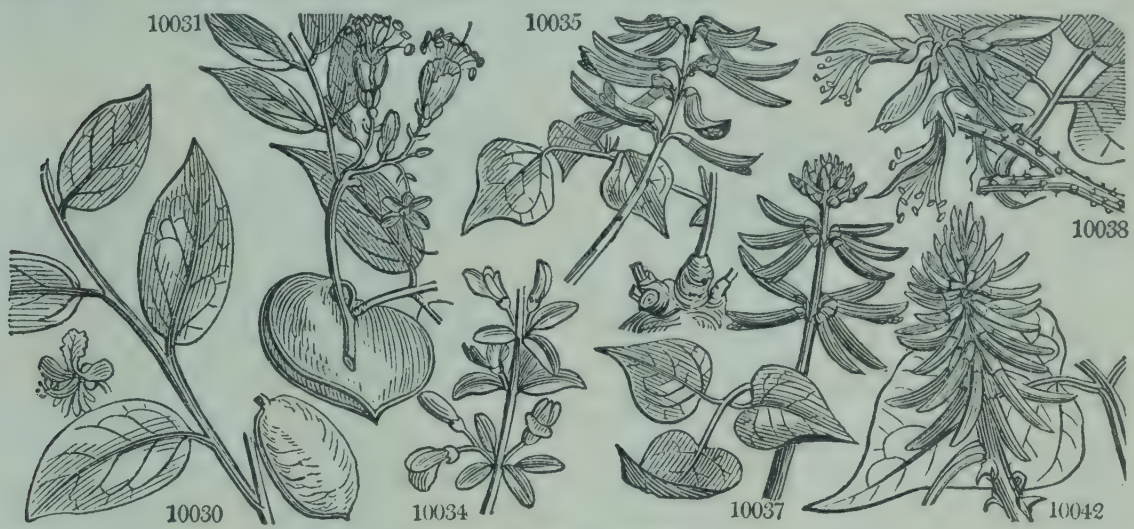
10029 Unarmed, Leaflets ovate-lanceolate

10030 Leaves alternate, Raceme terminal

10031 Leaves pinnated, Flowers smooth

10032 Unarmed, Leaves simple stalked alternate subcordate ovate, Racemes compound axillary and lateral
10033 Leaves pinnated, Leaflets ovate acuminate, Stem arboreous
10034 Spiny, Leaves subsessile aggregate obovate oblong, Peduncles 2-flowered

10035 Leaves ternate rhomboid smooth, Stem herbaceous unarmed, Calyxes truncate
10036 Leaves ternate smooth, Stem arboreous prickly, Calyxes campanulate truncate
10037 Leaves ternate unarmed, Stem arboreous prickly, Calyxes truncate 5-toothed
10038 Leaves ternate unarmed, Stem arboreous prickly, Calyxes spathaceous
10039 Leaves ternate unarmed lanceolate, Stem arboreous prickly, Calyxes bifid
10040 Leaves ternate unarmed, Leaflets blunt, Stem arboreous prickly
10041 Leaves ternate prickly, Stem arboreous prickly
10042 Leaves ternate prickly beneath, Petioles unarmed, Stem prickly



and Miscellaneous Particulars.

This drupe is large, subovate, and incloses a woody nut. The bark, which has a mucilaginous sweetish taste and a disagreeable smell, was first noticed as a vermifuge by Peter Duguid; but Dr. Wright, who resided a long time at Jamaica, has communicated the fullest information concerning this tree. According to him, the bark is powerfully medicinal; and its anthelmintic effects have been established at Jamaica by long experience.

1518. *Dipterix.* From δις, double, and πτερυξ, a wing, in allusion to the two appendages of the calyx. A tree much branched at top, with large alternate pinnate leaves, and racemes of flowers succeeded by almond-like fruits. The kernels of these are very fragrant, and are put by the Creoles into chests of clothes, in order to drive away insects, and communicate a grateful odor. They are in their own country called *Tonga*, and are the sweet-scented seed sold in shops under the corrupted name of *Tonquin* bean, for perfuming snuff and other substances. Ripened cuttings root in sand in moist heat.

1519. *Parivoa.* The name of the tree in Guiana. A very handsome tree.

1520. *Amerimnum.* One of the names given to the Houseleek by the Greeks. It is derived from α, privative, and μεριμνα, care, because the plants require no attention. It is not easy to tell why the name was applied to this genus, which has nothing in common either with the Houseleek or its ancient name. A. Ebenus is common in the West Indies, and the wood is sent to Europe under the name of American Ebony. Though not the true ebony, yet being of a fine greenish-brown color, and polishing well, it is much coveted by the instrument makers, and is of a very hard durable nature. The flowers of Amerimnum latifolium are yellow, and smell like new hay. In our stoves the species may be treated like Pterocarpus.

1521. *Erythrina.* From ερυθρος, red; nearly all the species being remarkable for the brilliant scarlet color of their flowers. The species are small trees, prickly or unarmed, or else shrubs, sometimes almost herbaceous; leaves, as in Dolichos, ternate, stipulaceous, the petiolules jointed and awned, or glandular, very seldom simple; flowers in fascicles from the axils, or in spikes at the end of the stem and branches, often scarlet. (*Jussieu.*)

In our stoves they thrive well in a light loamy soil. "The best way to flower them," Sweet observes, "is to place them on a dry shelf in winter, when they have no leaves, and give them scarcely any water; when they show flower-buds, they may be plunged in a moist heat, which will make the flowers finer than they

History, Use, Propagation, Culture,

would be, if the plants stay out till they are in bloom. Cuttings taken off at a joint, and planted in sand, without being deprived of any of their leaves, strike root readily under a hand-glass in moist heat." (*Bot. Cult.* 54.)

1522. *Butea.* Named in honor of the late Earl of Bute, a munificent patron of botanical science. This splendid genus, though of free growth and easy propagation, is yet rare in British collections. From B. frondosa is obtained the *Gum lac* of commerce. Infusions of the flowers dye cotton cloth, previously impregnated with a solution of alum, or of alum and tartar, of a beautiful yellow color. The plant grows in loam and peat, and "cuttings should be taken off at a joint, and planted in a pot of sand, without being deprived of any of their leaves: one pot is enough under a hand-glass, as the leaves take up much room, and, if too confined, are apt to damp off. They should be plunged in a moist heat." (*Bot. Cult.* 30.)

1523. *Viborgia;* usually written *Wiborgia*, received its name after M. Eric Viborg, a learned and acute Danish botanist, author of several botanical treatises in his own language in the end of the eighteenth century. The species, like those of the four preceding genera, may be treated as Scottia.

1524. *Piscidia.* From *piscis*, a fish; the inhabitants of America use the bark as a fish poison. This tree has spreading branches and pinnate leaves, and is very common in Jamaica, where it is reckoned one of the best timber-trees in the island. The wood is very hard and resinous, and lasts almost equally in or out of water. It is of a light-brown color, coarse, cross-grained, and heavy. (*Browne.*) It makes excellent piles for wharfs. The stakes soon form a good live fence. The bark of the trunk is very astringent; a decoction of it stops the immoderate discharge of ulcers, especially when it is combined with the mangrove bark; it cures the mange in dogs, and would probably answer well for tanning leather. (*Long*, 824.) The bark of the root is used for the same purposes and with the same effects as the leaves and branches of Surinam poison; it is pounded and mixed with the water in some deep and convenient part of a river or creek, whence it may spread itself;

10043 Leaves ternate, Petioles prickly glandular, Stem arboreous unarmed
10044 Leaves ternate oblong oval blunt

10045 Branches downy, Leaflets roundish emarginate
10046 Branches smooth, Leaflets obovate roundish blunt

10047 Leaflets and twiggy branches pubescent

10048 Leaves unequally pinnate, Leaflets ovate

10049 Leaves cordate ovate, Ovary hairy
10050 Leaves lanceolate ovate, Ovary smooth
10051 Leaves deltoid or hastate with spiny angles

10052 Leaves sublinear acute villous beneath, Heads terminal
10053 Leaves lanceolate 3-nerved entire
10054 Leaves lanceolate many-nerved entire
10055 Leaves amplexicaul. entire netted
10056 Leaves amplexicaul. wavy with a reflexed mucro
10057 Leaves cordate many-nerved entire
10058 Leaves cordate many-nerved toothletted
10059 Leaves ovate cordate acuminate pungent, Stem hirsute
10060 Leaves rigid pointed pungent oblong dense

10061 Leaves ovate smooth, Branches angular, Peduncles 3 lateral 1-flowered

10062 Leaves fascic.ed 3-angular mucronate stiff hairy, Heads hairy
10063 Leaves fascicled filiform silvery blunt, Racemes leafy, Flowers not hairy
10064 Leaves fascicled subulate smooth, Pedunc. filiform twice as long as leaf
10065 Leaves fascicled filiform blunt hairy, Flowers somewhat racemose
10066 Leaves fascicled 3-cornered mucronate hairy, Flowers lateral
10067 Leaves fascicled fleshy round smooth, Fl. lateral and terminal, Flowers smooth
10068 Leaves fascicled fleshy round smooth setaceous at end, Fl. capitate terminal
10069 Leaves fascicled scabrous somewhat hairy, Heads terminal
10070 Leaves fascicled filiform mucronate smooth, Flowers lateral
10071 Leaves fascicled 3-cornered mucronate smooth
10072 Leaves linear downy imbricated, Heads terminal crowded
10073 Leaves fascicled filiform lax hairy, Heads hairy
10074 Leaves quinate sessile, Peduncles 1-flowered
10075 Leaves ternate and fascicled ovate silky, Heads downy, Stem dichotomous
10076 Leaves ternate and fascicled filiform silky, Fl. somewhat lateral, Vexillum naked
10077 Leaves three 3-cornered smooth, Spikes ovate
10078 Leaves ternate, Leaflets blunt, Branches spiny
10079 Leaves fascicled fleshy round smooth, Flowers lateral without bractes, Branches twiggy

and Miscellaneous Particulars.

in a few minutes the fish that lie hid under the rocks or banks rise to the surface, where they float as if they were dead; most of the large ones recover after a time, but the smaller fry are destroyed. The eel is not intoxicated with common doses, though it is affected very sensibly; for the moment the particles spread where it lies, it moves off with great agility. Jacquin observes that this quality of intoxicating fish is found in many other American plants.

It is a very free grower in our stoves, but is seldom allowed to grow large enough to flower. Cuttings root in sand under a hand-glass.

1525. *Platylobium.* From πλατυς, broad, and λοβος, a pod, in allusion to the form of the pod. Handsome free-flowering plants, which grow in sandy loam and peat; and are increased by cuttings in sand under a hand-glass, or by seeds.

1526. *Borbonia.* In memory of Gaston Bourbon, Duke of Orleans, son of Henry IV. of France, a great lover and patron of botany. See Gastonia. Shrubs of easy culture and propagation.

1527. *Rafnia.* Named, according to Sir James Smith, after Mr. C. G. Rafn of Copenhagen, author of a Flora of Denmark and Holstein, published in 1796 and 1800, in two octavo volumes. A genus of Cape plants, separated from the Linnean Crotalaria and Liparia.

1528. *Aspalathus.* A native of the island *Aspalathus* on the coast of Lycia. It was a common practice with the ancients to fix the names of places upon certain plants, as Cytisus, Lycium, and others. It is not certain what plant the ancients intended by their Aspalathus. Shrubs and under-shrubs, with fasciculate linear leaves, and yellow flowers, all of which grow freely in a mixture of sandy loam and peat; and young cuttings, planted in sand under bell-glasses will strike root freely, if the glasses are wiped occasionally, otherwise they are liable to damp off. Some species ripen seeds freely, by which young plants are readily produced. (*Bot. Cult.* 140.)

History, Use, Propagation, Culture,

1529. *Sarcophyllum.* From σαρξ, flesh, and φυλλον, a leaf. The leaves are thick and fleshy. A somewhat succulent plant, easily injured by over-watering; but otherwise not difficult to preserve or increase.

1530. *Crotalaria.* Κροταλον was the name of a noisy Greek musical instrument, similar to the cymbals of the present day. The pods of this genus are inflated, and rattle, when shaken, in a similar manner. The species are all of easy culture, mostly free-flowerers; but they are shabby plants under cultivation, and possess no good quality which can render them objects of interest or beauty.

1531. *Bossiæa.* Named by Ventenat, after M. Boissieu-Lamartiniére, who accompanied the unfortunate La Pérouse in his voyage round the world. This beautiful genus, according to Sweet, "thrives best in an equal mixture of sandy loam and peat; if not very sandy, some sand must be added to it to have the plants in health. The pots must be well drained with broken potsherds, as nothing injures them more than too much

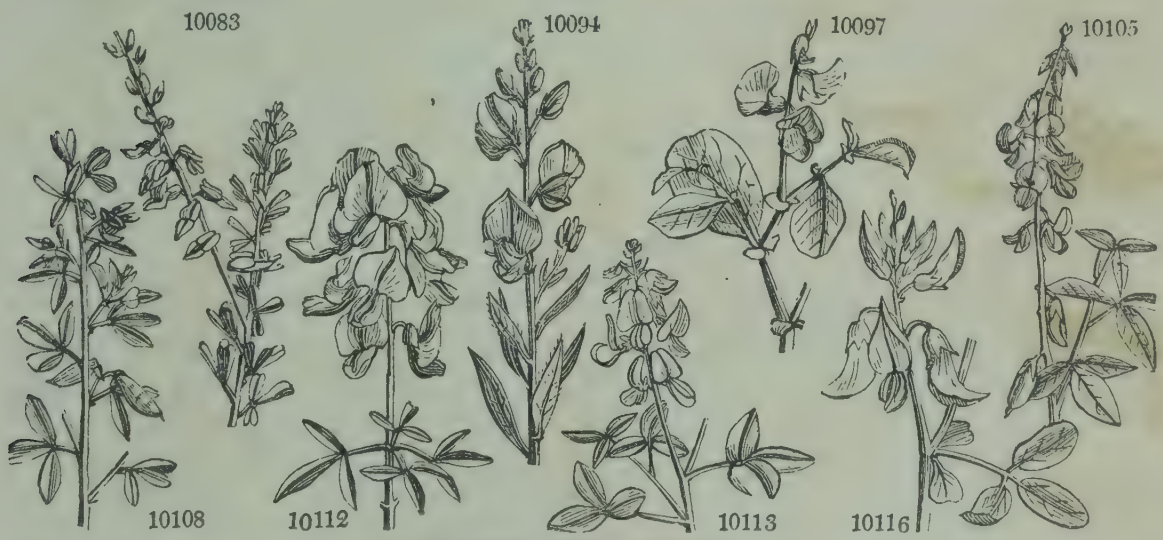
10080 The only species

10081 Leaves simple obl. lanceolate, Stipules lanceolate acuminate decurrent, Racemes opposite the leaves
10082 Leaves simple lanc. ellipt. blunt downy beneath, Racemes opposite the leaves
10083 Leaves very small ternate glaucous, Racemes few-flowered, Vexillum reflexed
10084 Leaves simple lanc. villous, Upper stipules lanc. decurrent, Racemes opposite the leaves, Cal. villous
10085 Branches winged upwards, Lower leaves obl.: upper lanc. acute hairy, Racemes lateral
10086 Leaves simple lin. lanc. acute villous beneath, Flowers and pods inclosed in hairy calyx
10087 Leaves simple long-lanc. Pods downy, Raceme terminal, Stem square
10088 Leaves obl. lanceolate silky beneath, Fl. racemose, Bractes linear much shorter than pedicel
10089 Leaves simple lanc. Upper stipules decurrent with 2 short teeth, Racemes opposite the leaves
10090 Leaves lanceolate subsessile. Lower lip of cal. 3-parted beyond the middle, Stem virgate simple
10091 Leaves simple lanc. subsessile, Pods smooth, Raceme terminal, Stem furrowed
10092 Leaves lanceolate blunt hairy, Fl. terminal, Calyx hairy as long as corolla
10093 Leaves lanceolate, Raceme terminal, Cal. very villous as long as corolla
10094 Leaves simple ov. lanceolate silky ciliated, Standard large erect pointed
10095 Leaves simple lanc. beneath, Pods silky, Raceme terminal, Stem furrowed
10096 Leaves simple obl. cuneiform retuse, Raceme terminal
10097 Leaves simple ovate retuse, Stipules lunate declinate, Raceme term. Branches square
10098 Leaflets 3 oval acute, Hairs shining scattered, Racemes opposite the leaves
10099 Leaflets 3 oval blunt with scattered hairs, Raceme terminal long, Keel shorter than vexillum
10100 Leaves simple obovate oblong silky on each side, Pod 4-seeded length of calyx
10101 Stems round striated, Leaves oval emarginate mucronate, Stipules lunate amplexicaul
10102 Leaves simple lin.-lanceolate blunt hairy, Pedunc. terminal subsolitary, Stem branched diffuse
10103 Leaves simple obl. blunt hairy, Stems prostrate herbaceous, Pedunc. 2-3-fl. axillary
10104 Leaflets 3 oblong blunt mucronate with scattered hairs beneath, Raceme terminal, Calyxes silky
10105 Leaves ternate, Leaflets oval-lanc. acute twice as long as villous petiole, Pods pendulous
10106 Leaves obovate cuneate silky, Racemes term. Bractes and calyx colored
10107 Leaves obl. blunt silky villous, Stipules linear subulate reflexed, Panic. terminal bracteate
10108 Leaves ternate, Leaflets cuneiform emarginate silky beneath, Peduncles axillary solitary 1-flowered
10109 Leaves ternate ovate acuminate smooth, Stipules none, Raceme terminal, Pods stalked pendulous
10110 Leaves ternate obcordate mucronate, Flowers corymbose, Stem shrubby
10111 Leaves ternate, Leaflets obovate retuse, Racemes terminal
10112 Leaves ternate, Leaflets linear lanceolate acute half as long again as petiole downy beneath
10113 Leaves ternate on long stalks, Leaflets oval downy, Racemes axillary lax, Standard blunt
10114 Leaves ternate obl. lanceolate acute silky beneath, Stipules lanceolate subulate, Pedunc. axill. 1-flowered
10115 Leaves ternate obovate strigose beneath, Stipules lanceol. and bractes ovate reflexed, Racemes terminal
10116 Leaves ternate obovate, Stipules leaf-like stalked, Racemes terminal, Pods stalked
10117 Leaves ternate oval villous beneath, Racemes spiked, Keel downy at edge, Pods sessile hairy
10118 Leaves ternate lanceolate smooth, Racemes terminal spiked
10119 Leaves ternate lanc. hoary silky shorter than petiole, Raceme terminal
10120 Leaves quinate

10121 Branches flat linear leafless, Denticulations flower-bearing, Keel naked, Calyx smooth
10122 Branches flat linear leafless, Denticulations flower-bearing, Keel fringed, Calyx smooth
10123 Branches leafy compressed, Leaves obovate and linear flat, Pod many-celled with spongy septa
10124 Branches leafy compressed, Leaves linear with recurved edges, Pod 1-celled
10125 Branches leafy filiform, Leaves oval smooth, Stipules shorter than petiole, Pod 1-celled
10126 Branches leafy round, Stem erect much branched, Leaves ovate-lanc. rough above
10127 Branches leafy spiny round, Leaves obcordate cuneiform

10128 The only species

10129 Leaves green retuse
10130 Leaves glaucous blunt



and Miscellaneous Particulars.

water. Cuttings, not too ripe, will strike root if planted in sand under a bell-glass, not too close together, as they are apt to damp; when rooted, they must be potted off in little pots and kept in a close frame, and hardened to the air by degrees." (*Bot. Cult.* 151.)

1532. *Scottia.* Named in memory of Robert Scott, M. D., formerly professor of botany at Dublin. A shrub found by Mr. Brown upon the south-west coast of New Holland. Young cuttings root in sand under a bell-glass.

1533. *Templetonia.* Named after John Templeton, Esq., of Orange Grove, near Belfast, a gentleman to whom the editor of the English Botany was under frequent obligations for Irish plants during the progress of that work.

History, Use, Propagation, Culture,

1534. *Goodia.* In memory of Peter Good, an industrious gardener employed by the Kew garden in collecting seeds in New Holland, where he died.

1535. *Loddigesia.* Named in compliment to Mr. Conrad Loddiges, a successful cultivator of plants, an assiduous collector, and a most worthy man, whose virtues are inherited by his sons.

1536. *Hovea.* In honor of Mr. Antony Pantaleon Hove, a Polish botanist, who travelled in the Crimea and Persia, whence many plants were sent to Kew garden. He is still alive, and naturalized in England. Pretty plants, easily cultivated in sandy loam and peat, and rooted in sand under a hand-glass.

1337. *Spartium.* From σπαρτον, cordage; the earliest ropes were made of this and similar tough plants. The species are shrubs thick-set with verdant flexible rush-like twigs, which are very ornamental in winter, and generally profusely covered with shewy white or yellow odoriferous and mellifluous blossoms in summer. S. junceum is grown as a green food for sheep in the south of France, and there and in Spain it affords a thread from its fibres, which is sometimes wove into cloth, but more generally twisted into cordage. Bees are very fond of the flowers, as they are of those of most of the species.

S. monospermum, is a very handsome shrub, remarkable for its numerous snow-white flowers. Osbeck remarks, that it grows like willow-bushes along the shore of Spain, as far as the flying sands reach, where scarcely any other plant exists except the Ononis repens, or creeping Restharrow. The use of this shrub is very great in stopping the sand. The leaves and young branches are delicious food for goats. It converts the most barren spot into a fine odoriferous garden by its flowers, which continue a long time. It serves to shelter hogs and goats against the scorching heat of the sun. The twigs are used for tying bundles; and all kinds of herbs that are brought to market are fastened together with them. Forskahl found it in Arabia; and Desfontaines in Barbary, on the sandy coast. The Spaniards call it *Retamas*, from the Arabic name *Rætam.*

10131 Leaflets obovate and calyxes smooth, Pod varicose
10132 Leaflets obovate cuneate and calyxes downy, Pod smooth

10133 The only species

10134 Leaves linear hairy beneath, Pods smooth
10135 Leaves long linear; beneath veiny, Pods downy
10136 Branches twiggy, Leaves lanc. mucronate downy beneath, Fl. axill. twin
10137 Leaves elliptic oblong
10138 Leaves lanc. somewhat rhomboid blunt at end mucronate, Peduncles axillary many-flowered

10139 Branches opposite round flowering at end, Leaves lanceolate

10140 Branches round striated, Racemes lateral few-fl. Flowers subaggregate, Leaves lanceolate silky
10141 Branches round striated, Racemes lateral many-fl. Flowers remote, Leaves lanc. sessile a little hairy
10142 Branches round striated, Fl. solitary axillary, Pods villous, Leaves lanceolate hairy
10143 Branches round striated very close, Fl. terminal racemose, Vexillum smooth, Leaves lanc. silky
10144 Branches round striated, Fl. axill. solitary subracemose, Standard and keel downy, Lvs. obl. lanc. silky
10145 Branches round striated, Fl. axillary solitary, Leaves lanc. silky subsessile
10146 Branches round striated, Fl. term. capitate, Leaves lin. lanc. silky
10147 Branches round striated spreading spiny, Pedunc. axill. many-fl. Leaves obl. acute silky
10148 Leaves lanc. silky beneath, Corolla silky, Branches erect round
10149 Leaves ternate and simple silky, Twigs straight striated flowering on all sides
10150 Leaves solitary and ternate linear lanceolate hoary, Branches hexangular flowering at the ends
10151 Leaves ternate stalked obovate, Branches round striated, Lateral flowers twin nodding
10152 Branches angular, Leaves simple lanceolate silky beneath, Fl. racemose, Pods hairy
10153 Branches round with ten furrows, Flowers axillary solitary downy
10154 Leaves ternate lanc. hairy stalked, Fl. lateral fascicled, Pods smooth, Branches round striated
10155 Leaves ternate sessile linear silky beneath, Raceme terminal, Branches round furrowed
10156 Leaves ternate and solitary oblong, Fl. axillary, Pods hairy at edge, Branches angular
10157 Leaves ternate linear, Petioles dilated persistent, Racemes capitate term. Branches angul. opp. clustered
10158 Leaves ternate and simple oblong mucronate, Raceme terminal, Branches striated round spiny
10159 Leaves ternate obovate, Peduncles axillary, Cal. and pods smooth, Branches angular spiny

10160 Leaves tern. obl. downy beneath with spreading hairs, Pedunc. many-fl. terminal, Branches angular
10161 Leaves ternate obovate downy with closely pressed hairs, Pedunc. many-fl. terminal, Branches angular
10162 Leaves ternate obl. smooth, Racemes terminal, Cal. and pods glandular viscid, Branches round striated
10163 Leaves ternate: upper simple, Branches triquetrous procumbent
10164 Branches 2-edged membranous jointed, Leaves ovate lanceolate
10165 Leaves lanceolate mucronate smooth, Branches 3-cornered ascending, Pods smooth
10166 Leaves lanceolate smooth, Branches round striated erect, Pods smooth
10167 Leaves lanceolate smooth, Branches equal round erect
10168 Leaves oblong ovate and pods hairy, Branches round striated
10169 Quite smooth, Leaves not ciliated, Cor. 5 lines long, Calyx smooth

and Miscellaneous Particulars

S. scoparium, though in some places a troublesome weed in old pastures, is a very ornamental shrub in garden scenery: it is also useful in agriculture, domestic economy, and medicine. It is sometimes used as winter food for sheep, frequently for thatching cottages and ricks, and as litter. Bees are fond of the flowers: the flower-buds, just before they become yellow, are pickled in the manner of capers: the branches are said to be capable of tanning leather, and of being manufactured into coarse cloth; when tender, they are mixed with hops in brewing: the old wood furnishes the cabinet-maker with a beautiful material for veneering. The twigs, when bruised, smell disagreeably, which perhaps may be one reason why our broom is generally rejected by cattle (*Curtis*); but they have also a nauseous bitter taste. The plant when burnt affords a tolerably pure alkaline salt. Broom tops are diuretic and cathartic; the seeds are said to be emetic. The effects of this plant have been very long known to the common people; and both Mead and Cullen found them useful in dropsy. The usual mode of exhibiting them is in the form of decoction, made by boiling the green tops in water. Speaking of this decoction, of which two table spoonfuls were given every hour till it operated by stool, Cullen says, "it seldom fails to operate both by stool and urine, and by repeated exhibition every day, or every second day, some dropsies have been cured. (*Thompson's London Dispensatory*, 514.)

1338. *Genista*. *Gen*, signifies, in Celtic, a small bush, whence also *Gênet*, French. The species are shrubs or undershrubs, some of them evergreen, and many with numerous flexible rush-like green twigs like the brooms. They are of easy culture and free flowerers. G. tinctoria is common in most parts of Europe, in unimproved pastures on dry gravelly soils. When cows feed on it, their milk, and the butter or cheese made from it, are said to be very bitter. A bright yellow color may be prepared from the flowers; and for wool that is to be dyed green with woad, the dyers prefer it to all others. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore

History, Use, Propagation, Culture,

has proved serviceable in dropsical cases. A salt prepared from the ashes is recommended in the same disorder.

G. triquetra is the handsomest hardy species: it is evergreen, and produces a vast profusion of bloom.

1539. *Lebeckia.* Named by Thunberg: possibly in honor of some forgotten botanist. Young cuttings root freely in sand under close cover.

1540. *Ulex.* A word of very obscure meaning. De Theis derives it from *ac*, a point in Celtic. U. europæus, *Jonc-marin*, Fr., is a beautiful evergreen shrub, which flowers freely, both when wild and cultivated, the greater part of the year. It abounds in some places, and there it is despised by the common people; but the greatest botanists have admired its deep green shoots and leaves, brilliant yellow flowers, and tufted picturesque shape. About Petersburg, it forms one of their most valuable greenhouse plants, flowering in winter. Linnæus lamented that he could hardly preserve it alive in a greenhouse. Many parts of Germany are wholly destitute of the furze bush, insomuch that Dillenius was in a perfect extasy when he first saw our commons covered with its golden flowers. And Gerard relates, that about Dantzic, Brunswick, and in Poland, there was not a branch of it growing, except some few plants and seeds that he sent, which were most curiously kept in their fairest gardens. As an agricultural plant the furze has been sown in several parts of the island as hedges; but excepting where it occupies a breadth of ten or twelve feet on a raised mound, it does not last long, getting naked below. Sown on a mound the sides may be cut, and the prunings used as fuel or as green food, and the fence thus rendered close at bottom and durable. It is sown in fields, and

10170 Leaves lanceolate silky, Branches striated round, Racemes 1-sided
10171 Leaves lanceolate acute, Pedunc. axill. 3 longer than leaves, Cor. smooth, Branches striated round
10172 Leaves lanceolate blunt silky beneath, Pedunc. axillary as long as leaf, Cor. silky, Branches angular

10174 Leaves lanceolate smooth subciliate, Pedunc. axillary, Cor. smooth, Branches 3-cornered procumbent
10175 Leaves lanceolate silky beneath, Fl. terminal somewhat racemose, Cor. silky, Branches erect round
10176 Spines simple or compound, Flowering branches unarmed, Leaves oblong smooth, Racemes leafy term.
10177 Spines warted compound, Fl. branches unarmed, Lvs. lanc. hairy, Racemes term. naked, Keel pubesc.
10178 Spines compound pungent, Leaves lanceolate villous, Racemes terminal subcapitate
10179 Stem leafless, Spines crossing each other
10180 Leaflets ternate obovate, Racemes short, Bractes linear under the flower

10181 Leaves simple linear filiform smooth, Flowers umbelled
10182 Leaves ternate silky, Leaves linear, Flowers racemose
10183 Leaves ternate villous, Raceme long terminal
10184 Leaves simple binate or ternate sessile lanceolate acute rough

10185 Teeth of cal. conniving, Bractes ovate loose
10186 Teeth of cal. distant, Bractes minute appressed

10187 Fl. solitary larger than leaflet, Lower leaves ternate lanceolate toothed at end, Branches spiny smooth
10188 Fl. twin axillary, Lower leaves ternate lanc. serrate, Branches spiny villous
10189 Fl. twin, Lower leaves ternate ellipt. serrate pubescent, Stem unarmed villous viscid
10190 Fl. solitary axill. Lower leaves ternate roundish serrate, Branches ascending spiny villous
10191 Fl. subsess. lateral, Leaves ternate obl. pubesc. Stipules lanc. toothletted, Cal. scarious longer than cor.
10192 Fl. sessile spiked, Bractes stipular ovate ventricose scarious imbricated
10193 Fl. subsess. lateral spiked, Leaves simple ovate blunt, Stipules dilated, Cal. larger than smooth corolla
10194 Fl. somewhat stalked axill. Lvs. simple obov. striated serrated, Stipules ovate toothed, Stem procumbent
10195 Pedunc. unarmed very short, Upper leaves simple, Stipules ovate lanc. entire
10196 Racemes straight, Leaves cuneiform, Pods nodding linear recurved
10197 Leaves ternate obovate, Pedunc. lateral 2-flowered
10198 Pedunc. unarmed 1-fl. Leaves ternate roundish crenate, Pods cernuous
10199 Pedunc. unarmed 1-fl. Leaves ternate cuneate, Stipules serrate, Stems prostrate
10200 Pedunc. 1-fl. awned, Leaves sessile ternate, Stipules sheathing toothed
10201 Pedunc. 1-fl. awned, Leaves tern. cuneate toothed at end villous viscid, Cal. larger than corolla
10202 Pedunc. 1-fl. awned length of leaves, Leaves simple oblong serrated viscid : lower ternate
10203 Pedunc. 2-fl. awned shorter than petiole, Leaves tern. oblong, Pods linear cernuous
10204 Pedunc. 1-fl. awned longer than leaf, Awns length of cor. Leaves ternate lanc. serrated at end
10225 Pedunc. 1-fl. awned longer than leaf, Leaves ternate viscid obl. toothed at end
10206 Pedunc. awned about 1-fl. Leaves all ternate channelled recurved wholly serrated

10207 Shrubby, Leaves tern. linear fleshy 3-toothed, Pedunc. 2-flowered
10208 Shrubby, Leaves tern. roundish wavy toothed viscid, Pedunc. 1-flower unarmed
10209 Shrubby, Leaves sessile ternate lanceolate serrated, Stipules sheathing, Pedunc. 3-flowered
10210 Shrubby, Leaves tern. ovate toothed, Cal. with 3 bractes, Pedunc. 3-flowered

10211 Herbaceous, Leaves quaternate-pinnate, Flowers lateral
10212 Herbaceous, Leaves pinnated unequal, Head double

and Miscellaneous Particulars.

allowed to grow three or four years, and then it is cut down for fuel or for heating ovens; but the most profitable application of furze, whether sown or grown wild, is that of using it as green food for cattle. For this purpose, the shoots should not be more than two years old, and they require to be passed between rollers to bruise the ligneous parts and the thorns. It has been tried in this way by a number of agriculturists, and found a highly nutritive food for horses, oxen, and kine. Though a hardy plant and enduring the sea breeze, yet it is frequently killed by severe winters. It is never found on wet-bottomed clays, but generally on dry rocky or stony soils. There is a very luxuriant variety called the Irish whin, and one with double flowers found a few years ago in Devonshire, and now in propagation by cuttings in the nurseries.

U. nanus greatly resembles the common species, but is smaller in all its parts. It flowers from August to January, which renders it valuable in shrubberies as a successor to the other.

1541. *Ononis.* From ονος, an ass, because asses only feed upon so prickly a plant. O. spinosa, *Arrête boeuf*, Fr., *Rest harrow*, Eng., was formerly very troublesome in corn fields, on account of its long ligneous roots obstructing the progress of the plough, and its thorny branches the harrow: but in all properly cultivated lands the plant has disappeared. It is frequent in aboriginal pastures on dry soils, and is eaten by cows, sheep, and goats, but not freely by horses. All the species are of easy culture, and the greenhouse kinds are readily increased by young cuttings under a bell-glass in sand.

1542. *Anthyllis.* From ανθος, a flower, and ιουλος, a beard. So called from the silky appearance of its heads of flowers; whence also one species is called Barba Jovis. A. Vulneraria is recommended as a herbage

History, Use, Propagation, Culture,

plant by some agricultural writers, as A. Young; and is by others confounded with Birdsfoot trefoil (Lotus corniculata, and major), and with the Liquorice-vetch (Astragalus glycyphyllos), to which, to a cursory observer, it bears considerable resemblance. Linnæus observes, that in Oeland, where the soil is a red calcareous clay, the flowers of Anthyllis vulneraria are red; but that in Gothland, where the soil is white, the flowers also are white: ours are yellow.

A. Barba Jovis is a silvery looking bush, with white and hairy leaves, pale yellow flowers, and woolly pods. Like most of the Leguminosæ, this genus seeds freely; but in default of seeds, increase may be effected by "young cuttings planted under a bell-glass in sand, which are not difficult to root: the glasses must be kept wiped, or the dew is apt to make them mouldy, which destroys them." (*Bot. Cult.* 135.)

1543. *Arachis.* *Aracos*, or *Aracidna*, is a name applied by Pliny to a plant which had neither stem nor leaves, but was all root. The moderns have applied it to a plant, the fruit of which is borne underground. The specific name *hypogæa* (υπο γη, below ground), is in allusion to the curious circumstance of the pods, as they increase in size, forcing themselves into the earth, where they ripen their seeds, thence called earth-nuts. The plant is generally cultivated in the warmer parts of North and South America, but is supposed to be originally from Africa. In South Carolina the seeds are used as chocolate; in the eastern countries as almonds, and in Cochin-China they furnish an oil used for lamps, and as a substitute for oil of olives. About Paris it is raised on hotbeds and transplanted into the open garden, where it ripens its seeds, which are used as other legumes. It has also been brought to maturity in a stove in England, and proved very prolific. (See *Hort. Trans.* vol. v. p. 372.)

1544. *Lupinus.* Said to be derived from *lupus*, a wolf, because this plant devours, as it were, all the fertility

10213 Herbaceous, Leaves pinnated equal, Head terminal 1-sided, Flowers oblique
10214 Herbaceous, Leaves pinnated equal silky, Spike peduncled ovate
10215 Herbaceous, Leaves pinnated unequal, Head solitary stalked, Pods hooked blunt shorter than calyx
10216 Herbaceous, Cauline leaves ternate: radical pinnate unequal trifid or simple
10217 Herbaceous, Leaves pinnated unequal, Pedunc. lateral longer than leaf, Heads leafless
10218 Shrubby, Leaves pinnated equal silky, Bractes as long as globose many-flowered head
10219 Shrubby, Leaves pinnated equal and ternate villous, Flowers spiked
10220 Shrubby, Leaves pinnated: floral ternate
10221 Shrubby, Leaves ternate unequal, Calyxes woolly lateral
10222 Shrubby, Leaves ternate linear-cuneate somewhat stalked, Calyxes campanulate, Branches spiny
10223 Shrubby, Petioles spiny, Leaves pinnated, Flowers axillary subsessile, Cal. inflated
10224 Shrubby spiny, Leaves simple

10225 Leaves in fours cuneate rounded, Stipules undivided, Stem nearly smooth

10226 Cal. altern. without appendage: upper lip emarginate; lower entire
10227 Cal. whorled without appendage: lower lip entire, Stem and leaves hairy
10228 Cal. altern. without appendage: upper lip entire; lower 3-toothed
10229 Cal. altern. with an appendage: upper lip entire; lower 3-toothed
10230 Cal. half-whorled with an appendage: upper lip bifid; lower about 3-toothed
10231 Cal. altern. with an appendage: upper lip 2-parted; lower 3-toothed
10232 Leaves digitate, Cal. whorled without append. Upper lip emarg.; lower bifid, Pods 2-seeded
10233 Cal. altern. with an appendage: upper lip half-bifid; lower obscurely 3-toothed
10234 Cal. whorled with an appendage: upper lip 2-parted; lower entire
10235 Cal. altern. with an appendage: upper lip 2-fid; lower entire, Leaflets linear-lanceolate flat
10236 Cal. altern. with an appendage: upper lip 2-fid; lower subtrifid, Leaflets linear channelled
10237 Cal. whorled with an appendage: upper lip 2-parted; lower 3-toothed
10238 Cal. half-whorled with an appendage: upper lip 2-fid; lower undivided, Leaves simple obl. villous
10239 Shrubby, Cal. whorled without appendage stalked: lips acute entire

10240 Teeth of calyx 4 blunt, one acuminate
β Leaflets emarginate, Calyxes hoary
10241 Smoothish, Leaves on short stalks blunt at each end, Spikes solitary short, Pods 1-seeded
10242 Leaves on short stalks without a point obtuse smooth, Spikes long panicled downy
10243 Hoary, Leaflets subsessile ovate-elliptical acute mucronate, Spikes panicled hoary
10244 Said to be the same as A. microphylla
10245 Ferruginous, Spikes simple clustered, Leaflets ovate-lanceolate downy mucronate

10246 The only species

10247 Raceme solitary shorter than leaves, Pedunc. 2, Bractes less than cal. spreading, Pods pendulous
10248 Raceme solitary length of leaves, Pedunc. 2, Bractes less than cal. appressed, Pods pendulous
10249 Pods scymetar-shaped somewhat lunate smooth
10250 Vexillum of flowers revolute, Calyxes whole colored
10251 Peduncles subcapitate, Seeds 4-cornered cylindrical powdery
10252 Peduncles thicker than petiole capitate, Wings subfalcate deformed, Pods linear straight
10253 Flowers capitate, Cal. bracteate, Vexill. short, Wings expanded very large, Leaflets deltoid oblong

and Miscellaneous Particulars.

of the soil: but this is a very doubtful explanation. The species are border flowers, in much esteem for their velvet-like leaves and fine large flowers. They are vigorous growing plants, and most of them would afford the agriculturist a considerable bulk of herbage.

L. albus is supposed to be the species that was cultivated for this purpose by the Romans; though L. luteus is what is at present grown in the fields in the south of Italy as human food. In the south of France, it is grown in poor dry extensive plains, as a meliorating crop to be ploughed in where no manure is to be had, and the ground is too sterile for clover or other better plants. (*Villars.*) The perennial and ligneous species may be increased by pieces of the root, but they all seed freely.

1545. *Amorpha.* From α, privative, and μορφη, form, in allusion to the deformity of the corolla, which has neither alæ or carina. A. fruticosa was once used in Carolina as an indigo plant, but is now neglected. All the species are of easy cultivation, and increase by seeds or cuttings in sand.

1546. *Abrus.* From αβρος, elegant. The roots are used in the West Indies similarly to those of our liquorice, and the seeds are strung and worn as beads for ornaments, and also as rosaries, whence the specific name *precatorius.* They are frequently thrown, with other West Indian seeds, on the north-west coast of Scotland. Linnæus affirms, that they are very deleterious; but they are eaten in Egypt, though the hardest and most indigestible of the pulse tribe. In our stoves the plant requires a good deal of room and heat in order to flower freely. It is generally raised from seed, but cuttings will root in sand plunged in heat.

1547. *Phaseolus.* From *phaselus*, a little boat, which the pods may easily be supposed to resemble. P. vulgaris and multiflorus, *Haricot*, Fr., *Schminkbohne*, Ger., *Faginolo*, Ital., are well known culinary legumes. The dwarf kidney bean is earlier than the other, and better adapted for forcing; but much the largest crop

History, Use, Propagation, Culture,

is produced by the twining species. Neither sorts can be safely planted in the open air before the end of April, or first week of May, and the leaves are blackened by the first frosts of autumn. But in a stove or pit, green pods of the dwarf kinds may be gathered all the winter, and with this advantage over forced productions of the fruit kind required to be ripened, that the pods are as good from plants in the stove in midwinter, as from those in the open garden in midsummer. The garden culture of both species is so easy and universally known, that we shall not occupy ourselves with details. Though in this country the green pods only are used, on the continent the ripened seeds are as much the object of culture. In Holland, the twiner is grown in every cottage garden for both purposes; and in France and Switzerland, it is grown chiefly for the ripened seeds: in the latter countries it grows on very poor dry soil. On the first blackening of the leaves with frost, the plants are pulled up, dried like tobacco leaves under the dripping eaves of the houses; and in winter threshed out for the seeds, to be boiled and eaten with cream or butter, stewed in haricots, or put in soups. According to the analysis of Einhoff, 3840 parts of kidney bean afforded 1805 parts of matter analogous to starch, 857 of vegeto-animal matter, and 799 parts of mucillage: from which is to be inferred, that it is the most nourishing of all the legumes.

The perennial stove species thrive best in a light rich soil, and may be propagated readily from cuttings or from seed. P. caracalla, or Snail-flower, is a very curious species, and will grow and flower freely, if kept clear from the red spiders. This species was so named by the Portuguese, who first brought it from South America, in consequence of its hooded flower. Caracalla (from the Celtic words *car*, a head, and *cal*, a covering) was the name of a hooded dress much worn by the Gauls, and gave his nickname to the Emperor Marcus Aurelius Antoninus, who was accustomed to wear the dress.

10254 Flowers spiked, Cal. without bractes, Wings expanded larger, Leaflets ovate
10255 Flowers loosely spiked, Wings the length of vexillum
10256 Vexillum and keel spirally twisted together
10257 Stem hairy, Lateral leaflets 3-lobed : terminal 5-parted, Segm. lanceol. Peduncles 3-fl. shorter than petiole
10258 Stem smooth, Lateral leafl. 2-lobed ; terminal 3-lobed : segments ovate, Pedunc. 3-fl. longer than petiole
10259 Stem smooth, Leafl. blunt : lateral sinuose ; terminal hastate 3-lobed, Peduncles longer than leaf spiked
10260 Stem smooth, Bractes larger than calyx, Pods pendulous compressed rugose
10261 Stem round, Flowers capitate, Pods cylindrical horizontal
10262 Stem angular hispid, Pods pendulous hairy
10263 Stem flexuose round hairy, Pods capitate hairy
10264 Downy, Lower leaves rhomboid oval : upper 3-lobed, Heads on long stalks, Pods round subulate

10265 Leaflets oblong acuminate, Peduncles elongated, Pods round subulate
10266 Leaflets about 3-lobed, Lobes acuminate, Racemes axillary

10267 Leaflets ovate-lanceolate downy

10268 Leaflets ternate smooth, Flowers in heads, Calyxes hairy campanulate
10269 Flowers imbricated

10270 Pods ovate acinaciform, Seeds ovate with a hilum curved towards one end
10271 Pods pendulous cylindrical torulose, Peduncles erect many-flowered
10272 Pods capitate many cylindrical, Seeds rounded
10273 Pods capitate subcylindrical with a recurved concave end
10274 Pods capitate few cylindrical with a mucronate straight point
10275 Pods racemose ensiform with 3 keels at back straight at point, Seeds with an arillus
10276 Pods membranous quadrangular
10277 Pods subcylindrical smooth very long
10278 Pods racemose compressed hairy, Outer leaflets 2-lobed
10279 Pods subracemose linear hairy, Leaflets ovate-lanceolate downy
10280 Pods racemose compressed 4-seeded, Leaflets rhomboid
10281 Pods racemose acinaciform 4-seeded, Leaflets rhomboid smooth
10282 Leaves ovate downy, Flowers solitary, Seeds 2-horned
10283 Leaves ovate acute rugose netted villous, Racemes few-flowered
10284 Leaves smooth toothed with many angles
10285 Stem smooth, Petioles downy, Wings of corolla spreading
10286 Peduncles capitate, Pods straight linear
10287 Flowers somewhat spiked, Pods subcylindrical smooth, Leaves roundish rhomboid blunt entire smooth
10288 Pods acinaciform with 3 keels
10289 Racemes axillary erect, Pods pendulous hispid about 2-seeded
10290 Pods twin linear nearly erect
10291 Stem smooth, Peduncles 2-flowered, Outer leaflets somewhat angular
10292 Stem creeping, Leaflets roundish shining, Fl. racemose, Pods with 3 keels at back

10293 Pods racemose hairy equal, Seeds surrounded by the hilum, Leaves smooth on each side
10294 Pods racemose with transverse lamellæ hairy, Seeds surrounded by the hilum
10295 Pods racemose : valves keeled hairy, Peduncles in threes

and Miscellaneous Particulars.

1548. *Teramnus.* So called by Browne, apparently in allusion to its delicately-shaped legume, τεραμνοτης being used particularly to express the tenderness of eatable pulse ; ατεραμνος was a weed hostile to leguminous plants.

1549. *Carpopogon.* From καρπος, fruit, and πωγων, a beard ; the pods being bearded. Rapid growing climbers of the easiest culture.

1550. *Dolichos.* A name under which Dioscorides describes a plant supposed to have been the kidney bean of the moderns. The species are climbers, some of them to the height of the highest trees. The pods of most of them are eatable, but far inferior to the kidney bean. Some of them have tuberous roots which may be eaten. The seeds of D. Soja (*Sooju*, Jap.), which are usually called *Miso* in Japan, are put into soups, and are the most common dish there, insomuch that the Japonese frequently eat them three times a day. The Soja of the Japonese, which is preferred to the Kitjap of the Chinese, is prepared from these seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favorite dish made of these seeds, called *Teu hu* or *Tau hu*, which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome. (*Thunb.* and *Loureiro.*)

The perennial kinds are easily increased by cuttings, and all the species seed freely. D. purpureus and lignosus have the handsomest flowers, but none of them can be considered of much beauty.

1551. *Stizolobium.* From στιζω, to prick, and λοβος, a pod. S. urens and pruriens produce on the outside of their pods the irritating substance used in medicine as a vermifuge, under the name of Cowhage. The species are twining shrubs of the West Indies, with long bunches of yellow scentless flowers. The seeds of S. urens are often seen in cabinets of curiosities : many qualities are attributed to them by the superstitious Creoles. The French settlers call them *Yeux bourrique*, asses' eyes. S. pruriens is considered a powerful diuretic.

History, Use, Propagation, Culture,

1552. *Glycine.* From γλυκυς, sweet. G. monoica perfects its seeds under ground like Arachis hypogæa, Trifolium subterraneum, and Lathyrus subterraneus. They are all of easy culture, like their preceding and following allies. G. frutescens, and especially G. sinensis, are most beautiful hardy climbing shrubs, with long pendulous branches of blue flowers, like the Laburnum.

1553. *Kennedia.* Named after Mr. Kennedy, a nurseryman of celebrity in the vicinity of London. Handsome conservatory climbers of the easiest culture.

1554. *Cylista.* From κυλιξ, a calyx, that of the species so called being very large.

1555. *Galactia.* From γαλα, milk; the plant is milky in all its parts. A pretty flowering climber of easy culture in the soil indicated, and increased by cuttings in sand under a bell-glass.

1556. *Clitoria.* A name derived from an anatomical term, a resemblance to the subject of which has been fancied to exist in the flower. C. Ternatea was first brought to Europe from Ternate, one of the Molucca islands, which induced Tournefort to adopt Ternatea as a generic appellation, and it was continued by Linnæus as a specific one.

10296 Leaves ternate ovate smooth, Racemes filiform about 3-fl. Flowers apetalous, Pods oblong 2-seeded
10297 Leaves ternate ovate smooth, Stem hairy, Racemes pendulous, Fls. of stem with cor. of root apetalous
10298 Leaves ternate, Leaflets linear lanceolate silky, Fl. axillary solitary, Pods 2-seeded
10299 Leaves ternate, Leafl. oval hairy beneath, Pods subsolitary linear many-seeded, Style persistent straight
10300 Leaves ternate hairy, Racemes lateral
10301 Leaves ternate tomentose, Racemes axillary very short, Pods 2-seeded
10302 Downy, Leaves simple reniform rounded rugose netted, Racemes few-flowered
10303 Leaves ternate ovate acute hairy viscid, Peduncles jointed 1-2-fl. Pods oblong
10304 Leaves tern. ovate rhomboid pubesc. beneath netted tomentose, Racemes axillary, Pods subpubescent
10305 Leaves ternate ovate rhomboid beneath dotted with resin, Racemes longer than leaf
10306 Leaves ternate, Flowers racemose, Pods tumid villous
10307 Leaves ternate ovate somewhat hairy, Racemes axillary, Pods linear hooked at end
10308 Leaves simple sagittate, Petioles winged, Stem twining shrubby
10309 Leaves tern. roundish rhomboid smooth beneath dotted with resin, Racemes 1-sided longer than leaf
10310 Leaves pinnate, Leaflets 5 oblong apiculate, Flowers 3 axillary
10311 Leaves ternate villous beneath, Racemes terminal
10312 Leaves pinnated, Leaflets 11 ovate lanceolate silky, Raceme terminal nodding lax many-flowered
10313 Root tuberous, Lvs. pinn. Leafl. 5-7 ov. lanc. narrowed towards the end, Spikes dense shorter than leaves
10314 Leaves pinnated, Leaflets 9 ovate downy, Racemes dense terminal with bracteæ, Pods coriaceous

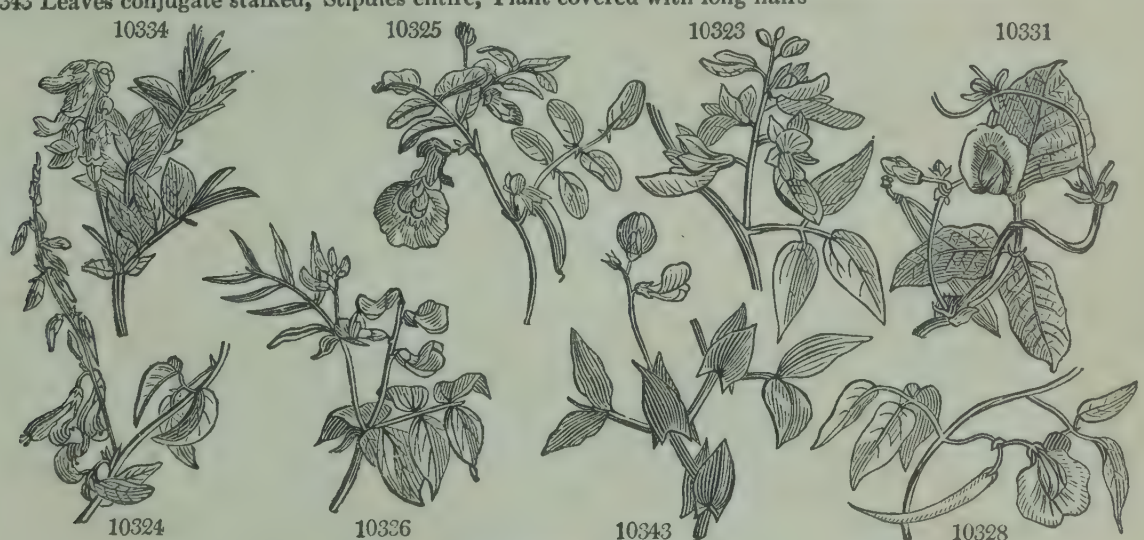
10315 Leaves ternate, Leaflets ovate, Pedunc. about 3-fl. Pods very hairy
10316 Leaves ternate, Leaflets obovate, Flowers capitate, Pods smoothish
10317 Leaves ternate, Leaflets obovate villous, Pedunc. 1-2-fl. Keel longer than obl. wings, Stem prostrate
10318 Leaves ternate, Leaflets ovate retuse netted, Racemes erect many-flowered
10319 Leaves simple smooth netted subcordate at base, Flowers racemose
10320 Leaves simple ovate, Racemes axillary few-flowered

10321 Cal. membranous, Upper segment bifid
10322 Down rusty, Cal. half 5-fid, Bractes ovate acuminate, Cor. larger than cal.
10323 Cal. scarious, Upper segment emarginate

10324 Leaves ternate, Raceme erect, Flowers pendulous

10325 Leaves quinate pinnate, Peduncles axilliary 1-flowered
10326 Leaves pinnate, Leaflets 5 round lanceolate or linear
10327 Leaves ternate, Calyxes solitary campanulate
10328 Leaves ternate, Calyxes twin campanulate
10329 Leaves ternate, Calyxes cylindrical
10330 Leaves ternate, Peduncles many-flowered, Ovary downy, Style villous
10331 Leaves ternate, Leaflets ovate-oblong acuminate, Cal. campanulate shorter than ovate bractes
10332 Leaves ternate, Leaflets mucronate glaucous beneath hairy, Cal. cylind. much larger than bractes

10333 Leaves conjugate subsessile, Stipules toothed
10334 Leaves pinnate in 4 or 5 pairs obl. glaucous beneath, Stipules half sagittate toothed at base
10335 Leaves of 2 pairs linear subulate approximating, Stip. half-sagittate subulate 1-toothed at base
10336 Leaves pinnate in 3 pairs ovate acuminate, Stipules half-sagittate entire, Stem simple
10337 Leaves pinnate in 3 or 4 pairs lanceolate, Stipules half-sagittate entire, Stem winged
10338 Leaves of 2 pairs linear-subulate downy, Stip. half-sagittate subulate nearly entire, Stem simple downy
10339 Stem branched, Leaves in 2 pairs linear, Stipules half sagittate subulate
10340 Leaves in 2 pairs ensiform stalked, Stipules simple, Stem simple
10341 Leaves in 4 pairs lin. lanc. Stipules half-sagittate entire, Stem winged branched upwards
10342 Leaves of 2 pairs lin-lanc. mucronate stalked nerved, Stipules half-sagittate toothed at base
10343 Leaves conjugate stalked, Stipules entire, Plant covered with long hairs



and Miscellaneous Particulars.

1557. *Orobus.* From ορω, to excite, and βυς, an ox; that is to say, a food nourishing to cattle. Handsome plants, and free flowerers. O. luteus Haller considers as one of the handsomest of the papilionaceous tribe. O. tuberosus, according to Lightfoot, is in great esteem among the Highlanders of Scotland for the tubercles of the root; they dry and chew them in general to give a better relish to their liquor; they also affirm them to be good against most disorders of the thorax, and that by the use of them they are enabled to repel hunger and thirst for a long time. In Breadalbane and Ross-shire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavored and nutritive, and in times of scarcity have served as a substitute for bread. (*Lightfoot.*)

Boiled well, a fork will pass through them, and dried slightly and roasted, they are served up in Holland and Flanders in the manner of chesnuts, which they resemble in flavor. Dickson (*Hort. Trans.* ii. 359.) recommends cultivating them in a bed or border of light rich soil, paved at the depth of twenty inches, to prevent their roots from running down. Plant the tubers six inches apart, and three inches below the surface;

History, Use, Propagation, Culture,

the second year some will be fit to gather, and by taking only the largest, the bed will continue productive for several years, adding some fresh compost every year.

1558. *Lathyrus.* A name employed by Theophrastus to designate a leguminous plant. It is said by his commentator Bodæus a Stapel, to have been derived from λα, an augmentative particle, and θουρος, any thing which is exciting; and to have been applied to this plant in consequence of certain aphrodisiacal qualities ascribed to it. L. sativus, *Gesse*, Fr., is frequently sown in Switzerland for soiling horses. In several parts of the continent, a white light pleasant bread is made from the flour of this pulse, but it produced such dreadful effects in the last century, that the use of it was forbid by an edict of George, Duke of Wurtemburg, in 1671; and this not being observed, was enforced by two other edicts under his successor Leopold, in 1705, and 1714

Mixed with wheat flour in half the quantity, it makes a very good bread, that appears to be harmless. But bread made with this flour only has brought on a most surprising rigidity of the limbs in those who have used it for a continuance; insomuch that the exterior muscles could not by any means be reduced, or have their natural action restored. These symptoms usually appeared on a sudden, without any previous pain; but sometimes they were preceded by a weakness and disagreeable sensation about the knees. Baths, both hot and cold, fomentations and ointments of various kinds have been tried without effect; insomuch that it is regarded as incurable, and being neither very painful nor fatal, those who are seized with it usually submit to it with patience.

Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb, was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected. Pigeons, especially young ones, lose the power of walking by feeding on the seed. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland, cattle feed on the herb without any harm. It would be worth enquiring, therefore, whether the soil may not contribute something to the ill qualities of the plant: and it is remarked that the seed from a strong, fat, moist soil, is much more deleterious than from a light dry one. (*Duvernoy.*)

Fabbroni, from Florence, in 1786, says, that the government there has cautioned the peasants against the

10344 Leaves in 2 pairs ensiform, Stipules subulate, Stem simple
10345 Stem branched, Leaves in 6 pairs ovate oblong
10346 Stem branched, Leaves in 2 pairs lanceolate nerved, Stipules somewhat spiny
10347 Leaves pinnate hairy of many pairs ovate lanc. Stip half-sagitt. Stem branched decumbent hairy
10348 Leaves pinnate smooth of many pairs elliptical, Stipules ovate lanceol. Stem branched erect hairy

10349 Peduncles 1-flowered, Tendrils leafless, Stipules sagittate cordate
10350 Peduncles many-flowered, Leaves simple, Stipules subulate
10351 Peduncles 1-flowered longer than calyx, Tendrils 2-leaved simple
10352 Peduncles 1-flowered, Tendrils 2-leaved, Pods ovate compressed channelled at back
10353 Peduncles 1-flowered, Tendrils 2-leaved and 4-leaved, Pods ovate compressed with 2 edges at back
10354 Peduncles 1-flowered shorter than calyx, Tendrils 2-leaved simple, Leaflets lanceolate
10355 Peduncles 1-flowered, Tendrils 2-leaved, Leaflets setaceous linear
10356 Peduncles 1-flowered as long as cal. Petioles 2-leaved, Leaflets lanc. Pods linear roughish mucronate
10357 Peduncles 1-flowered awned, Tendrils 2-leaved simple ensiform
10358 Peduncles 1-flowered awned, Tendrils 2-leaved simple, Leaflets linear
10359 Peduncles 1-flowered, Tendrils 4-leaved, Petioles winged, Pods compressed
10360 Peduncles 1-flowered awned, Tendrils many-leaved, Leaflets linear truncate mucronate
10361 Peduncles about 1-fl. Tendrils many-leaved, Leaflets alternate lanceolate, Petioles winged
10362 Peduncles 2-flowered, Tendrils 2-leaved, Leaflets ovate oblong, Pods hairy
10363 Peduncles 2-flowered naked, Tendrils 2-leaved, Leaflets obovate wavy, Stems rigid 4-angled
10364 Peduncles 2-flowered, Tendrils 2-leaved, Leaflets ensiform, Pods smooth, Stipules 2-parted
10365 Peduncles 2-flowered, Tendrils 2-leaved, Leaflets altern. lanc. smooth, Stipules lunate
10366 Peduncles 2-flowered, Tendrils many-leaved, Leaflets lanceolate, Stipules toothed
10367 Peduncles about 3-flowered, Tendrils many-leaved, Leaves lanc. Pods hairy, Seeds rough
10368 Peduncles long many-fl. Stipules broad cordate sagittate, Tendrils 2-leaved
10369 Pedunc. many-fl. Tendrils 2-leaved, Leaflets oval, Joints naked
10370 Pedunc. 1-fl. shorter than stipules, Tendrils 2-4-leaved, Stip. toothed, Pods erect turgid and villous
10371 Pedunc. many-fl. Tendrils 2-leaved, Leaflets roundish, Joints membranous
10372 Pedunc. many-fl. Tendrils 2-leaved quite simple, Leaflets lanceolate
10373 Pedunc. many-fl. Tendrils 2-leaved, Leaflets ensiform, Joints membranous
10374 Pedunc. many-fl. Tendrils 2-leaved, Leaflets lanceolate, Joints membranous
10375 Pedunc. many-fl. Tendrils 2-leaved and 4-leaved, Leaflets lanc. Joints membranous
10376 Pedunc. many-fl. Tendrils many-leaved, Leaflets linear lanc. acute
10377 Pedunc. many-fl. Tendrils many-leaved, Leafl. lanc. obl. blunt mucronate, Joints membran. Pods curved
10378 Pedunc. many-fl. Tendrils many-leaved, Leafl. ellipt. blunt, Stipules half-sagitt. ovate broader than leaflet

10379 Petioles decurrent membranous 2-leaved, Peduncles 1-flowered

10380 Petioles round, Stipules rounded below crenate, Peduncles many-flowered

and Miscellaneous Particulars.

use of Lathyrus sativus; swine having lost the use of their limbs, and become pitiable monsters by being fed on this pulse exclusively. The peasants, however, eat it boiled, or mixed with wheat flour, in the quantity of one-fourth, without any harm.

The poisonous Lathyrus from Barbary, is L. semine punctato of Casp. Bauhin, and seems to be only a variety; for in the crops of L. sativus in Italy, they find black seeds striped with white, as in the African seed. Fabbroni suspects it to be a mule between L. sativus and Cicera, for the flower and seed partake of the characters of both; having a black seed marked with white; and a white banner with a red keel to the corolla. (*Fabbroni's Letters in* MSS. *Banks.*)

L. odoratus is one of our most esteemed border annuals, and is extensively grown in pots for decorating chambers and windows. L. tingitanus, articulatus, and annuus are also sown as border annuals.

L. tuberosus produces tubers on the roots, like those of the earth nut (Bunium bulbocastanum); these are sold in the markets of Holland, like those of Orobus tuberosus and Trapa natans, and their flavor is highly esteemed.

L. latifolius is a very shewy plant for shrubberies, arbors, and trellis work, and yields a great quantity both of green fodder and seeds, which some botanists have suggested might be applied to agricultural purposes.

1559. *Ochrus; ὀχρος*, yellow, in allusion to the color of its flowers. A small annual plant with yellow flowers, native of hedges in the south of Europe.

1560. *Pisum.* From the Celtic *pis*, a pea. P. sativum, *Pois*, Fr., *Erbse*, Ger., and *Pisello*, Ital., is the most valuable of culinary legumes. Like most domestic plants of great antiquity, its native country is unknown, though it is commonly referred to the south of Europe. The varieties of the pea are numerous, and differ widely among themselves from the early frame, a low plant bearing only one white blossom on each footstalk, to the crown-bearing, having pink blossoms on a terminating corymb. The rouncival grows ten or twelve feet high, and the imperial not two feet. The sugar-pea has pods in which the inner film is wanting, or much less tough than usual, which admits of boiling the pods entire, and eating them in the same manner as kidney beans.

In the open garden, the pea is sown at intervals from January to the middle of July, and a succession of

History, Use, Propagation, Culture,

crops is thus obtained from the end of May to the beginning of November. By raising in hotbeds and transplanting, the first crop may be gathered in the beginning of May; and by raising and maturing in pits, pease may be gathered in April. The pea, however, does not force well, and requires extraordinary attention to giving air, otherwise the blossoms will not set. The culture of the pea is known to every countryman.

The grey pea, cultivated in agriculture, is by some considered as a species, though it is obviously a mere variety, not further removed from the frame pea than is the blue Prussian, or the crown pea. A dry soil and season is essential for a good crop, unless the plants can be supported by sticks like the garden crops. The seed is chiefly used for feeding pigs, and splitting for soup. In boiling split pease, some samples, without reference to variety, fall or moulder down freely into pulp, while others continue to maintain their form. The former are called boilers. This property of boiling depends on the soil; stiff land, or sandy land that has been limed or marled, uniformly produces pease that will not melt in boiling, no matter what the variety may be. Pease straw cut green and dried, is reckoned as nourishing as hay, and is considered as excellent for sheep. The produce of pease in flour is as three to two of the bulk in grain, and husked and split for soups as four to two. A thousand parts of pea flour afforded Sir H. Davy 574 parts of nutritive or soluble matter; viz. 501 of mucilage, or vegetable animal matter, 22 of sugar, 35 of gluten, and 16 of extract, or matter rendered insoluble during the operation.

P. maritimum has seeds of a bitterish disagreeable taste, but are reported nevertheless to have been eaten in times of scarcity. (*Turner's Herbal.*)

1561. *Vicia.* From *gwig*, Celtic; whence βιζιον, Greek, *vicia*, Latin, *vesce*, French, *vetch*, English, &c. V. sylvatica and cracca, where they occur in meadows, are considered valuable herbage plants. They yield great bulk of fodder, which is allowed to be very nutritive. Some have proposed to cultivate them alone, but Curtis observes, they would probably in that case choke themselves for want of support.

V. sativa, the winter and summer tare, fetch or vetch, is a valuable agricultural plant. Some consider the winter variety as a distinct species; but Professor Martyn proved, by cultivating both, that they were not

10381 Petioles 4-leaved, Stipules crenate, Peduncles 1-flowered

10383 Peduncles many-fl. Petioles many-leaved, Leaflets ovate: lower sessile
10384 Peduncles many-fl. Leaflets reflexed ovate mucronate, Stipules somewhat toothed
10385 Peduncles many-fl. longer than leaf, Leaflets ellipt. Stipules lunate with setaceous teeth
10386 Peduncles many-fl. shorter than leaf, Leaflets oblong subpubesc. Stipules half sagittate entire lanceolate
10387 Peduncles many-fl. shorter than leaf, Teeth of calyx setaceous very villous, Leaflets lanceolate villous
10388 Peduncles many-fl. longer than leaf, Flowers imbricated, Leaflets obl. ovate villous, Stip. half-sagittate
10389 Peduncles many-fl. longer than leaf, Flowers imbricated, Leafl. lanc. blunt, Stip. half-sagitt. lin. subulate
10390 Peduncles many-fl. longer than leaf, Flowers imbricated, Leafl. lin. smoothish 3-nerved, Stip. lin. entire
10391 Peduncles many-fl. longer than leaf, Flowers distant, Leafl. lin. Stip. half-sagitt. lin. lanc. toothed at base
10392 Peduncles many-fl. Petioles suleate 12-leaved, Leaflets lanc. smooth, Stip. half-sagittate stalked
10393 Peduncles many-fl. Leaflets obl. Stipules entire, Pods villous ovate oblong
10394 Peduncles many-fl. Leaves entire, Stipules entire, Pods nearly erect
10395 Peduncles many-fl. long, Upper leaves subcirrhous, Stipules half-sagittate entire, Leafl. oval-obl. hoary
10396 Peduncles many-fl. long, Leaves not cirrhous, Leafl. obl. lanc. silky beneath, Stip. lanceol. entire
10397 Peduncles many-fl. shorter than leaf which is not cirrhous, Leaflets obovate emarginate, Stip. oblong
10398 Peduncles 2-flowered awned shorter than leaf, Leaflets linear narrowed at each end, Stip. half-sagittate
10399 Pods subsessile solitary, Leaflets ovate, Stipules marked 4-toothed
10400 Pods sessile sub-binate, Leaflets obl. ovate truncate mucronate, Stipules toothed marked

10401 Pods sessile sub-binate spreading, Lower leaflets ovate emarginate: upper lin. entire, Seeds globose
10402 Pods sessile: lower subterranean, Leaflets linear truncate, Stipules half-sagittate
10403 Pods sessile solitary erect smooth, Leaflets 6: lower subcordate
10404 Pods sessile solitary reflexed hairy, Stems diffuse, Stipules colored, Standard smooth
10405 Pods sessile solitary reflexed hairy 5-seeded, Standard villous
10406 Pods stalked reflexed, Standard silky, Stipules lanceolate marked, Upper leaflets obl. elliptical acute
10407 Pods sessile solitary reflexed smooth, Stems nearly erect, Leaves quite smooth
10408 Pods sessile solitary reflexed downy, Leaflets linear blunt, Stipules half-sagittate entire
10409 Pedunc. 1-fl. in fruit longer than leaf and awned, Leaflets linear blunt mucronate, Stipules multifid
10410 Pods stalked about 3, and the standard hairy, Stipules lanceolate marked
10411 Pods subsessile twin reflexed smooth, Leaflets obl. ovate retuse, Stipules marked
10412 Pedunc. 1-fl. very short, Leafl. lin. lanc. truncate, Stipules lanc. undivided, Pods finely downy
10413 Pods subsessile pendulous smooth 4-seeded, Leaflets linear emarginate
10414 Pedunc. 1-fl. awned, Leaflets lanceolate blunt, Stipules bifid
10415 Pods stalked about 4 erect, Leaflets ovate entire
10416 Pods stalked solitary erect, Leaflets 4 oval-lanceolate, Stipules toothed
10417 Pods subsessile solitary compressed somewhat inflated, Leaflets ovate toothed at end, Stip. cil. toothed
10418 Pods subsessile subternate compressed, Leaflets ovate entire, Stipules ciliate toothed at base
10419 Pods subsessile subternate, Leaves and stipules serrate
10420 Pods subsess. subtern. torulose, Leaflets ovate entire, Petioles not cirrhous, Stip. sagittate toothed at base

and Miscellaneous Particulars.

even very distinct varieties. The winter variety is sown in September and October, and the summer at different periods, from February to June, for successional cuttings. The soil requires to be in a good heart, otherwise they will produce but a poor crop of herbage: on a good soil they will yield ten or twelve tons, which is found excellent for milch cows and working stock. The crop is seldom left to ripen its seeds, but when seeds are wanted; the only use made of them being for sowing or feeding pigeons.

V. narbonensis and serratifolia are cultivated in Germany in the same manner as our tare. Vicia sepium has been recommended to be sown among clover for mowing.

V. Faba is a well known legume both of the garden and the field. The garden varieties are numerous; the earliest is a small seeded variety, the Mazagan, and the largest the Windsor. Beans are planted at the various times in which pease are sown; but the late sowings of this plant do not answer so well as those of the pea. When the ground is properly pulverised and in good heart, they succeed well when transplanted; and where a first crop is injured by insects, if the stems are cut down to the ground during their flowering season, they will send up a succession of shoots, which will bear a crop. In this way, according to some, the bean may be rendered perennial, as it is certain the scarlet kidney bean may by merely protecting the roots from the frost.

The field bean, of which there is a larger and smaller sort, the latter called *ticks*, is sown in drills by a machine, so as to admit of horse hoeing, and otherwise ploughing or stirring between the rows. By this means a larger crop is produced, and the land cleaned and brought into a better state for a succeeding corn crop. Beans are excellent food for hard working horses, and for fatting hogs for bacon. The flower of beans and pease is more nutritive than that of oats, but less easy of digestion. A bushel of beans is supposed to yield fourteen pounds more of flour than a bushel of oats, and a bushel of pease eighteen pounds more, or, according to some, twenty pounds. A thousand parts of bean flour were found, by Sir H. Davey, to yield 570 parts of nutritive matter, of which 426 were mucilage or starch, 103 gluten, and 41 extract, or matter rendered insoluble during the process.

History, Use, Propagation, Culture,

1562. *Ervum.* From *erw*, tilled land, in Celtic; to which this plant is a pest. E. lens (from *lentil*, Celtic), *Lentille*, Fr., *Lentze*, Ger., and *Lenticcia*, Ital., is a legume of the greatest antiquity, being in esteem in Esau's time, and much prized in eastern countries ever since. In Egypt and Syria they are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journies. There are three varieties of lentils cultivated in France and Germany; the small brown, which is the lightest flavored, and the best for haricots and soups; the yellowish, which is a little larger, and the next best; and the lentil of Provence, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grain as human food. A dry warm sandy soil is requisite for the lentil; it is sown rather later than the pea, at the rate of a bushel, or one and a half bushel, to the acre; in other respects its culture and harvesting are the same, and it ripens sooner. The produce of the lentil in grain is about a fourth less than that of the tare; and in straw it is not a third as much, the plants seldom growing above one and a half foot high. The straw is, however, very delicate and nourishing, and preferred for lambs and calves; and the grain, on the continent, sells at nearly double the price of pease. Einhoff obtained from 3840 parts of lentils, 1260 parts of starch, and 1433 of a matter analogous to animal matter.

1563. *Ervilia.* A word with the same meaning as *Ervum.* See that word.

1564. *Cicer.* All authors agree in deriving the name from κιζυς, force; on account of the eminent qualities the ancients attributed to it. It grows naturally in the South of Europe, and is cultivated there for the same purposes as the lentil, but it is too delicate for field culture in this country. It is called *Arietinum*, because the young seed bears a very curious resemblance to a ram's head.

1565. *Liparia.* From λιπαρος, brilliant, in allusion to the surface of the leaves. "The species," Sweet observes, "thrive very well in a mixture of loam and peat, and do not require so much water as some other genera of the order. L. villosa, vestita, sericea, and some others, if they get too much water over their leaves

10421 Pedunc. 2-fl. Seeds compressed, Leaflets entire
10422 Pedunc. about 2-fl. Pods smooth 4-seeded, Leaflets oblong truncate
10423 Pedunc. many-fl. Pods hairy 2-seeded, Leaflets lin. blunt
10424 Pedunc. 2-fl. awned, Pods smooth 2-seeded, Leaflets lin. lanceolate downy

10425 Pedunc. awned shorter than leaf, Leaflets obl. truncate smooth, Stipules hastate

10426 Pedunc. 1-fl. Seeds globose gibbous, Leaflets serrated

10427 Flowers capitate, Leaves lanceolate nerved smooth
10428 Flowers capitate: head erect, Leaves lanceolate smooth
10429 Flowers capitate, Leaves lanceolate downy
10430 Flowers capitate, Leaves ovate concave woolly beneath
10431 Flowers spiked hairy, Leaves lanceolate, and angular stem smooth
10432 Flowers fascicled, Leaves ovate villous downy
10433 Flowers racemose, Leaves obovate oblong smooth, Stem hairy
10434 Flowers somewhat spiked, Leaves ovate villous downy

10435 Racemes simple pendulous, Leaflets ovate oblong, Pods hairy
10436 Racemes simple pendulous, Leaflets ovate oblong rounded at base, Pods quite smooth
10437 Racemes lateral erect, Branches round spreading, Leaflets ovate downy
10438 Racemes terminal erect, Calyxes hairy: teeth minute, Leaflets ellipt. hairy
10439 Racemes terminal erect, Calyxes villous: segments falcate, Leafl. obovate oblong
10440 Racemes terminal erect, Calyxes and pods viscid, Leaflets oblong
10441 Racemes erect, Calyx with a triple bractea, Floral leaves sessile
10442 Racemes terminal 1-sided, Leaves pinnated hoary, Leaflets roundish elliptical
10443 Racemes axillary erect, Leaflets sublanceolate downy: the middle one in a long stalk
10444 Raceme term. 1-sided 4-fl. Leaflets obovate downy beneath, Calyxes deeply 3-parted
10445 Pedunc. aggregate subterminal, Calyxes hairy trifid, Leaflets obov. mucronate hairy beneath
10446 Flowers capitate, Branches straight round villous, Leaflets ovate ellipt. villous, Bract linear
10447 Fl. in term. umbels, Stems erect, Leaflets lanc. strigose pubescent
10448 Fl. umbelled term. Stems erect, Leaflets ellipt. smooth acute
10449 Fl. axillary solitary stalked, Stems procumbent, Leaflets obovate, Pods linear repand

10453 Flowers stalked axillary about 3, Calyxes campanulate, Leaflets obovate blunt hairy
10454 Flowers stalked lateral about 4, Stem erect, Branches long, Cal. tubular, Leaflets obovate
10455 Racemes term. erect, Leaflets obl. rhomboid blunt, Stipules rounded ovate oblique
10456 Flowers in lateral umbels, Stems erect, Leaves ellipt. erect silky beneath, Calyxes woolly
10457 Pedunc. about 3 term. Leaflets oblong lanceolate silky, Pods linear silky, Stems decumbent
10458 Flowers umbelled terminal, Cal. 3-parted: lower tooth trifid, Leaflets rounded obovate, Stems ascending

and Miscellaneous Particulars.

will be killed. Very young tops, taken off for cuttings, and planted under a bell-glass, in sand, are not difficult to root. (*Bot. Cult.* 217.)

1566. *Cytisus.* Pliny says it was so called because found in *Cythnus*, one of the Cyclades. The Cytisus of the ancients is believed to have been our Medicago arborea. A genus of ornamental trees and shrubs, of which the Laburnums, *Cytise des alpes*, Fr., *Bohnenbaum*, Ger., are well known and universally admired examples. There are two species of Laburnum, which are so much alike, that in most nurseries they are confounded together, or only one in cultivation. C. alpinus is the tree Laburnum, whose timber (the false ebony of the French) is much prized by cabinet-makers and turners, for its hardness, beauty of grain, and durability. The tree is frequently sown in plantations infested with hares and rabbits, who will touch no other tree as long as a twig of laburnum remains. "Though eaten to the ground in winter," as Boutcher observes, "it will spring again next season, and thus afford a constant supply for these animals, so as to save the other trees till of a size to resist their attacks. The timber has been sold for upwards of half a sovereign per foot." It becomes most valuable in light loams and sandy soils.

C. wolgaricus and purpureus are very handsome shrubs; and make a fine appearance when grafted on stocks of laburnum five or six feet in height.

C. cajan (an alteration of the Malay name, *Catjang*), *Pois d'Angola*, Fr., is frequently planted in the West India Islands, chiefly in rows as a fence to the sugar plantations, and will thrive on barren land. The seed is much eaten by poor people and negroes, and is esteemed a wholesome pulse. In the island of Martinico even the better sort of people hold it in estimation, and prefer it to the European pea. The chief use of it in Jamaica is for feeding pigeons, whence its name. The branches, with the ripe seed and leaves, are given to feed hogs, horses, and other cattle, which grow very fat on them. (*Sloane and Jacq. Obs.*)

History, Use, Propagation, Culture,

1567. *Mullera.* In honor of Otho Frederick Müller, a Dane, one of the editors of the Flora Danica. There have also lived four other Müllers, Germans, and botanists. The fruit is remarkable for its form, which is that of a necklace; a number of little balls being united by stalks, and not opening as in other leguminosæ, but always remaining closed. The flowers are pink, and the size of a bunch of Laburnum.

1568. *Robinia.* In memory of Jean Robin, herbarist to Henry IV. of France, author of Histoire des Plantes, &c., Paris, 1620. His son, Vespasian, was subdemonstrator at the Jardin de Roi, and was the first person who cultivated the R. pseudacacia in Europe.

R. pseudacacia is a thorny fast-growing tree, of middling stature, of no great beauty as a tree, but ornamental when young, and very well adapted for copse-wood and rough timber. The leaves come out late in spring, and fall off early in autumn, like those of the ash. The timber is much valued in North America, and said to be superior to that of the laburnum; "being close-grained, hard, and finely veined; and in America more valued by the cabinet-maker than any other native timber whatever. Pursh, in his Flora, asserts, that being nearly incorruptible, it is equally useful for posts and gates. We are informed by a friend, that gate-posts of this timber, on a property near Baltimore, have remained fresh for nearly a century. The finest pinnated leaves, and pendulous white odorous flowers, add greatly to its beauty. Its value is scarcely known in this country." (*Caled. Mem.* ii. 414.) It prefers a deep sandy soil, and rather sheltered situation; being very apt to throw up suckers from the running roots, and as it stoles freely, it seems peculiarly calculated for coppice-woods. Beatson (*Com. to Board of Agr.*) has cultivated it in this way to great advantage.

In North America the use of the locust-tree has hitherto been confined to trenails, on account of its scarcity, but were it as plentiful as oak, it would be applied for more purposes by the shipwright, such as knees, floor-timbers, and foot-hooks, being much superior to oak for its strength and duration, and, from the tree spreading into branches, affords full as large a proportion of crooks or compass timber as oak.

A cubic foot of acacia, in a dry state, weighs from 48 to 53 pounds avoirdupois. If we compare its toughness in an unseasoned condition with that of oak, it will not be more than 8—100 less. Its stiffness is equal to 99—100 of oak; and its strength nearly 96—100; but were it properly seasoned, it might, possibly, be found much superior to oak in strength, toughness, and stiffness. A piece of unseasoned acacia, two feet six inches long, and an inch square in the vertical section, broke when loaded with a weight of 247 pounds avoirdupois. Its medium cohesive force is about 11,500 pounds. (*Dict. of Archi.*)

10459 The only species

10460 Racemes with 1-fl. pedicels, Leaves pinnated with an odd one, Stipules spiny, Pods smooth

10461 Racemes with 1-fl. pedicels, Leaves pinnated with an odd one, Branches and pods viscid with glands
10462 Racemes with 2-fl. pedicels, Cal. truncate, Leaves pinnated with an odd one, Stem unarmed
10463 Petioles somewhat spiny, Leaflets lanceolate mucronate downy, Pedic. 1-flowered
10464 Racemes axillary few-flowered, Calyxes and branchlets finely bristly
10465 Racemes axillary, Leaves pinnate with an odd one, Stem hispid

10466 Pedunc. simple several, Leaves in 4 pairs, Petioles unarmed, Pods cylindrical

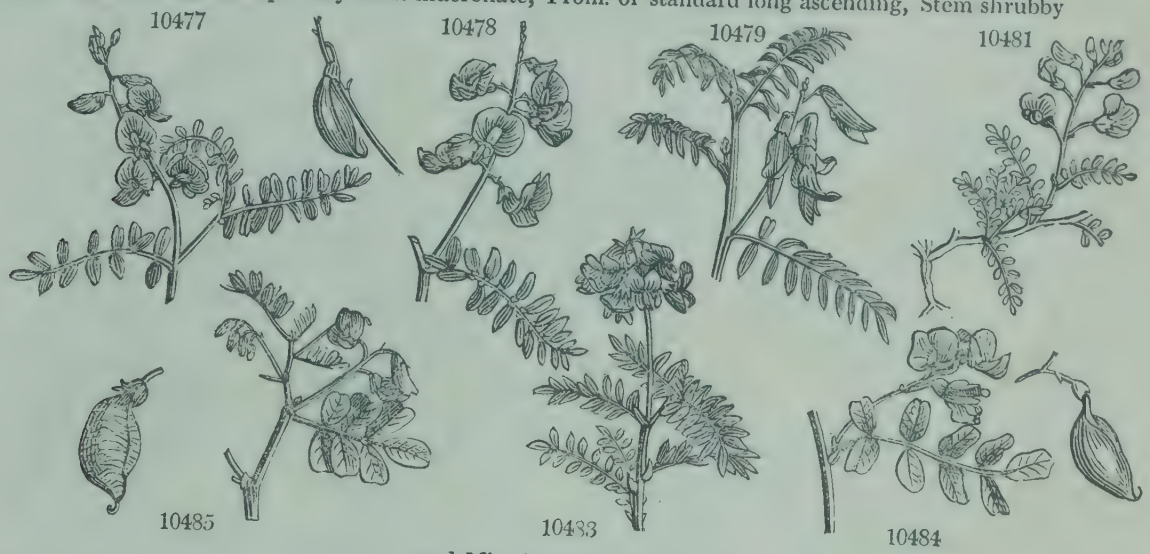
10467 Leaves about 4 pair; leaflets obcordate, Peduncles twin shorter than flower
10468 Pedunc. simple, Leaves 4 stalked hoary terminated by a weak spine, Pods downy
10469 Pedunc. simple solitary, Leaves in about 8 pairs, Stipules spiny, Pods compressed
10470 Pedunc. simple, Leaves in many pairs downy, Petioles filiform spiny, Branches villous
10471 Pedunc. simple, Leaves in 2 pairs, Leafl. obl. lanc. silky, Stipules and petioles spiny
10472 Pedunc. simple, Leaves in 4 pairs, Leafl. cuneate smooth, Stipules and petioles spiny
10473 Pedunc. 3-fl. Leaves in 2 pairs silky, Petioles spiny persistent, Pods bladdery
10474 Pedunc. simple, Leaves in 2 pairs, Leaflets obovate shining, Stipules and petioles spiny
10475 Pedunc. simple, Leaves about 4 somewhat petiolated terminated by a weak spine
10476 Pedunc. simple, Leaves 4 sessile

10477 Stalk of pod longer than persistent filaments
10478 Stalk of pod shorter than persistent filaments

10479 Leaflets obl. blunt hoary beneath, Stem shrubby, Branches silky with down

10480 Leaflets linear emarginate smooth, Stem weak, Raceme axillary
10481 Leaflets linear emarginate hairy, Cal. without bractes with black hairs
10482 Leafl. obl. downy, Stem erect, Racemes terminal
10483 Leaflets in 7 pairs ovate acute smoothish, Racemes axillary subcapitate 1-sided

10484 Leaflets ellipt. retuse, Prominences of the standard short
10485 Leaflets obcordate glaucous, Pedunc. about 6-flowered, Pods closed at end
10486 Leafl. obovate emarginate glauc. Prom. of standard blunt very small, Pods open at end
10487 Leafl. roundish ellipt. very blunt mucronate, Prom. of standard long ascending, Stem shrubby



and Miscellaneous Particulars.

R. hispida is a very handsome shrub, but it requires a sheltered situation, otherwise the branches are very liable to be shattered or blown off by high winds. In young trees grafted above ground, the fracture commonly takes place at the graft, so that a good preventative is to graft on the root a little below the surface. Grafts in this manner are also much more certain of success.

R. viscosa resembles, in its leaves and flowers, the common acacia; but is, altogether, a much handsomer tree.

1569. *Caragana.* This genus has been confounded by Linnæus and his followers with Robinia. The name is derived from the appellation of the most common species in Tartary, where it is called among the Moguls, *Carachaná.* Altagana, the name of another species, is in like manner a slight alteration of the Tartar name Aldachaná.

C. spinosa, on account of the length and toughness of the branches, and its large stout thorns, is admirably adapted to form impenetrable hedges, and is sufficiently hardy to bear our climate. About Pekin, they stick the bushes in clay on the tops of their walls, to prevent persons from getting or looking over them. (*Pallas.*)

C. Halodendron is a handsome shrub, and grows in Siberia on dry naked salt-fields, and it is probably from the want of this principle in our garden soils, that it so seldom flowers here.

C. pygmæa is a weak low shrub, with a shining yellow bark, with wood of a deep bay, almost as hard as horn.

C. frutescens is used by the Tartars for the same purposes as osiers, for which its tough shoots render it proper.

C. jubata is remrakable plant, its shoots always remaining covered by the persistent brown stipulæ of the fallen leaves. It is extremely difficult to propagate, and is rarely even seen in this country. The most successful cultivators of it are Messrs. Loddiges and Son.

1570. *Swainsonia.* Named after the late Mr. Isaac Swainson, who had a botanic garden at Twickenham.

1571. *Sutherlandia.* In honor of Mr. James Sutherland, who published, in 1683, an 8vo. catalogue of the Physic Garden at Edinburgh. This and the former genus seed freely, and may also be readily increased by cuttings.

1572. *Lessertia.* Named by Decandolle in honor of M. Stephen Delessert, to whose mother Rousseau's Letters on Botany were addressed.

1573. *Colutea.* An ancient name of a bush with sweet-scented flowers; probably similar to the genus now

History, Use, Propagation, Culture,

so called. Shrubs with membranaceous inflated pods, free-growers and flowerers, well adapted to introduce in extensive shrubberies.

C. arborescens grows on Mount Vesuvius, even in the ascent to the crater, where there are scarcely any other plants. The leaves are recommended as answering all the purposes of senna, and Allioni has given particular directions for the preparation of them. A larger dose seems to be required to produce the same effect. The seeds, in a quantity of a drachm or two, excite vomiting. It is said by Haller and Ray to afford food grateful to cattle.

1574. *Glycyrrhiza.* From γλυκυς, sweet, and ῥιζα, a root; the sweet taste of the liquorice root is well known. But the species from which the name is derived now constitutes a different genus. See Liquiritia.

1575. *Liquoritia.* A Latinized appearance of our common English word *Liquorice*, which in its turn is said to be an alteration or corruption of the French word *Reglisse*, itself a corruption of *Glycyrrhiza*. So, at least, says De Theis. To others, however, it is appears more probable that the name alludes to the quantity of *liquor* or *liquid* which the roots contain, and which constitutes their great value.

L. officinalis is a deep-rooting perennial, which has long been much cultivated in Spain; and since Elizabeth's time has been grown in different parts of England. The soil should be a deep sandy loam, trenched by the spade or plough, or with the aid of both, to two and a half or three feet in depth, and manured, if necessary. The plants are procured from old plantations, and consist of the side-roots, which have eyes or buds. These may be taken off, either in autumn, when a crop of liquorice is taken up for use, and laid in earth till spring; or taken from a growing plantation, as wanted for planting. The planting season may be either October, or February and March. In general the latter is preferred. The plants are dibbled in, in rows three feet apart, and from eighteen inches to two feet in the row, according to the richness of the soil. The after-culture consists in horse-hoeing and deep stirring, in weeding, and in cutting over and carrying away the haulm every autumn, after it is completely withered. As the plants do not rise above a foot the first season, a crop of onions or beans is sometimes taken in the intervals. The plants must have three summers' growth, at the

10503 Leaflets 15 cuneate retuse, Pods rounded erect 5 together
10504 Leaflets several obl. cuneate, Pods compressed ensiform
10505 Leaflets 9 very blunt somewhat emarginate, Stipules round toothletted

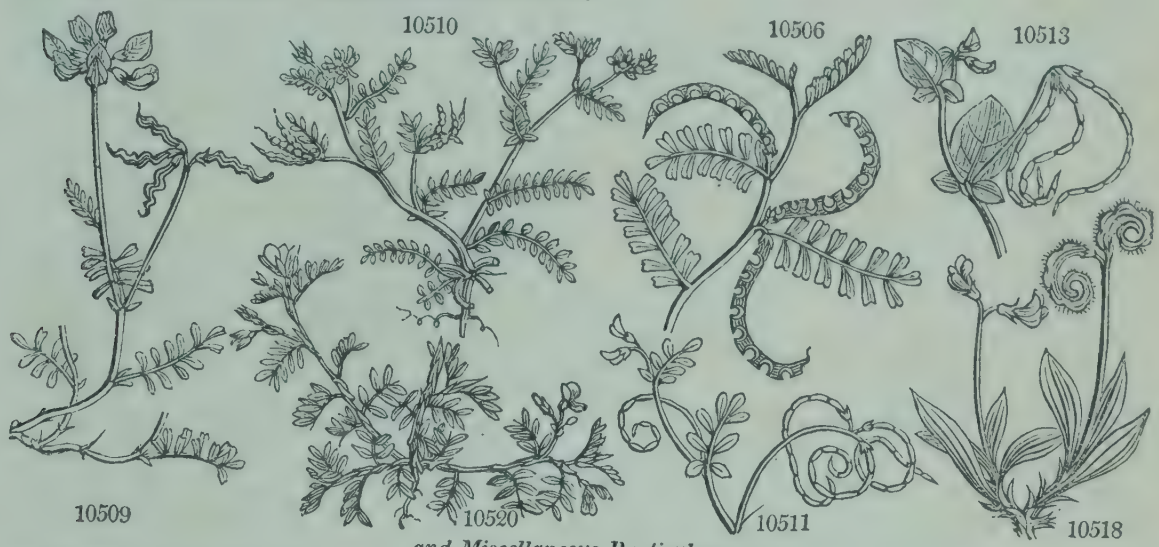
10506 Pods sessile solitary erect
10507 Pods stalked clustered circular : lobed on one edge
10508 Pods stalked clustered smooth lobed on the outer edge, Leaves and cal. hairy
10509 Pods stalked clustered arcuate rough sinuated on one side

10510 Leaves pinnated, Flowers capitate with a bractea, Pods roundish incurved
10511 Leaves pinnated, Flowers capitate without a bractea, Pods round incurved

10512 Leaves pinnated, Flowers capitate with a bractea, Pods compressed recurved rugose
10513 Leaves ternate subsessile : the odd one very large
10514 Leaves ternate or quinate : the odd one largest, Stipules large membranous 2-toothed
10515 Leaves pinnated, Pods rugose pendulous scarcely bowed, Joints compressed roundish

10516 Pedunc. 1-fl. Pods covered over with blunt scales
10517 Pedunc. 2-fl. Pods bluntly aculeate outwardly
10518 Pedunc. about 3-fl. Pods bearing outwardly distinct acute spines
10519 Pedunc. about 4-fl. Pods bearing outwardly clustered acute spines

10520 Lips of calyx entire, Racemes stalked few-flowered



and Miscellaneous Particulars.

end of which the roots may be taken up by trenching over the ground. The roots are either immediately sold to the brewers' druggists, or to common druggists, or preserved, like carrots or potatoes, in sand, till wanted for use. They are used in medicine and porter-brewing.

1576. *Coronilla.* From *corona*, a crown. Its pretty flowers are disposed in little tufts like coronets. Handsome free-flowering shrubs, of easy culture. C. valentina, glauca, and viminalis are valuable as flowering in winter, and often all the summer. C. argentea bears a profusion of flowers, which have a strong sweet scent. The silvery color of this plant is occasioned by its growing on a poor dry soil ; and if it is removed into better ground, it will take a glaucous color ; and the contrary. C. emerus is a popular shrub of much beauty.

C. varia is a strong coarse-growing plant, and has been grown as an adjunct to clover, lucern, &c. Curtis says, it is bitter ; but others have found horses and cows to eat it greedily.

1577. *Hippocrepis.* From ἱππος, an horse, and κρηπις, a shoe ; in allusion to the form of its pod. Pretty little annual plants, with bright yellow flowers.

1578. *Ornithopus.* From ορνις, a bird, and πους, a foot. The pods are twisted and curved in such a manner as to resemble the claws of a small bird. Curious on account of their jointed pods, but not worth culture as plants of ornament. O. sativus is a most valuable agricultural plant. It was introduced for purposes of field culture about the year 1818, from Portugal, under the name of Serradilla. Sown upon the barren, light, sandy downs of Thetford, in Norfolk, it produced an abundant crop of most excellent fodder, where nothing else would grow. It is exceedingly like O. scorpioides, except that it arrives at the height of two feet instead of as many inches.

1579. *Scorpiurus.* From σκορπιος, a scorpion, and ουρα, a tail ; on account of the twisted pod, which is very like the tail of some reptile.

1580. *Smithia.* In memory of Sir James Edward Smith, M. D., F. R. S., knight, president of the Linnean Society, possessor of the Linnean herbarium, and author of various elementary and other useful botanical works. These are inconspicuous worthless weeds, possessing little interest beyond their irritable foliage.

History, Use, Propagation, Culture,

1581. *Sesbania.* The Arabic name *Sesban*, a little Latinized. Most of these plants are ornamental. S. grandiflora is a beautiful plant; it grows in peat and loam, and cuttings root in sand under a hand-glass.

1582. *Æschynomene.* A name given by Pliny to a plant which withdrew its leaves from the contact of the hand. It is derived from αισχυνομαι, to be modest. One of the species of Æschynomene is sensitive, but it is not the plant of Pliny.

1583. *Stylosanthes.* From στυλος, a style, and ανθος, a flower: a flower with a very long style. Worthless tropical weeds.

1584. *Hallia.* Named after Birger Martin Hale, a pupil of Linnæus, and the student under whose name the thesis called Nectaria florum stands in the Amœnitates Academicæ.

1585. *Lespedeza.* Named by Michaux, in honor of Lespedez, a governor of Florida, who protected that botanist in his botanical researches. Herbaceous, chiefly North American plants with little merit.

1586. *Flemingia.* Named after Dr. John Fleming, president of the East India Company's Medical Board at Bengal.

1587. *Zornia.* Supposed to have been named after Mr. John Zorn, an apothecary at Kempten, in Bavaria, author of a work called Icones Plantarum Medicinalium, in five volumes, octavo, between the years 1779 and 1784. There was also a Dr. Bartholomew Zorn, of Berlin, author of Botanologia Medica, 1714, &c. &c.

1588. *Hedysarum.* From ηδυς, sweet, and αρωμα, smell; some the species have fragrant flowers. A

10521 Racemes about 3-fl. Leafl. obl. emarg. smooth, Pods filiform straight compressed
10522 Racemes many-fl. Leafl. lin. blunt mucronate, Rachis of leaves smooth, Pods filiform round
10523 Racemes few-fl. Leafl. linear blunt mucronate, Rachis of leaves prickly, Pods filiform round
10524 Pedunc. 1-fl. Leafl. lin. blunt mucronate, Rachis of leaves smooth
10525 Racemes many-fl. pendulous, Leafl. lin. blunt, Pods filiform round moniliform

10526 Stem smooth, Leafl. lin. blunt, Racemes few-flowered, Pods smooth
10527 Stem rough below, Leafl. lin. blunt, Racemes comp. hispid, Joints of pod rough in middle
10528 Stem hispid, Leafl. lin. blunt, Racemes simple, Pods hispid
10529 Stem hispid, Leafl. lin. falcate acuminate, Racemes simple, Joints of pods roundish distinct smooth
10530 Stem smooth, Pods smooth torose on one side and blunt, Leaflets blunt

10531 Leaves ovate lanc. smooth, Spikes many-fl. Bractes smooth mucronate, Stem downy

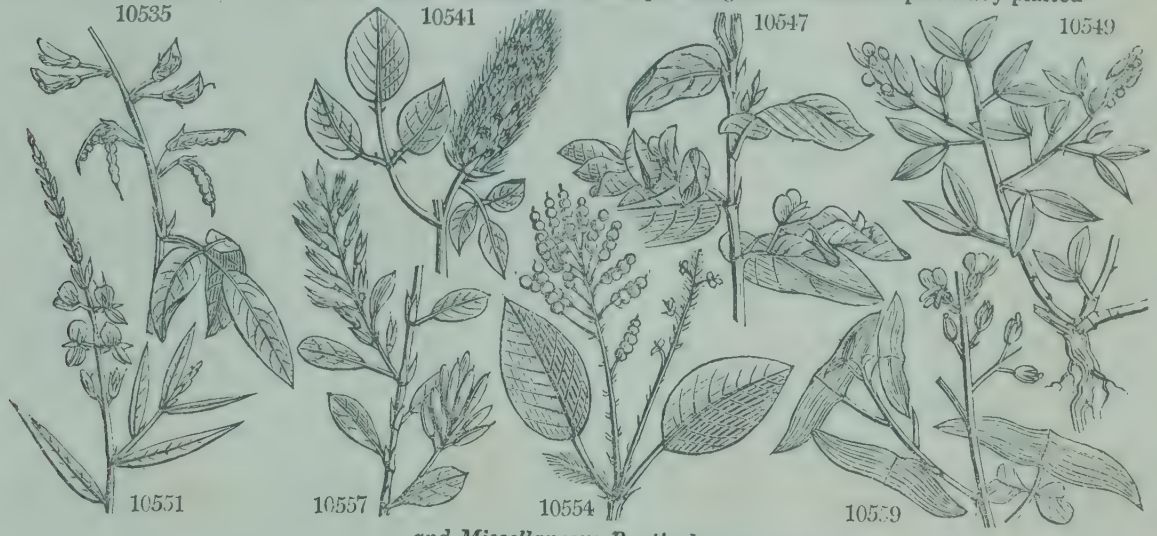
10532 Leaves lanc. mucronate smooth, Pedunc. 1-fl. the length of leaves
10533 Leaves cordate obl. acute smooth, Pedunc. the length of leaves
10534 Leaves cordate ovate convolute imbricated, Flowers axillary sessile

10535 Leafl. subovate villous beneath, Flowers in sessile fasicles, Stem shrubby
10536 Leafl. oblong, Fasicles of flowers sessile numerous, Pods nearly naked acute
10537 Leafl. somewhat lin. hairy beneath, Racemes axillary, Pods smooth length of calyx
10538 Simple, Leafl. ellipt. Spikes capitate on short stalks axillary and terminal, Cal. vill. length of cor.
10539 Branched villous, Leafl. round oval, Spikes axillary on long stalks, Cor. as long as calyx
10540 Branched diffuse, Leafl. ellipt. blunt hairy beneath, Racemes short umbelled
10541 Leaves ternate ovate, Racemes oblong, Pods inflexed, Calyx hairy

10542 Stem subsimple upright, Leafl. broad lanc. smooth, Racemes axill. sol. length of petiole
10543 Branched nearly upright, Leafl. ellipt. smooth, Petioles winged, Racemes panicled term. and axillary
10544 Nearly erect, Leafl. broad-lanc. Racemes axillary clustered
10545 Somewhat branched, Leafl. obovate, Petioles winged, Racemes clustered, Pods gland. viscid
10546 Erect branched, Leafl. obovate cuneate, Racemes axill. on long stalks dichotomous
10547 Leaves simple, Spikes like cones, Bractes cucullate foliaceous netted

10548 Leaves ternate large, Bractes numerous orbicular lined
10549 Leaves binate ovate-lanc. Bractes ovate acute

10550 Leaves simple lanc. blunt, Stem spiny
10551 Leaves simple lanc. acute, Stem unarmed, Stipules scarious
10552 Leaves simple obovate roundish, Stipules scarious shorter than petiole, Pods smooth netted
10553 Leaves simple cordate-roundish blunt smooth above downy beneath
10554 Leaves simple ovate acute with stipules
10555 Leaves simple cordate oblong stalked winged, Branches 3-cornered
10556 Leaves simple ovate blunt
10557 Leaves simple cordate oblong, Petioles simple, Stipules sheathing
10558 Leaves simple cordate lanc. sagittate, Flowers solitary, Pedunc. capillary very long
10559 Leaves simple and ternate intermediate 2-lobed : lobes spreading lanc. Joints of pod wavy plaited



and Miscellaneous Particulars.

numerous genus, not remarkable for beauty, but containing two curious species, the manna plant, and the turning Hedysarum ; and one of considerable importance in European agriculture, the Saint-foin.

H. Alhagi is a thorny shrub, with lanceolate leaves, and coriaceous, subcylindric, and scarcely jointed pods. It is on this plant that Manna Trungebeen is found in Mesopotamia (*Russ. Alepp.*) and other eastern countries. It is chiefly gathered about Tauris, where the shrub grows plentifully. Sir George Wheeler found it growing in Tinos ; Tournefort also found it in many plains of Armenia and Georgia, and made a distinct genus of it, under the name of Alhagi, from the Arabic *Aghul* or *Al-gul.*

H. gyrans is a native of Bengal near the Ganges ; and is called there *Buram Chadali*, or *Burram Chandali.* This is a wonderful plant, Linnæus observes, on account of its voluntary motion, which is not occasioned by any touch, irritation, or movement in the air, as in Mimosa, Oxalis, and Dionæa ; nor is it so evanescent as in Amorpha. No sooner had the plants raised from seed acquired their ternate leaves, than they began to be in motion this way and that ; this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order or direction ; one leaflet frequently revolved, whilst the other on the same petiole was quiescent ; sometimes a few leaflets only were in motion, then almost all of them would be in movement at once : the whole plant was very seldom agitated, and that only during the first year. It continued to move in the stove during the second year of its growth, and was not at rest even in winter. (*Supp. Linn.*) Swartz observes, that the motion is irregular, and that it sometimes ceases entirely ; that in a very hot day it is immoveable, being agitated only in the evening, and that slowly. In our climate, the leaves, in

History, Use, Propagation, Culture,

general, only make a faint and feeble attempt towards the middle of the day at exerting their extraordinary faculty. (*Shaw.*)

This motion does not depend upon any external cause that we can trace, and we are not able to excite it by any art that we possess. It is not the action of the sun's rays, for this plant is fond of shade, and the leaves revolve well on rainy days, and during the night: exposed to too much wind or sun, it is quiet. Perhaps, says Linnæus, there may be some part in vegetables, as in animals, where the cause of motion resides.

H. coronarium, *Sulla*, or *Sainfoin à bouquets*, Fr., is an esteemed border biennial, and some speculative agriculturists recommend it for cultivation as a field plant. In Calabria it grows wild in great luxuriance, near four feet high, affording excellent nourishment to horses and mules, both green and made into hay: but it does not well bear the spring in the north of Italy: we may presume, therefore, that it will scarcely bear our climate well enough to answer the purposes of husbandry. Osbeck mentions, that he saw it brought into Cadiz in great bundles, as food for cattle.

H. Onobrychis, *L'esparcet*, Fr., *Esparzette*, Ger., and *Cedrangolo*, Ital., is a deep rooting perennial, with branching spreading stems, compound leaves, and shewy red flowers. It is a native of many parts of Europe, but never found but on dry warm chalky soils, where it is of great duration. It has been long cultivated in France, and in other parts of the continent, and as an agricultural plant, a good deal in England, in the chalky districts; and its peculiar value is, that it may be grown on soils unfit for being constantly under tillage, and which would yield little undergrass. This is owing to the long and descending roots of the saint-foin, which will penetrate and thrive in the fissures of rocky and chalky understrata. Its herbage is said to be equally suited for pasturage or for hay, and eaten green it is not so apt to swell or hove cattle as the clovers or lucern. Arthur Young says, that upon soils proper for this grass no farmer can sow too much of it, and in

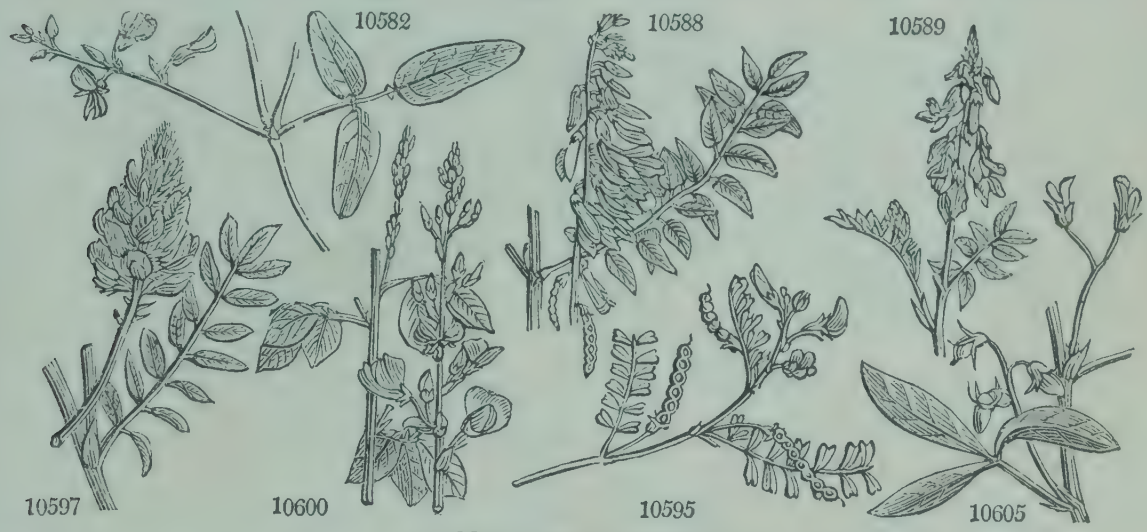
10604 Leaves pinnate obl. smooth, Petals nearly equal, Pods 1-seeded prickly, Teeth of crest lanceolate
10605 Leaves pinnate, Racemes long, Pods inflexed



ana Miscellaneous Particulars.

The Code of Agriculture, it is said to be "one of the most valuable herbage plants we owe to the bounty of providence."

The deeper the soil is stirred previously to sowing the better; the seed is generally put in broad cast, at the rate of three or four bushels the acre, and sometimes a little red clover is sown afterwards to produce a crop the second season, when the saint-foin plants are but small. When saint-foin is annually mown, it should be top-dressed with manure; but if only occasionally mown, the benefits derived from the grazing of sheep or cattle will, to a considerable extent, answer for surface dressings in a plant that derives a part of its nutriment from the subsoil. Saint-foin is highly nutritive, either cut green or made into hay. The produce, on a medium of soils and cultivation, may probably be estimated at from about one and a half to two tons the acre. And on the poorer and thinner staple sorts of land, it will perhaps seldom afford less than from a ton to a ton and a half on the acre. One thousand parts of saint-foin afforded Sir H. Davy thirty-nine of nutritive matter, which is the same as that afforded by the red and white clover.

The usual duration of saint-foin, in a profitable state, is from eight to ten years. It usually attains its perfect growth in about three years, and begins to decline towards the eighth or tenth on calcareous soils, and about the seventh and eighth on gravels. There are instances, however, of fields of saint-foin, which had been neglected and left to run into pasture, in which plants have been found upwards of fifty years from the time of sowing. It has been cultivated upwards of a century on the Cotswold hills, and there roots of it have been traced down into stone quarries from ten to twenty feet in length, and in Germany, Von Thaer found them attain the length of sixteen feet. In general, the great enemy to the endurance of saint-foin, is the grass which accumulates, and forms a close turf on the surface, and thus chokes up the plant.

History, Use, Propagation, Culture,

1589. *Indigofera.* That is to say, a plant bearing *indigo.* The species are elegant little shrubs, free-flowerers, and of easy culture. Most of them will yield the dye, but those chiefly cultivated for this purpose are the I. Anil (*Alnyl*, Arab.), in the West Indies, and the I. tinctoria, argentea, and some other species in the East Indies. The indigo is one of the most profitable articles of culture in Hindustan; because an immense extent of land is required to produce but a moderate bulk of the dye; because labor and land here are cheaper than any where else; and because the raising of the plant and its manufacture may be carried on without even the aid of a house. The first step in the culture of the plant is to render the ground, which should be friable and rich, perfectly free from weeds, and dry if naturally moist. The seeds are then sown in shallow drills about a foot apart. The rainy season must be chosen for sowing, otherwise if the seed is deposited in dry soil, it heats, corrupts, and is lost. The crop being kept clear of weeds, is fit for cutting in two or three months, and this may be repeated in rainy seasons every six weeks. The plants must not be allowed to come into flower, as the leaves in that case become dry and hard, and the indigo produced is of less value; nor must they be cut in dry weather, as they would not spring again. A crop generally lasts two years. Being cut, the herb is first steeped in a vat till it has become macerated and parted with its coloring matter; then the liquor is let of into another, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water. This fecula is let off into a third vat, where it remains some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes placed in the shade. Before it is perfectly dry, it is cut in small pieces of an inch square; it is then packed in barrels, or sowed up in sacks for sale. Indigo was not extensively cultivated in India before the British settlements were formed there; its profits were at first so considerable, that, as in similar cases, its culture was carried too far, and the market glutted with the commodity. The indigo is one of the most precarious of oriental crops; being liable to be destroyed by hail storms, which do comparatively little injury to the sugar-cane and other plants.

The indigo cultivated in the West Indies, thrives best in a free rich soil, and a warm situation, frequently refreshed with moisture. Having first chosen a proper piece of ground, and cleared it, hoe it into little

10606 Leaves simple filiform, Flowers racemose
10607 Leaves simple linear hoary, Pods globose

10615 Leaves ternate obovate on short stalks, Pedunc. long filiform, Pods pendulous
10616 Leaves quinate obovate mucronate hairy, Stipules subulate, Pods straight smooth
10617 Leaves pinnate cuneate 7, Racemes as long as leaves, Pods 4-cornered 2-seeded
10618 Leaves pinnate 5 or 7 oblong narrowed at each end, Racemes longer than leaf
10619 Leaves pinnate 7 or 9 oblong downy beneath, Racemes about 5-flowered sessile, Stem straight
10620 Leaves pinnate of 4 or 5 pairs hoary beneath, Racemes length of leaves spiked, Pods 4-cornered villous
10621 Leaves pinnate linear, Racemes axillary, Stem shrubby downy
10622 Leaves pinnate smooth of many pairs oblong, Racemes shorter than leaf, Standard smooth
10623 Leaves pinnate of 6 pairs obovate strigose, Racemes shorter than leaf, Pods pendulous, Stem viscid
10624 Leaves pinnate oblong of 3 pairs, Racemes shorter than leaf, Pods falcate
10625 Leaves pinnated obl. smooth of 4 pairs, Racemes shorter than leaf, Pods round arcuate
10626 Leaves simple ternate and pinnate silky, Pods torulose pendulous
10627 Leaves pinn. obl. smooth, Racemes spiked shorter than leaf, Pods 4-cornered reflexed
10628 Stem muricate downy, Leafl. oval hairy, Stip. oval acute, Racemes longer than leaves
10629 Leaves about 3, Leafl. lanc. blunt mucronulate smooth deciduous, Petioles persistent

10630 Leafl. obl. lanc. blunt downy beneath, Raceme terminal long, Pods round spreading
10631 Pods falcate backwards compressed villous spiked, Calyxes woolly, Leafl. oval-obl. acuminate
10632 Leafl. obl. mucronate downy beneath, Stip. ovate acuminate, Raceme 4-fl. terminal, Pods pendulous
10633 Leafl. cuneate-obl. recurved mucronate villous beneath, Stipules subulate, Raceme few-fl.
10634 Pods straight spreading ciliated, Stip. subulate, Leafl. 9-11 obl. acute downy beneath
10635 Leafl. lanc. cuneate retuse silky beneath, Stip. setaceous, Pods falcate backwards villous pendulous
10636 Pods straight ascending villous, Stip. subulate, Pedunc. 2-edged, Leafl. obl. blunt
10637 Leafl. obl. cuneate emarg. mucronate smooth, Stip. subulate, Pods racemose straight ascending
10638 Leafl. inversely lanc. obtuse emarg. silky beneath, Racemes terminal short
10639 Leafl. inversely lanc. emarg. mucronate hairy, Stip. subulate, Racemes terminal

10640 Leafl. lanc. mucronate smooth, Stip. lanc. sagittate, Pods erect straignt

10641 Leafl. ovate acuminate smooth, Stip. ovate, Flowers cernuous
10642 Leafl. obl. acute downy beneath, Stip. subulate, Pods smooth racemose pendulous
10643 Leafl. ovate acute downy, Stip. subulate, Pods straight pendulous smooth racemose
10644 Leaves pinn. ovate mucron. villous, Stem erect, Branches downy

and Miscellaneous Particulars.

trenches, not above two inches, or two inches and a half in depth, not more than fourteen or fifteen inches asunder. In the bottom of these, at any season of the year, strew the seeds pretty thick, and immediately cover them. As the plants shoot, they should be frequently weeded, and kept constantly clean, until they spread sufficiently to cover the ground. Those who cultivate great quantities, only strew the seeds pretty thick in little shallow pits, hoed up irregularly, but generally within four, five, or six inches of one another, and covered as before Plants raised in this manner, are observed to answer as well, or rather better, than the others; but they require more care in the weeding. They grow to full perfection in two or three months, and are observed to answer best when cut in full blossom. The plants are cut with reaping hooks, a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper. Seventeen negroes are sufficient to manage twenty acres of indigo; and one acre of rich land, well planted, will, with good seasons and proper management, yield five hundred pounds of indigo in twelve months, for the plant ratoons (i. e. it sends out stolones), and gives four or five crops a year; but must be replanted afterwards.

Indigo has long been cultivated in Spain, but is on the decline in that country, owing to the more favorable circumstances of the East and West Indies. It was tried in the south of France and Italy, during the Buonaparte dynasty, but found not worth following for the same reason.

1590. *Tephrosia.* From τεφρος, ash-colored, in allusion to the color of the foliage. T. toxicaria is a spreading shrubby plant. The leaves and branches, well pounded, and thrown into a river or pond, very soon affect the water, and intoxicate the fish, so as to make them float on the surface, as if dead; most of the large ones recover after a short time, but the greatest part of the small fry perish on these occasions. It has been introduced to Jamaica, and cultivated there, on account of its intoxicating qualities. (*Browne*)

1591. *Galega.* A name of unexplained meaning. Ruellius says, it is the word *Glaux*, Italianized! G. officinalis was formerly accounted cordial and sudorific, but is now out of repute. The species are handsome border flowers.

History, Use, Propagation, Culture,

1592. *Phaca.* Φακη, or φακος, was the Greek name of the lentil; and was derived from φαγω, to eat. These are pretty herbaceous plants, with the habit of Astragalus.

1593. *Oxytropis.* From οξυς, pointed, and τροπις, a keel. A genus entirely resembling Astragalus in habit; but considered distinct by modern botanists.

1594. *Astragalus.* This was a name given by the Greeks to one of their leguminous plants, but it is not known to which. The modern genus is composed of plants, the greater number of which are very orna-

10645 Erect hairy, Leafl. oval acute, Stip. lanc. Pods obl. cymbiform compressed
10646 Erect undivided, Leafl. 11 obl. blunt subciliated, Pods oblong inflated
10647 Erect branched downy, Leafl. in many pairs obl. lanc. blunt, Pods half ovate acute
10648 Branched ascending, Leafl. about 17 lanc. : the odd one subsessile, Alæ bifid
10649 Branched ascending smooth, Leafl. about 11 lin.-lanc. : the odd one subsess. Pods obovate inflated erect
10650 Caulescent procumb. Fl. pendulous racemose, Pods acute at each end hairy

10651 Stemless villous, Pods erect roundish-obl. villous acuminate with style half 2-celled
10652 Stemless silky, Leafl. 19 lanc. ellipt. acute at each end, Spikes capitate
10653 Stemless villous silky, Pods erect ovate cylindr. inflated 2-celled
10654 Stemless, Leafl. lanc. silky, Scape longer than leaf and calyxes silky, Heads few-fl. cernuous

10655 Stemless, Calyx and pods villous, Leafl. lanc. acute, Stem decumbent
10656 Stemless, Pods subulate hooked longer than leaf, Leafl. obcordate
10657 Stemless, Leafl. lanc. smooth, Scapes as long as leaves hairy, Flowers in obl. heads
10658 Stemless, Leafl. cuneiform retuse subsessile, Pods smooth, Flowers nearly apetalous
10659 Caulescent erect hairy, Leafl. lanc. acute, Spikes stalked longer than leaf, Pods subulate hairy
10660 Caulescent erect hairy, Leafl. 3-pair lanc. acute, Stip. obl. acum. Spikes stalked longer than leaf
10661 Caulescent ascending, Leafl. ovate lanc. deflexed hairy, Spikes stalked longer than leaf
10662 Caulescent diffuse downy, Stipules united, Wings emarg. Peduncles as long as leaf

10663 Caulescent erect, Leafl. ellipt. stalked, Stip. lin. subulate, Pedunc. about 3-fl. axill. clustered
10664 Caulescent erect, Leafl. roundish cordate sessile downy, Stip. ovate acuminate, Pedunc. 1-fl. axill.
10665 Caulescent erect, Spikes cylindrical subsessile, Cal. and pods woolly
10666 Caulescent erect, Heads of flowers stalked globose, Pods 4-seeded inclosed in woolly calyx
10667 Caulescent erect, Heads of flowers sessile axill. short, Corolla larger than calyx
10668 Caulescent erect, Heads globose, Pedunc. very long, Leafl. emarginate
10669 Caulescent erect striated, Leafl. lin. lanc. smooth, Stip. lanc. Racemes longer than leaf
10670 Caulescent erect panicled, Leaves of 2 or 3 pair linear cuneate retuse smooth, Racemes filiform
10671 Caulescent erect shrubby, Leaves in 6 pairs lin. lanc. hoary, Racemes long spiked
10672 Caulescent erect, Leafl. linear lanc. Spikes obl. stalked longer than leaf, Standard twice as long as alæ
10673 Caulescent erect rough, Leafl. lin. lanc. Spikes stalked longer than leaves straight, Pods 3-cornered
10674 Caulescent erect straight smooth, Leafl. ellipt. blunt, Fl. racemose pendulous, Pods 3-cornered smooth
10675 Caulescent erect straight smooth, Leafl. ellipt. blunt, Fl. racemose pendulous, Pods inflated rugose
10676 Caulescent erect smooth, Leafl. lanc. acute, Racemes longer than leaf, Pods falc. acute pendulous
10677 Caulescent erect, Peduncles as long as leaves, Leaflets 33-41, Pods about 3-cornered arcuate
10678 Caulescent erect, Leafl. obl. downy, Spikes stalked, Bractes obl. length of calyx
10679 Caulescent erect, Leafl. obl. downy beneath, Spikes stalked, Bractes lanc. length of peduncle
10680 Caulescent diffuse, Pods subcylindrical mucronate, Leafl. naked beneath
10681 Pedunc. as long as leaves, Leafl. 33-41 scarcely downy, Pods 3-cornered bowed nodding
10682 Pedunc. as long as lvs. Leafl. smoothish obl. blunt mucro. Stip. lanc. Racemes stalked longer than leaf
10683 Pedunc. as long as lvs. silky-white, Leafl. 21 ellipt. smooth above, Spikes subsessile, Pods fleshy
10684 Pedunc. longer than leaf, Fl. erect closely spiked, Pods half 2-celled
10685 Caulescent prostrate, Leafl. smooth ovate mucronate blunt, Stip. ovate-lanceolate
10686 Caulescent erect spread. Leafl. ov. hairy, Stip. solitary opp. the lvs. 2-parted, Spikes stalked long. than leaf
10687 Caulescent, Scapes 2-fl. Pods hooked subulate with 2-keels
10688 Caulescent prostrate, Leafl. ellipt. cuneate emarg. Racemes few-fl. Peduncles longer than leaf
10689 Caulescent procumbent, Leafl. cuneate emarg. Stip. ov. Racemes few-fl. stalked shorter than leaf
10690 Caulescent erect, Leafl. obl. retuse, Fl. axill. sol. subsessile, Pods deeply channelled
10691 Caulescent procumbent downy, Leafl. obovate emarg. Racemes stalked arcuate twisted
10692 Caulesc. procumb. Leafl. obl. blunt mucro. Spikes stalked few-fl. shorter than lvs. Pods obl. hooked at end
10693 Caulescent diffuse, Heads stalked lateral, Pods straight subulate mucronate
10694 Caulescent diffuse, Leafl. ellipt. emarg. Racemes few-fl. stalked shorter than leaf, Pods hooked
10695 Stemless, Leaves ellipt. downy, Scapes racemose longer than leaf, Pods obovate the length of calyx
10696 Caulescent, Leaflets oval-oblong or obovate smooth, Stipules very large leafy
10697 Stem decumb. Leafl. obl. downy, Pedunc. axill. few-fl. Pods arcuate with elevated veins
10698 Stemless, Leafl. subulate 4 whorled pilose, Scapes spiked longer than leaf, Lower flowers remote
10699 Caulescent diffuse, Heads subsessile lateral, Pods erect subulate with a reflexed point
10700 Caulescent diffuse, Pods subulate incurved smooth, Leafl. obovate
10701 Caulescent procumb. Leafl. obl. retuse, Heads stalked shorter than leaf, Pods half ovate squamose at end
10702 Caulescent procumb. Leafl. lin. narrowed at base, Heads subsessile, Pods half ovate reflexed downy

and Miscellaneous Particulars.

mental. A. glycyphyllos is the largest of the European species. The leaves are sweet, with a mixture of bitterness, and do not seem to be agreeable to cattle; at least the plant, in its wild state, is left untouched; otherwise it might have been desirable to cultivate it.

A. Tragacantha was formerly considered as the plant yielding the gum Tragacanth of commerce; but Olivier (*Voyage dans l'Empire Ottoman*, v. 342. pl. 44.) discovered that it was generally procured from A. verus. It is probable that both species, and perhaps some others, yield this gum. A. verus is a native of the north

History, Use, Propagation, Culture,

of Persia, flowering in July and August. It rises two or three feet only in height, on a stem about an inch in thickness; with many branches closely crowded together, and covered with imbricated scales and spines, formed from the petioles of the former year. The leaves, which scarcely exceed half an inch in length, are composed of six, seven, or eight pairs of opposite, villous, stiff, pointed leaflets; and the mid-rib is terminated with a sharp yellowish point. The flowers are small, yellow, and proceed from the axillæ of the leaves with cottony bractes. The calyx is five-toothed, and shorter than the corolla, which is papilionaceous. The gum exudes in summer, more or less copiously according to the heat of the weather, in tortuous filaments, which are allowed to dry on the plant before being collected. A large portion of the Tragacanth collected in Persia, is sent to India, Bagdad, Bassorah, and Russia. But what we receive is sent to Aleppo, whence it is exported, packed in cases.

Good gum Tragacanth is inodorous; impressing a very slightly bitter taste as it dissolves in the mouth. Its mucilage differs from that of acacia gum, in being precipitated by the superacetate of lead, and oxymuriate of tin; and not by silicated potass (*Bostock. Nich. Journ.* lviii. 30.), or the oxysulphate of iron. Medicaliy it is de-

10703 Caulescent procumb. Leafl. obl. blunt, Spikes ov. stalked longer than leaf, Pods erect ovate channelled
10704 Caulescent procumb. Leafl. lin. trunc. emarg. Racemes stalked longer than leaf, Wings of cor. bifid
10705 Caulescent erect. Lvs. 7 pairs obl. bluntish subpubescent, Heads few-flowered stalked, Pods obl. villous
10706 Caulescent branched prostrate, Leafl. lin. lanc. silky complicate, Racemes 6-fl. longer than leaf
10707 Caulescent procumb. Leafl. obcordate silky beneath, Racemes stalked as long as leaves
10708 Subcaulescent procumb. Leafl. obovate. Racemes shorter than petiole, Pods round lanc. reflexed
10709 Caulescent decumb. Leafl. ellipt. blunt, Spikes obl. stalked longer than leaf
10710 Caulescent diffuse, Heads stalked imbricated ovate, Fl. erect, Pods ovate callous inflated
10711 Caulescent prostrate, Umbels stalked, Pods prismatical 3-cornered erect subulate at end
10712 Caulescent diffuse hoary, Leaves 5 pairs, Leafl. ellipt. blunt, Spikes stalked longer than leaf
10713 Caulescent diffuse, Pedunc. spiked, Standard twice as long as flower
10714 Caulescent procumb. Spikes long, Pods oblong 3-cornered furrowed mucronate villous
10715 Stemless, Leafl. ov. glauc. Scapes longer than leaf, Fl. capitate, Pods inflated membranous smooth
10716 Stemless smooth, Calyxes bladdery contracted at mouth
10717 Stemless, Leafl. ov. obl. acute hairy, Scapes racemose erect twice as short as leaf, Pods ovate villous
10718 Stemless, Leafl. ellipt. retuse somewhat hairy, Scapes racemose few-fl. twice as short as leaf
10719 Stemless, Leafl. ellipt. blunt, Scapes racemose declinate longer than leaf, Standard long
10720 Stemless, Scapes decumb. Leafl. ovate subsessile downy beneath, Pods hoary
10721 Stemless, Leafl. obl. blunt hairy, Flower somewhat stalked aggregate, Cal. appressed hairy
10722 Nearly stemless, Fl. numerous radical subsessile
10723 Petioles spiny, Leafl. obl. mucro. hairy, Pedunc. very short about 4-fl. Cal. teeth setaceous
10724 Petioles spiny, Leafl. ellipt. hoary, Pedunc. about 4-fl. as long as leaves, Cal. teeth ovate
10725 Petioles spiny, Leafl. obl. hoary, Pedunc. very short 2-flowered

10726 The only species

10727 Pentandrous, Spikes obl. stalked terminal, Bractes length of cal. Leaves in 6 pairs lin. cuneate retuse
10728 Pentandrous, Spikes cylindric. stalked term. Bractes shorter than cal. Lvs. in 10 pairs ellipt. retuse mucr.
10729 Spikes obl. term. sol. Lvs. about 3 pair obl. and obovate obtuse
10730 Spikes long panicled, Lvs. about 4 pairs linear
10731 Decandrous, Spikes capitate stalked axillary, Leaves in 4 pairs obl. blunt
10732 Decandrous, Spikes capitate stalked term. Lvs. in 10 pairs obovate
10733 Decandrous, Spikes cylindr. terminal, Lvs. of 15 pairs lanc. blunt
10734 Decandrous, Spikes cylindr. terminal, Lvs. of 10 pairs obcordate
10735 Decandrous, Spikes term. long, Lvs. of 5 pairs obovate

10736 Lvs. pinn. of 2 pairs lin. Pedunc. axill. 1-fl.
10737 Lvs. pinn. of 7 pairs lin.-lanc. Pedunc. 1-fl. axillary
10738 Lvs. pinn. and tern. lanc. Pedunc. axill. 1-3-flowered, Branches warted
10739 Lvs. tern. cuneiform recurve mucronate, Flowers axillary solitary approximated
10740 Lvs. tern. obovate recurve mucro. with pellucid spots, Spike term. capitate, Bractes ciliated
10741 Lvs. tern. obovate recurve mucronate dotted beneath, Spike terminal oblong
10742 Lvs. of the stem and branches ternate and simple; of the branchlets none, Stipules imbricated
10743 Upper lvs. simple; rest ternate, Leafl lin. lanc. mucronate, Pedunc. axill. clustered capitate
10744 Upper lvs. simple; rest ternate, Leafl. lin. lanc. mucro. Pedunc. axill. solitary
10745 Leaves tern. lanc. cuneate with a recurved mucro. Pedunc. axill. aggregate
10746 Leaves tern. obovate with a recurved mucro, Pedunc. axill. solitary
10747 Leaves tern. stalked obl. mucro. Spikes terminal interrupted, Calyxes villous
10748 Leaves tern. obovate emarg. Stem creeping, Flowers in umbels
10749 Leaves tern. Leafl. ov.-lanc. Petioles downy smooth, Spikes capitate stalked axillary
10750 Leaves tern. Leafl. ov.-lanc. acum. Petioles rough, Racemes axillary
10751 Leaves ternate silky beneath, Pedunc. axillary about twice as long as leaves, Heads depressed involucred
10752 Leaves tern. ovate, Petioles downy sulcate, Spikes capitate stalked axillary

and Miscellaneous Particulars.

mulcent, and may answer the purposes of the acacia gum; being even better adapted for allaying tickling cough, and sheathing the fauces in catarrhal affections, owing to its great viscidity. It is chiefly, however, employed for pharmaceutical purposes. (*Thomson's London Dispensatory*, 187.) The seeds of A. bœticus are roasted, ground, and used as a substitue for coffee in Hungary.

1595. *Biserrula.* From *bis*, twice, and *serrula*, a little saw. The pods are toothletted on each edge. Pelecinon was the name given by the Greeks to the plant called by the Latins *Securidaca.*

1596. *Dalea.* Named after Thomas Dale, an English botanist, who lived in the beginning of the last century. There was another Dale, an author of a Pharmacologia. These are pretty little plants, with the aspect of Psoralea.

1597. *Psoralea.* From ψωραλεος, warted, on account of the numerous little tubercles with which most of the species are covered. The species are chiefly low shrubs; some of them are ornamental, and all are of easy culture and propagation by young cuttings in sand or seeds, which they produce in abundance. P. esculenta, the bread-root of America, is cultivated in Missouri, and other parts of that country. In this climate it will

History, Use, Propagation, Culture,

grow in the open air, but requires the protection of a frame to produce abundant crops of roots, which are used like those of the potatoe in the countries where it is a native. (*Pursh. Amer.* t. 22.)

1598. *Melilotus.* From *Mel,* honey, and *Lotus.* These plants are similar to the Lotus, and are the favorite resort of bees. M. officinalis is the chief ingredient in flavoring the Gruyère cheese. This cheese no doubt owes its chief excellence to the mixture of herbs in the mountain pasturage which surrounds the valley of Gruyère, but partly also to the flowers and seeds of this plant, which are bruised and mixed with the curd before it is pressed.

1599. *Lupinaster.* That is to say, *Lupine-like.* A pretty little herbaceous plant, with bright flowers.

1600. *Trifolium.* A plant with three leaves; the τριφυλλον, of the Greeks, *trêfle,* of the French, and *trefoil,* of the English. This genus includes the two most valuable herbage plants adopted in European agriculture, the white and red clover. Notwithstanding all that has been said of the superiority of lucern to clover, and of the excellence of saint-foin, and various Leguminosæ of the pea kind, yet the red clover for mowing, and the white species for pasturage, are, and probably ever will be, found to excel all other plants in these respects. The yellow clover, T. procumbens, and the cow or meadow clover, T. medium, are also in cultivation, but are far inferior to the others. The meadow clover is a useful addition to the white sort in laying down permament pastures; the yellow grows on poor soils, but the herbage is not much liked by cattle. The soil best adapted for clover is a deep sandy loam, which is favorable to its long tap-roots: but it will grow in any soil, provided it be dry. So congenial is calcareous matter to clovers, that the mere strewing of lime on

10753 Leaves tern. roundish ovate repand at end, Spikes interrupted axillary
10754 Leaves tern. and simple linear, Head terminal
10755 Leaves simple ovate somewhat toothed, Spikes ovate
10756 Leaves digitate quinate lanc. unequal flat entire villous, Spikes axillary dense
10757 Leaves digitate quinate obovate mucro. entire, Spikes axillary dense
10758 Leaves digitate quinate very narrow, Spike few-flowered, Pods ovoid
10759 Leaves 3 lanc. Spikes obl. Bractes with long points, Pods round rugose
10760 Leaves pinnated of 5 pairs, Leaflets linear lanceolate, Pedunc. axillary 1-fl. longer than leaf
10761 Leaves ternate, Leaflets ovate-lanceolate somewhat downy, Racemes 1-sided on long stalks
10762 Leaves ternate lanc. smooth, Spikes interrupted stalked axill. longer than leaf
10763 Leaves tern. ovate-obl. downy, Spikes interrupted stalked axill. shorter than leaf

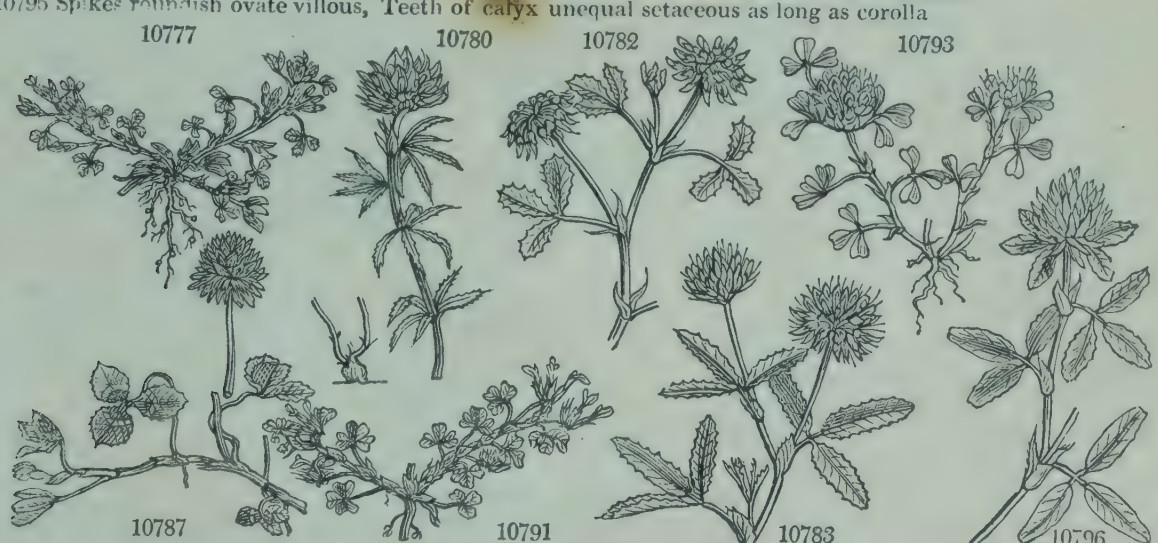
10764 Racemes obl. stalked, Stipules lanc. membranous
10765 Pods racemose naked smooth mucronate 1-seeded
10766 Pods racemose about 4-seeded oblong rugose, Leaflets ellipt. toothed

10767 Pods 1-seeded ovate acute naked rugose, Racemes shorter than leaf
10768 Pods racemose naked 2-seeded lanceolate
10769 Pods racemose naked rugose 1-seeded, Stems and branches ascending, Leafl. linear
10770 Pods racemose naked 2-seeded somewhat rugose acute, Stipules toothed at base
10771 Pods racemose naked 2-seeded rugose acute, Stipules lanc. subulate undivided
10772 Pods racemose naked 1-seeded rugose obovate acute, Stipules setaceous
10773 Pods racemose naked 2-seeded smoothish ovate acute compressed, Stipules toothed
10774 Pods racemose naked 1-seeded rugose obovate, Stipules setaceous
10775 Pods racemose naked 2-seeded rugose blunt, Leaflets entire
10776 Pods racemose naked 2-seeded membranous oval, Stem nearly erect
10777 Pods naked 8-seeded about 3 times as long as calyx, Stems declinate
10778 Pods 1-seeded obovate blunt naked rugose, Racemes longer than leaf, Stems diffuse

10779 Pods racemose naked compressed 1-seeded nerved hooked, Stipules subulate

10780 Heads halved, Leaves quinate sessile

10781 Heads in fruit reflexed, Pods 3-seeded
10782 Heads umbelled: in fruit reflexed, Pods 4-seeded, Stem angular with furrows flexuose
10783 Heads globose, Pods 2-seeded, Cal. the length of corolla, Leafl. serrulate, Stipules rhomboid
10784 Heads umbelled, Pods 4-seeded, Teeth of cal. nearly equal, Leafl. ovate-obl. emarg. serrulate
10785 Heads umbelled stalked, Teeth of cal. subulate equal, Leafl. obcord. serrate
10786 Heads umbelled, Pods 4-seeded, Teeth of calyx equal, Leafl. obovate blunt serrated
10787 Heads umbelled, Pods 4-seeded, Teeth of calyx nearly equal, Leafl. ovate obl. emarg. serrulate
10788 Heads in globose umbels imbricated, Standards deflexed persistent, Pods 4-seeded
10789 Heads umbelled, Scape naked, Pods 2-seeded pendulous, Leaves linear lanc.
10790 Heads umbelled, Pods 2-seeded, Teeth of cal. unequal, Leafl. obovate blunt toothed
10791 Heads villous 5-flowered, Central tuft reflexed rigid wrapping up the fruit
10792 Heads villous globose, Upper calyxes without florets
10793 Heads villous globose terminal solitary, Teeth of calyx setaceous longer than corolla
10794 Heads villous globose terminal solitary, Teeth of calyx setaceous shorter than corolla
10795 Heads subglobose hispid, Teeth of calyx subulate as long as cor. Leafl. obovate retuse
10796 Spikes roundish ovate villous, Teeth of calyx unequal setaceous as long as corolla



and Miscellaneous Particulars.

some soils will call into action clover-seeds, which it would appear have lain dormant for ages. At least this appears the most obvious way of accounting for the well-known appearance of white clover in such cases.

The climate most suitable for the clovers, as of most plants natives of Europe, is one neither very hot nor very dry and cold. Most leguminous plants delight both in a dry soil and climate, and warm temperature; and the clover will be found to produce most seed under such circumstances; but as the production of seed is only in some situations an object of the farmer's attention, a season rather moist, provided it be warm, is always attended by the most bulky crops of clover herbage.

The time of sowing seeds is generally the spring, during the corn-seed time, or from February to May; but they may also be sown from August to October; and when they are sown by themselves, that is, unaccompanied by any corn crop, this will be found the best season, as the young plants are less liable to be dried up and impeded in their progress by the sun, than when sown alone in spring, and remaining tender and unshaded during the hot and dry weather of July.

The manner of sowing is almost always broad-cast. When sown with spring corn, clover and grass-seeds are usually put in immediately after the land has been pulverized by harrowing in the corn-seed, and are themselves covered by one course more of the harrows; or, if the corn is drilled, the small seeds are sown immediately before or after hand-hoeing; and the land is then finished by a course of the harrows.

In the operation of sowing, some consider it best to sow the clover and rye-grass separately, alleging that that the weight of the one seed and lightness of the other, are unfavorable to an equal distribution of both.

History, Use, Propagation, Culture,

The quantity of seed varies from eight to fourteen pounds per acre, according to the intention of the crop, the quantity of grass-seeds sown, &c. The after culture of clover and rye-grass consists chiefly of picking off any stones or rather hard bodies which may appear on the surface in the spring succeeding that in which it was sown, and cutting out by the roots any thistles, docks, or other large grown weeds. After this, the surface should be rolled once to smooth it for the scythe. This operation is best performed in the first dry weather of March. Some give a top-dressing of soot, gypsum, common lime, peat, or wood-ashes, at this time or earlier; gypsum has been particularly recommended as a top-dressing for clovers and the other herbage legumes, because as their ashes afford that substance in considerable quantities, it appears to be a necessary ingredient of their food.

The taking of the clover, or clover and rye-glass crop, is either by cutting green for soiling, by making into hay, or by pasturing. It is observed in *The Code of Agriculture*, that it is a most important point to ascertain, in what cases cutting or feeding is most beneficial. If fed, the land has the advantage of the dung and urine of the pasturing stock; but the dung being dropt in irregular quantities, and in the heat of summer, when it is devoured by insects, loses much of its utility. If the dung arising from the herbage, whether consumed in soiling, or as hay, were applied to the land in one body and at the proper season, the operation would be more effectual. The smother of a thick crop, continued for any time upon the ground, greatly tends to promote its fertility; and it has been pretty uniformly found, after repeated trials, upon soils of almost every description, that oats taken after clover that has been cut, either for soiling or hay, is superior to the crop taken after clover pastured by sheep.

The produce of clover-hay, without any mixture of rye-grass, on the best soils, is from two to three tons per acre, and in this state in the London market it generally sells twenty per cent. higher than meadow-hay, or

and Miscellaneous Particulars.

clover and rye-grass mixed. The weight of hay from clover and rye-grass varies according to the soil and the season, from one to three tons per English acre, as it is taken from the tramp-ricks; but after being stacked, and kept till spring, the weight is found to be diminished twenty-five or thirty per cent.

The value of clover and rye-grass hay, in comparison with the straw of beans or pease, may be in the proportion of three to two; and with the finest straw of corn crops, in the proportion of two to one. One acre of red or broad clover will go as far in feeding horses or black cattle, as three or four of natural grass. And when it is cut occasionally, and given to them fresh, it will probably go still much farther, as no part of it is lost by being trod down.

The saving of clover seed is attended by considerable labor and difficulty. Clover will not perfect its seeds, if saved for that purpose early in the year; therefore it is necessary to take off the first growth either by feeding or with the scythe, and to depend for the seed on those heads that are produced in the autumn.

The produce in seed may generally be from three to four or five bushels per acre, when perfectly clean, weighing from two to three hundred weight. But there is great uncertainty in the produce of clover-seed, from the lateness of the season at which it becomes ripe; and the fertility of the soil is considerably impaired by such a crop. Yet the high value of the seed is a great inducement to the saving of it, in favorable situations.

T. incarnatum is sometimes sown as a border flower.

1601. *Lotus.* Λωτος, in Greek. There were three sorts of Lotus distinguished by the ancients; viz. their *tree* lotus, which was our Zizyphus lotus; the *marsh* lotus, which was our Nymphæa lotus; and the *herbaceous* lotus, which appears to have been the present genus.

The pods of L. edulis are still eaten in Candia, by the poorer inhabitants. Lotus rectus has by some been

History, Use, Propagation, Culture,

supposed the Cytisus of Virgil, but, as other contend, without sufficient foundation. Lotus jacobæus is a valuable greenhouse plant, as flowering all the year. L. major and corniculatus are very suitable to sow with deal in their favor; Miller is against them; but Sinclair, in his work on the British Grasses, found it a valuable ingredient in meadows, especially where the soil was rather moist. (*See Ency. of Agr.* p. iii. b. 6.) *Gebelia* is the Arabic name (*Gébélié*) of the species to which it has been applied.

1602. *Tetragonolobus.* From τετρας, four, γωνια, an angle, and λοβος, a bean, in allusion to the four wings of the pods. Tetragonolobus edulis is now a popular border annual, on account of its curious pods; but it was formerly an esculent legume, these pods being used like those of the kidney bean, by the poor of Sicily and Spain.

1603. *Trigonella.* From τρεις, three, and γωνια, an angle. The standard of the flower is flat, and the keel very small and narrow, which gives the flower a triangular appearance. T. fœnum-græcum, a plant cultivated by the Romans, is still occasionally employed in the agriculture of the south of Europe. The seeds have a strong

10877 Pods sessile about 3 linear nearly erect, Leaves truncate cuneate pinnatifid toothed
10878 Pods sessile straight nearly erect a little falcate acuminate
10879 Racemes stalked, Common pedunc. longer than leaf, Pods linear falcate heaped pendulous
10880 Pods sessile subsolitary subfalcate, Leaflets entire
10881 Pods stalked longer than leaf, Leaves streaked
10882 Pods stalked umbelled erect incurved, Leafl. cuneate serrate, Stem much branched
10883 Pods about 4 arcuate erect, Pedunc. unarmed: when in flower as long as leaf, Leafl. cuneate
10884 Pods about 6 arcuate erect wavy torulose, Pedunc. unarmed: when in fl. longer than leaf, Leafl. cuneate
10885 Pods stalked heaped declinate falcate furrowed, Pedunc. awned longer than leaf
10886 Pedunc. very short spiny, Pods short curved upwards
10887 Pods subsessile nearly erect falcate acuminate downy, Stem spreading

10888 Leafl. linear lanc. acute, Teeth of calyx ovate
10889 Leafl. obate blunt, Teeth of calyx ovate

and Miscellaneous Particulars.

disagreeable smell, and an unctuous farinaceous taste, accompanied with a slight bitterishness. An ounce renders a pint of water thick and slimy. To rectified spirit, they give out the whole of their distinguishing smell and taste, and afterwards to water a strong flavorless mucilage. These seeds are never given internally, their principal use being in cataplasms and fomentations, for softening, maturating, and dispersing tumours; and in emollient glysters. They were also an ingredient in the *oleum e mucilaginibus;* but this has no longer a place in the pharmacopæia. (*Woodville* and *Lewis.*) They are used by grooms and farriers for horses. Fenugreek has not been cultivated in any quantity for use in England, because it is an uncertain crop, occasioned by the inconstancy of our weather.

1604. *Dorycnium.* The Greek name of an herb, supposed to be the Convolvulus Dorycnium of the moderns. The plant now called by the name has no resemblance to that of the ancients. D. hirsutum is a beautiful half-hardy shrub, well deserving cultivation.

History, Use, Propagation, Culture,

1605. *Medicago.* A native of the country of the *Medes*, whence this plant was brought to Greece during the expedition of Darius. M. arborea, the Cytisus of the ancients, flowers great part of the year, and when sheltered is seldom destitute of flowers. In the open air it begins to flower in April, and continues till December. Those flowers which appear early in summer, will have the seeds ripe in August, or the beginning of September, and the others will ripen in succession. It grows in great plenty in Abruzzo, and many parts of the kingdom of Naples, where the goats feed upon it; and with their milk abundance of cheese is made there. It also abounds in several of the islands in the Archipelago, where the Turks use the wood to make handles for their sabres; and the caloyers, or Greek monks, form their beads of it. In old shrubs, the heart is of a dark color, and hard like ebony.

According to Miller, this shrub bids the fairest of any to be the Cytisus of Virgil, Columella, and the other ancient writers on husbandry; and being celebrated by them as an excellent fodder, has been recommended for cultivation here. But however useful it may be in Candia, Rhodes, Sicily, Abruzzo, and other dry warm countries, yet it will never thrive in England, (where we have also many plants of this leguminous tribe far more succulent than this,) so as to be of any real advantage; for in severe frost it is very subject to be destroyed, or at least so much damaged, as not to recover its former verdure before the middle or end of May; (and even after a mild winter, it will generally appear injured by our cold spring winds, even at that season; so that it cannot be of any use here for early spring fodder.) Besides, the shoots will not bear cutting above once in a summer, and then will not be of any considerable length: and the stems growing very woody, the cutting of it will be very troublesome. Upon the whole, therefore, it is not worth the trial; though in hot, dry, rocky countries, where few other plants will thrive, it may be cultivated to great advantage. But, however unfit Tree Medick may be for use as fodder in England, yet for the beauty of its hoary leaves, abiding all the year, together with its long continuance in flower, it deserves a place in every good garden and plantation, with shrubs of the same growth. (*Dict. in loco, and Martyn's Virgil.*)

M. sativa, *Foin de Bourgogne*, Fr., *Alfalfa*, Span., and *Lucerne*, Eng., (from the Languedoc pâtois *Lauserda*), is a deep rooting perennial plant, sending up numerous small and tall clover-like shoots, with blue or violet spikes of flowers. It is highly extolled by the Roman writers; it is also of unknown antiquity in old Spain, Italy, and the south of France; is much grown in Persia and Peru, and mown in both countries all the year round. It is mentioned by Hartlib, Blythe, and other early writers, and was tried by Lisle; but it excited little attention till after the publication of Harte's Essays, in 1757. But though it has been so much extolled, it has yet found no great reception in this country. If any good reason can be given for this, it is, that lucern is a less hardy plant than red clover, requires three or four years before it comes to its full growth, and is for these and other reasons ill adapted to enter into general rotations. When the climate and soil suit, perhaps, a field of it may be advantageously sown, adjoining the homestall, to afford early cutting or food for young or sick animals, for which it is said to be well adapted; but though it will produce good crops for eight or ten years, yet from the time the farmer must wait till this crop attains its perfection, and from the care requisite to keep it from grass and weeds, we do not think it is ever likely to come into general culture.

There are no varieties of the lucern deserving the notice of a cultivator. What is called the yellow lucern, or Swiss lucern, is the Medicago falcata, a much more hardy and coarser plant, common in several parts of England, but not cultivated any where excepting in some poor soils in Switzerland.

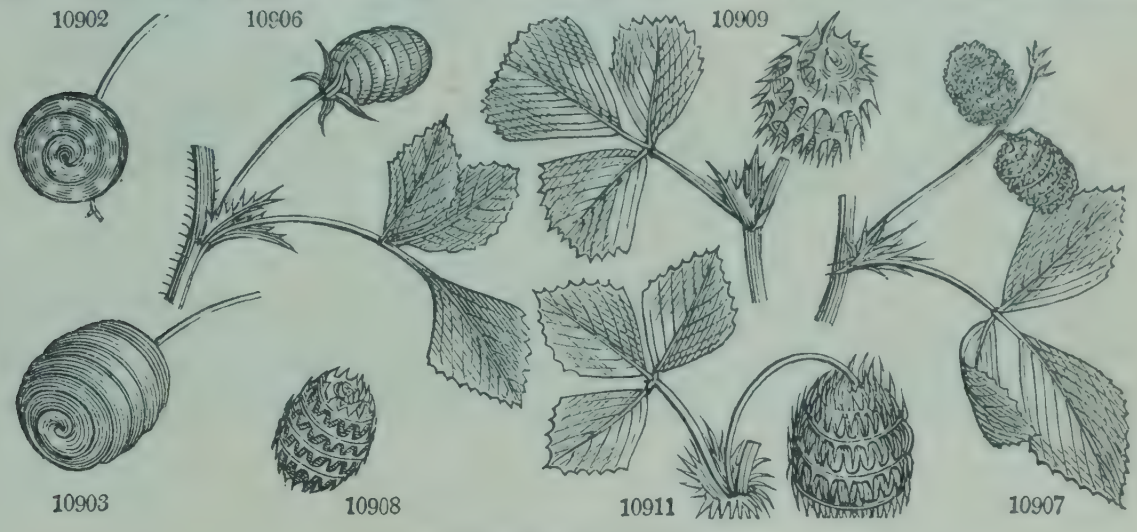
10916 Pedunc. many-fl. Pods cochleate flat at each end with 3 netted folds muricate at edge
10917 Pedunc. about 2-fl. Pods cochleate cylindr. flat at each end with smooth lanc. distich. close-pressed prickles



and Miscellaneous Particulars.

The soil for lucern must be dry, friable, inclining to sand, and with a subsoil not inferior to the surface; unless the soil be good and deep, it is in vain to attempt to cultivate lucern.

The preparation of the soil consists in deep ploughing and minute pulverisation; and, in our opinion, the shortest way to effect this, is to trench it over by the spade to two or three feet in depth, burying a good coat of manure in the middle, or at least one foot from the surface. This is the practice in Guernsey, where lucern is highly prized.

The climate for lucern, as we have already hinted, must be warm and dry; it has been grown in Scotland and Ireland, and might probably do well in the southern counties of the latter country, but in the former it has not been found to answer the commendations of its admirers.

The season most proper for sowing lucern, is as early as can be done in the spring months, as in this way the plants may be fully established before the season becomes too hot. If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed-bed as early in the spring as the frosts will admit, in order that they may be strong, and fit to set out about the beginning of August.

The manner of sowing lucern is either broad-cast or in drills, and either with or without an accompanying crop of corn for the first year. Broad-cast, and a very thin crop of barley or other spring corn, is generally, and, in our opinion, very properly preferred.

The quantity of seed, when the broad-cast method is adopted, is said to be from fifteen to twenty pounds per acre, and from eight to twelve if drilled. The seed is paler, larger, and dearer than that of clover; it is generally imported from Holland, and great care should be had to procure it plump and perfectly new, as two years old seed does not come up freely. The same depth of covering as for clover will answer.

The after-culture of lucern, sown broad-cast, consists in harrowing, to destroy grass and other weeds; rolling, after the harrowing, to smooth the soil for the scythe, and such occasional top-dressings of manure as the state of the plants may seem to require.

The top-dressings given to lucern may be either of the saline or mixed manures. Ashes are greatly esteemed, and also gypsum and liquid manure of any kind.

The taking of lucern by mowing for soiling, or hay, or by tethering, hurdling, or pasturing, may be considered as the same as for clover. Lucern frequently attains a sufficient growth for the scythe towards the end of April, or beginning of the following month; and in soils that are favorable for its culture, will be in a state of readiness for a second cutting in the course of a month or six weeks longer, being capable of undergoing the same operation at nearly similar distances of time during the whole of the summer season.

The application of lucern is also the same as of clover. The principal and most advantageous practice, in the application of lucern, is that of soiling horses, neat cattle and hogs; but as a dry fodder, it is also capable of affording much assistance, and as an early food for ewes and lambs, may be of great value in particular cases. All agree in extolling it as food for cows, whether in a green or dried state.

The produce of lucern, cut three times in a season, has been stated at from three to five and even eight tons per acre. In soiling, one acre is sufficient for three or four cows during the soiling season, and a quarter of an acre, if the soil be good, for all sorts of large stock, for the same period, or half an acre on a moderate soil.

The nutritive product of lucern, according to Sir H. Davy, is 2-3-tenths per cent., and is to that of the

clovers and saintfoin as 23 to 39. This result does not very well agree with the superior nutritive powers attributed to lucern; and is one proof, among many, how little the analysis of the chemist agrees with the experience of the farmer.

To save seed, the lucern may be treated precisely as the red clover, and it is much easier threshed, the grains being contained in small pods, which easily separate under the flail, or a threshing machine, or clover mill.

M. lupulina, Hop-trefoil, sometimes called Shamrock, and in Norfolk Black Nonesuch, is cultivated occa-

sionally along with the perennial clovers, and sometimes confounded with the common yellow clover, which is an annual and much smaller plant. Its treatment is the same as that of white clover; but its herbage is little relished by cattle, and both it and the yellow clover are going fast out of repute.

M. scutellata and intertexta are sown as border flowers for the curiosity of their pods.

1606. *Hymenocarpus.* From ὑμὴν, a membrane, and καρπος, fruit, in allusion to the membranous texture of the pods. Little inconspicuous plants resembling Trifolium.

Class XVIII. — POLYADELPHIA. Stamens united into several parcels.

One of the smallest of the Linnean classes, characterized by the cohesion of the filaments in several parcels. It almost wholly consists of plants remarkable either for their beauty or importance otherwise. From the Theobroma the nutritious substance which forms the basis of Chocolate is procured. Melaleuca and its allies are among the most elegant of New Holland plants. The genus Symplocos contains a plant useful as a dye. To Citrus belong the Orange, Lemon, Lime, and all their delicious varieties; and the Loasa, with which the class is here concluded, consists of some of the most ornamental and curious of our garden annuals.

By some botanists this class is distributed among others, especially Icosandria and Polyandria.

Order 1. DECANDRIA. Stamens 10 or 12.

1607. *Theobroma.* Cal. 5-leaved. Petals 5, fornicate. Nectary urceolate, with 5 horns. Filaments 5, each with 2 anthers. Style filiform. Stigma 5-parted. Caps. 5-celled, without valves. Seeds in a buttery pulp.

1608. *Bubroma.* Cal. 3-leaved. Petals 5, 2-horned. Nect. campanulate, 5-fid. Filam. 5, attached to the outside of nectary; each with 3 anthers. Style simple. Capsule woody, warted, valveless, bored with 12 rows of holes.

History, Use, Propagation, Culture,

1607. *Theobroma.* From Θεος, God, and βρωμα, food, in allusion to the excellent nature of its produce. The Mexicans call the beverage obtained from it *Chocolatl.* (*Nieremb.*) T. Cacao is a tree which grows in a very handsome form to the height of twelve or sixteen feet; the trunk is upright, and about as high as a man before the head spreads out; the wood is light and of a white color; the bark brownish. Leaves lanceolate-oblong, bright green, quite entire; flowers small, reddish, inodorous. Fruits smooth, yellow, red, or of both colors, about three inches in diameter: rind fleshy, near half an inch in thickness, flesh-colored within: pulp whitish, the consistence of butter, separating from the rind in a state of ripeness, and adhering to it only by filaments, which penetrate it and reach to the seeds. Hence it is known when the seeds are ripe, by the rattling of the capsule when it is shaken. The pulp has a sweet and not unpleasant taste, with a slight acidity; it is sucked and eaten raw by the natives. The seeds are about twenty-five in number: when fresh they are of a flesh-color: gathered before they are ripe, they preserve them in sugar, and thus they are very grateful to the palate: they quickly lose their power of vegetation, if taken out of the capsule; but kept in it, they preserve that power for a long time. The tree bears leaves, flowers, and fruit all the year through; but the usual seasons for gathering the fruit are June and December. In two years from the seed it is above three feet high, and spreads its branches, not more than five of which are suffered to remain: before its third year is complete it shows for fruit. A tree yields from two to three pounds of seeds annually. These seeds are remarkably nourishing, and agreeable to most people; which occasions them to be commonly kept in most houses in America, as a necessary part of the provisions of the family: they are generally ground or pounded very fine, a little arnatto added, and made into paste: they are much charged with oil, but mix well with milk or water, and are formed into rolls of one pound each.

This simple preparation of chocolate is the most natural and the best. It is in daily use amongst most

1609. *Abroma.* Cal. 5-part. Petals 5, with saccate dilated claws Cup of stamens 10-fid; with 5 segments, each bearing 3 anthers; the other 5 petaloid. Styles 5. Caps. 5-celled, 5-winged, many-seeded.

Order 2. POLYANDRIA. Stamens indefinite.

1610. *Melaleuca.* Parcels of stamens 5, opposite the petals, long; anthers incumbent. Caps. 3-celled, many-seeded, connate, and included in the thickened tube of the calyx which is grown to the branch.
1611. *Tristania.* Parcels of stamens 5, opposite the petals, and scarcely longer than they are; anthers incumbent. Caps. 3-celled, many-seeded, united with the turbinate stalked tube of the calyx.
1612. *Calothamnus.* Parcels of stamens 4-5, opposite the petals (some either connate or sterile). Anthers inserted by the base, entire. Caps. 3-celled, many-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch.
1613. *Beaufortia.* Parcels of stamens 5, opposite the petals. Anthers inserted by the base, bifid at the end, with deciduous lobes. Caps. 3-celled, 1-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch.
1614. *Symplocos.* Cal. 5-fid, superior. Petals 5-8; cohering at the base in a tube. Stamens united to the corolla in 4 rows. Drupe dry, 5-celled.
1615. *Citrus.* Cal. 5-fid. Petals 5, oblong. Anthers 20; the filaments variously divided. Berry 9-celled.
1616. *Xanthochymus.* Cal. 5-leaved. Petals 5. Nectaries 5. Stamens united in 5 parcels. Apple 1-5-seeded.
1617. *Hypericum.* Cal. 5-parted. Petals 5. Filaments many in 3 or 5 parcels. Capsule superior.
1618. *Ascyrum.* Cal. 4-leaved. Petals 4. Caps. 1-celled, 2-3-valved.
1619. *Loasa.* Cal. 5-leaved. Petals 5. Nectary 5-leaved. Caps. $\frac{1}{2}$-inferior, 1-celled, $\frac{1}{2}$-3-valved, many-seeded.

DECANDRIA.

10933 Leaves entire smooth
10934 Leaves acuminate repand-toothed downy beneath

10935 Leaves cordate ovate acute with unequal serratures

10936 Leaves 7-angled : floral ov.-lanc. acuminate somewhat toothed, Pedunc. axill. Branches unarmed

and Miscellaneous Particulars.

families in Jamaica, where the tree is largely cultivated, and affords a nutritious food for children, as well as adults. But as chocolate made abroad cannot by law be imported into this country, consequently all chocolate consumed in Britain ought to be made here. It is composed principally of the kernel of the cocoa, as above mentioned; but the art is in very few hands: and we believe that a small portion of soap is added to most British chocolate, in order to cause it to froth when it is dissolved in hot water.

Cocoa is a simple preparation made in Britain, from the cocoa-nut, or from the shells of it, or from a mixture of both. It is considered much easier of digestion than chocolate, and very nourishing.

In our stoves Theobromas thrive in light rich soil, and cuttings root in sand under a hand-glass.

1608. *Bubroma.* In contradistinction to Theobroma; from βους, an ox, and βρωμα, food, as if producing a substance fit only to be eaten by cattle. *Orme d'Amerique*, Fr. A wide spreading tree, not unlike the Elm, with oblong heart-shaped leaves, which sleep hanging quite down, whilst the petioles remain entirely stiff and straight. It grows in the lowlands of Jamaica, forming a very agreeable shade for the cattle, and supplying them with food in dry weather, when all the herbage is burned up or exhausted. The seeds are very mucilaginous, but otherwise agreeable to the palate. The wood is light, and so easily wrought, that it is generally used by coachmakers in all the side pieces. (*Browne.*) It is also frequently cut into staves for casks. A decoction of the inner bark is very glutinous, and very like that of the elm. In our stoves it thrives well in a loamy soil, and cuttings root freely in sand under a hand-glass.

1609. *Abroma.* Still named with reference to the two preceding genera, from α, privative, and βρωμα, food; as if unfit for either gods or oxen. This, Sweet observes, "is a hardy stove genus, and easily managed; the species flower freely at various seasons, and will grow in the common garden soil: but a mixture of good loam with a little peat is an excellent compost for them. They propagate freely by seeds and cuttings." (*Bot. Cult.* 10.)

History, Use, Propagation, Culture,

1610. *Melaleuca.* From μελας, black, and λευκος, white: because the original tree has black wood and white branches. A beautiful Australasian genus, which grows and flowers freely in equal parts of sandy loam and peat, with common greenhouse treatment. "Some cultivators," Sweet observes, "grow them entirely in peat, in which they will grow very well for a time; but they will not be strong and healthy, nor flower so well as in a mixture. Ripened cuttings, not too old, will root freely in sand under a bell-glass." (*Bot. Cult.* 223.)

The bark of Melaleuca Leucadendron is used by the Chinese as oakum, for making good the spaces between the timbers of their vessels. They also use it in the roofing their houses. From the same tree is obtained the Cajeputi oil, remarkable for its green color, its peppermint flavor, and turpentine smell. It is rarely to be procured in Europe in an unadulterated state. When pure it is one of the best preservatives of preparations of natural history, and is used externally with much success as a cure for rheumatic affections and pains in the joints.

1611. *Tristania.* From τρεις, three, and εστημι, to stand; in allusion to the ternate disposition of the flowers and leaves. The species may be treated like Melaleuca, and are pretty little evergreen shrubs.

1612. *Calothamnus.* From καλος, beautiful, and θαμνος, a rod, in allusion to the splendid appearance of the branches covered with scarlet blossoms. The species are beautiful plants, and not difficult of culture or propagation in sand, and the air kept still and moderately moist by covering with a hand-glass.

POLYANDRIA.

10938 Leaves alternate lanc. acuminate oblique 5-nerved, Branches and petioles smooth

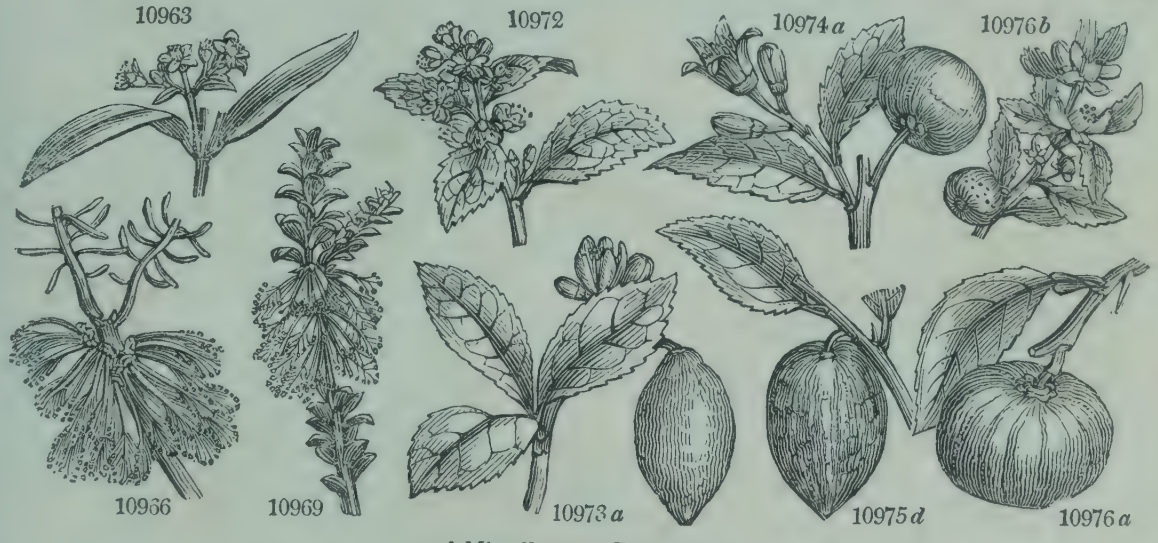
10976 Peti. winged, Lvs. ellipt. acute crenulat. Fl. 20-androus, Fruit glob. with a thin rough skin and bitter pulp



and Miscellaneous Particulars.

1613. *Beaufortia.* So called in honor of Mary, Duchess of Beaufort, who died January 7, 1714, in the 85th year of her age. She had a fine collection of plants at Badmington, in Gloucestershire, during the life-time of her husband, Henry, first duke of Beaufort. Splendid plants, free-growers, and abundant flowerers, with common greenhouse treatment, in two-thirds peat, and one-third loam. Cuttings, Sweet found to answer best when "taken from nearly ripened wood, planted in sand, and covered with a bell-glass."

1614. *Symplocos.* From συμλοχη, connection; union. The petals are naturally five, but united at the base so as to seem but one. A tree with oblong fragrant shining leaves, and sweet-smelling flowers, succeeded by subsessile drupes. A decoction of the leaves is used in North America for dying linen and silk of a bright yellow color.

1615. *Citrus.* The meaning of this word has escaped the ingenuity of etymologists. An ancient genus, combining in its species many excellencies, handsome evergreen shining tree-like forms, most odoriferous flowers, and brilliant, fragrant, delicious fruits. It is one of the most striking of fruit-bearing trees, and must have attracted the notice of aboriginal man long before other fruits of less brilliancy, but of more nutriment or flavor. The golden apples of the heathens, and forbidden fruit of the Jews, are supposed to allude to this family, though it is remarkable that we have no authentic records of any species of Citrus having been known; certainly none were cultivated by the Romans. The citron was introduced into Europe from Media, under the name of *malus medica*, and was first cultivated in Italy by Palladius, in the second century. The orange

History, Use, Propagation, Culture,

is supposed to have been introduced into Italy in the fourteenth century, above a thousand years after the citron. In England, these trees have been cultivated since 1629. Parkinson, writing at that time, says, " the orange hath abiden with some extraordinary looking and tending, when neither citron nor lemon trees could be preserved any length of time." The orange trees he alludes to were those of Beddington, in Surrey, introduced from Italy by a knight of the noble family of the Carews (*Gibson's* edit. of *Camb. Brit.*), and the first that were brought into England; they were planted in the open ground and placed under a moveable cover during the winter months. It has been said that these trees were raised by Sir Francis Carew, from seeds brought to England by Sir Walter Raleigh · but as such trees would not have readily borne fruit, Professor Martyn thinks it much more likely that they were plants brought from Italy. Bradley says, they always bore fruit in great plenty and perfection; that they grew on the outside of a wall, not nailed against it, but at full liberty to spread; they were fourteen feet high, the girt of the stem twenty-nine inches, and the spreading of the branches one way nine feet, and twelve feet another. These trees, Evelyn informs us, were neglected in his time, during the minority of their owner, and finally entirely killed by the great frost in 1739-40; they were planted before 1595.

During the latter end of the seventeenth and beginning of the eighteenth centuries, the orange tree was a very fashionable article of growth in conservatories, when there were but few exotics of other sorts kept there. The plants were procured from Genoa, with stems generally from four to six feet in height; they were planted in large boxes, and were set out during summer to decorate the walks near the house, in the manner still practised at Versailles and the Thuilleries. About the middle of the eighteenth century, when a taste for botany and forcing exotic fruits became general, that for superb orange trees began to decline; many of these large trees have decayed through neglect; and those which are now to be found in the greater number of greenhouses, are generally dwarf plants bearing few fruit, and those of small size. In some places, however, are still to be found large and flourishing trees. Those at Smorgony, in Glamorganshire, are the largest in Britain; they are planted in the floor of an immense conservatory, and bear abundantly. It is said that the plants were procured from a wreck on the coast in that quarter, in the time of Henry VII.

At Nuneham, near Oxford, are some fine old trees, planted under a moveable case, sheltered by a north wall. In summer the case is removed, and the ground turfed over, so that the whole resembles a native orange grove. At Wormleybury, Hertfordshire, and Shipley Hall, in Derbyshire, are very fine large orange and lemon trees grown in borders and in boxes. (*Hort. Trans.* vol. ii. 295, and iv. 306.)

At the Wilderness, Kent, are three trees in boxes, not surpassed by any trees so grown in Europe.

At Woodhall, near Hamilton, trees of all the species of Citrus are trained against the back walls of forcing houses, in the manner of peaches, and produce large crops of fruit.

In the south of Devonshire, and particularly at Saltcombe, one of the warmest spots in England, may be seen, in a few gardens, orange trees that have withstood the winter in the open air upwards of a hundred years. The fruit is as large and fine as any from Portugal. Trees raised from seed, and inoculated on the spot, are found to bear the cold better than trees imported.

The common character of the Citrus family is that of low evergreen trees, with ovate or oval-lanceolate, entire or serrated leaves. On the ungrafted trees are often axillary spines. The flowers appear in peduncles, axillary or terminating, and one or many-flowered. The fruits are large berries, round or oblong, and generally of a yellow color. The species seem best distinguished by the petiole, which in the orange and shaddock is winged; in the citron, lemon, and lime, naked. The form of the fruit, although not quite constant, may also serve for a distinction. In the orange and shaddock it is spherical, or rather an oblate spheroid, with a red or orange-colored rind; in the lime, spherical, with a pale rind; in the lemon, oblong, rough, with a nipple-like protuberance at the end; in the citron, oblong, with a very thick rind. The flowers of the citron and lemon have ten stamens, and those of the orange more. It is very difficult to determine what is a variety, and what is a species in this genus; many of the sorts in cultivation are by buds.

Dr. Sickler, who spent several years in Italy, and paid great attention to the kinds and culture of the orange, published in 1815, Der Vollkommen Orangerie-Gartner (The complete Orange Gardener), in which he describes above seventy sorts of Citrus.

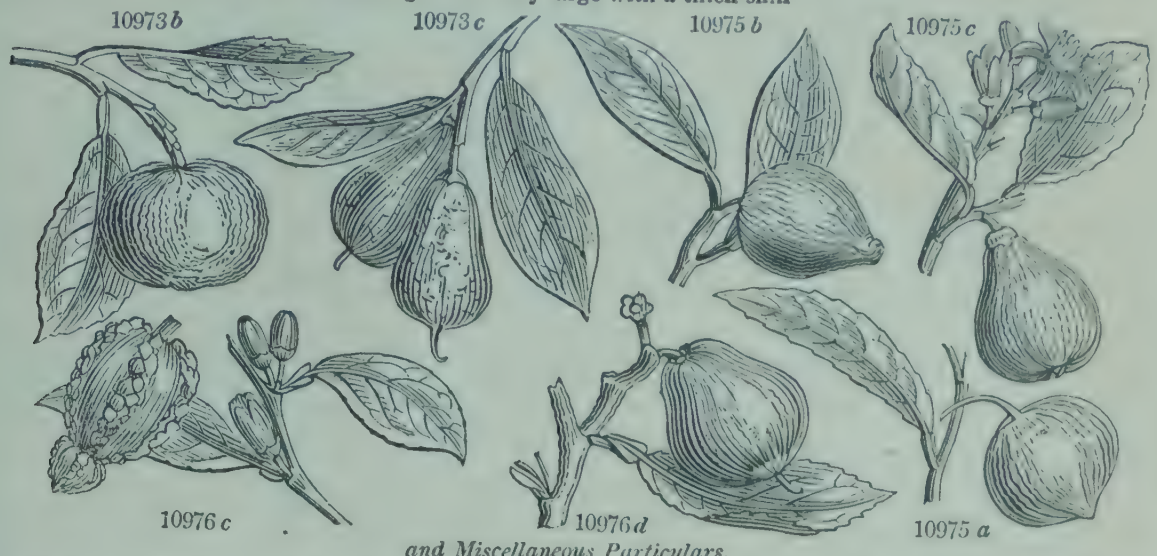
Gallesio (*Traité du Genre Citrus*, &c. Savonna, 1818.) has given a synopsis of the forty principal sorts cultivated in Italy.

The most splendid work on oranges which has yet appeared is the Histoire Naturelle des Orangers, by Risso, of Nice, and Poiteau, of Versailles. (Paris, fol. 1818.) Here 169 sorts are described, and 105 of them figured, and their French and Italian culture given at great length. They are arranged as sweet oranges, of which they describe 42 sorts; bitter and sour oranges, 32 sorts; bergamots, 5 sorts; limes, 8 sorts; shaddocks, 6 sorts; lumes, 12 sorts; lemons, 46 sorts; citrons, 17 sorts.

All the species of Citrus endure the open air at Nice, Genoa, and Naples; but at Florence and Milan, and often at Rome, they require protection during the winter, and are generally placed in conservatories and sheds. The largest conservatory in Italy is that of Prince Antonio Borghese, at Rome, which contains seventy select sorts of *agrumi*. The largest trees are at Sorenta, Terracina, Gaeta, and Naples; but the most regular and garden-like culture of the orange, is in the orange-orchards at Nervi, Monaco, and other places in the neighbourhood of Genoa. At Nervi are also the orange nurseries which may be said to supply all Europe with trees; they are, in general, wretchedly cultivated, and the stocks inoculated in the most unscientific manner; but the fine climate, strong clayey soil, and abundant manurings, supply in a great degree the nicer practices

10977 Petioles lin. very short, Lvs. ovate retuse, Flowers racemose
10978 Petioles sublinear straight, Branches ascending unarmed, Fruit depressed, Skin separated from flesh

10979 Petioles naked, Lvs. obl. acute, Fl. 40-androus, Fruit obl. rugose with acid pulp
10980 Petioles winged, Lvs. blunt emarg. Fruit very large with a thick skin



and Miscellaneous Particulars.

of gardening. There the names of varieties vary as much as those of gooseberries do in England; but from upwards of 180 names, not above 40 distinct sorts can be procured. Good plants of the Maltese and other varieties of orange may be procured from Malta; and some sorts also from Lisbon. From the nurseries at Paris about thirty sorts may be obtained, much smaller plants than those from the other places named, but more scientifically grafted or inoculated. The catalogues of London nurserymen enumerate above thirty varieties of oranges, twelve of lemons, and several varieties of the other species; the plants are partly Genoese, partly French, and partly propagated here.

The C. aurantium, the common orange; *orange*, Fr., *pomoranze*, Ger., and *arancio*, Ital., is a middle-sized evergreen tree, with a greenish-brown bark; and, in its wild state, with prickly branches. The fruit is nearly round, from two to three inches in diameter, and of a gold color. It is now cultivated in most countries of Europe; in the open air in Italy and Spain; and in conservatories or greenhouses in Britain and the north of Europe.

The two principal varieties are the sweet or China orange, the *orange douce* of the French, and *porto-gallo* or *poma de sino* of the Italians; and the bitter or Seville, the *bigarade* of the French, and *arancio volgaro* of the Italians. The Maltese orange, distinguished by its red pulp, is also a noted and much-esteemed sort. The box-leaved, willow-leaved, and some others, are cultivated more as curious varieties than for their fruit.

C. Medica, the citron, *citron*, Fr., *citronier*, Ger., and *cedrate*, Ital., in its wild state grows to the height of about eight feet, erect and prickly, with long reclining branches. The leaves are ovate, oblong, alternate, subserrate, smooth, pale green. The fruit or berry is half a foot in length, ovate, with a protuberance at the lip. There are two rinds, the outer thin, with innumerable miliary glands, full of a most fragrant oil; the inner thick, white, and fungous.

In China they have a variety of the C. Medica, of very considerable size, quite solid, with scarcely any pulp or cells, and divided at the end into five or more long round lobes, on which account it is called *Phat thu*, or finger-orange. The fruit is laid upon fine porcelain vessels in the sitting-rooms of the Chinese, for the sake of its agreeable perfume.

Dr. Sickler enumerates only about a dozen citrons and citronates as grown in Italy. The French nurseries have nearly twenty names in their lists. In England six are cultivated for sale.

C. Limonum, the lemon; *limon*, Fr., *limonier*, Ger., and *limone*, Ital., has the fruit less knobbed at the extremities, is rather longer and more irregular, and the skin is thinner than in the citron; the wood is more knotty, and the bark rougher.

Dr. Sickler enumerates twenty-eight varieties as grown in Italy. The French, according to Ville Hervé have eleven sorts; in the London nurseries are cultivated twelve.

C. Limetta, the lime, by some esteemed a variety of the C. Medica, *lime*, Fr., Ital., and Ger., grows to the height of about eight feet, with a crooked trunk, and many diffused branches, with prickles. The leaves are ovate lanceolate, almost quite entire. Berry an inch and a half in diameter, almost globular, with a protuberance at the top; the surface regular, shining, greenish-yellow, with a very odorous rind, enclosing a very acid juice.

The French have two sorts of lime; and, according to Dr. Sickler, the Italians have four varieties; five kinds are grown in the London nurseries.

C. decumana, the shaddock, *orange pampelmouse*, Fr., *arancio massimo*, Ital., is above the middle size, with spreading prickly branches. The leaves are ovate, subacute, seldom obtuse; the petioles are cordate, winged; the wings as broad as the leaves. The berry spheroidal, frequently retuse at each end, of an even surface, and greenish yellow color; pulp red or white; juice sweet or acid; rind white, thick, fungous, and bitter. Thunberg says, the fruit in Japan grows to the size of a child's head, and Dr. Sickler states its weight as fourteen pounds, and its diameter as from seven to eight inches. It is a native of China and Japan, and was brought to the West Indies by Captain Shaddock, from whom it has derived its name.

The Italians, according to Dr. Sickler, have one, and the French, according to the Nouveau Cours, &c., four sorts. Four are grown in the English nurseries.

All the sorts may be propagated by seeds, cuttings, layers, and grafting, or inoculation.

The object of raising plants from seed is either to obtain new varieties or stocks for grafting. To attempt raising new varieties in Britain will in general be found a tedious process, as the trees do not even in Italy show fruit for six or eight years or more; and there is now in the botanic garden at Toulon, a large handsome tree, of twenty-five years' growth, which in 1819 had not blossomed. Shaddock stocks are the strongest, and next to these the citron. Budding and grafting are performed at the usual season; but these operations may be performed at any time when the sap is in motion.

Henderson, of Woodhall, a most superior cultivator of the Citrus tribe, considers cuttings as the quickest mode of getting plants, and has practised it for thirty-seven years past: his directions are as follows: "Take the strongest young shoots, and also a quantity of the two years old shoots; these may be cut into lengths from nine inches to eighteen inches. Take the leaves off the lower part of each cutting to the extent of about five inches, allowing the leaves above that to remain untouched: then cut right across, under an eye; and make a small incision in an angular direction on the bottom of the cutting. When the cuttings are thus prepared, take a pot, and fill it with sand; size the cuttings, so that the short ones may be all together, and those that are taller in a different pot. Then, with a small dibble, plant them about five inches deep in the sand, and give them a good watering overhead, to settle the sand about them. Let them stand a day or two

History, Use, Propagation, Culture,

in a shady place, and if a frame be ready with bottom heat, plunge the pots to the brim. Shade them well with a double mat, which may remain till they have struck root; when rooted, take the sand and cuttings out of the pot, and plant them into single pots, in the proper compost. Plunge the pots with the young plants again into a frame, and shade them for four or five weeks, or till they are taken with the pots; when they may be gradually exposed to the light. From various experiments, I found that pieces of two year old wood struck quite well; and in place, therefore, of putting in cuttings six or eight inches long, I have taken off cuttings from ten inches to two feet long, and struck them with equal success. Although I at first began to put in cuttings only in the month of August, I now put them in at any time of the year, except when the plants are making young wood. By giving them a gentle bottom heat, and covering them with a hand-glass, they will generally strike root in seven weeks or two months. The citron is most easily struck, and is the freest grower; I, therefore, frequently strike pieces eighteen inches long, and as soon as they are put into single pots, and taken with the pots, they are grafted with other sorts, which grow freely. I am not particular as to the time either of striking cuttings or of grafting." (*Caled. Hort. Mem.* iii. 308.)

At Genoa and Florence, citrus trees are grown in a strong yellow clay, which is richly manured; and this soil is considered by the first Italian gardeners as best suited to their natures.

The French gardeners, in preparing a compost for the orange-tree, endeavour to compensate for quantity by quality; because the pots or boxes in which the plants are placed ought always to be as small as possible, relatively to the size of the tree. The following is the composition recommended: to a fresh loam, which contains a third of clay, a third of sand, and a third of vegetable matter, and which has lain a long time in a heap, add an equal bulk of half-rotten cow-dung. The following year turn it over twice. The succeeding year mix it

10981 Leaves oblong
10982 Leaves smaller oval blunt

* *Sepals entire.*
11004 Stem herbaceous square erect, Leaves distant long ovate amplexicaul sinuated at edge acute not dotted
11005 Stem round black dotted, Leaves ovate-lanc. somewhat acute amplexicaul dotted with black
11006 Stem erect purple, Leaves lin. lanc. reflexed with pellucid dots, Flowers corymbose
11007 Stem procumbent square herbaceous, Leaves linear-lanceolate blunt revolute at edge with pellucid dots
11008 Stem round straight, Leaves amplexicaul. blunt ovate revolute at edge, Styles united
11009 Stem straight square, Leaves ovate-lanceol. slightly amplexicaul. dotted with black revolute at edge
11010 Stem round, Leaves ovate cordate amplexicaul. or cuneate lanc. revolute at edge
11011 Stem round, Branches angular, Lvs. linear lanc. revolute at edge with pellucid dots, Styles often united
11012 Stem round, Leaves cordate amplexicaul. blunt revolute at edge glaucous with pellucid dots
11013 Flowers trigynous, Styles united, Lvs. ovate subamplex. Sepals ov. acute, Middle flower of panicle sessile
11014 Stem square and winged, Leaves ovate obl. blunt needle-dotted not pellucid, Panicle naked
11015 Styles 3, Stem herbaceous 4-angular somewhat branched, Leaves ovate with pellucid dots, Cal. lvs. lanc.
β Stem obsoletely quadrangular, Leaves elliptical ovate obtuse destitute of pellucid dots, Cal. lvs. elliptical

11016 Stem round dotted with black, Leaves ovate obl. blunt amplexicaul. dotted with black
11017 Stem weak square smooth, Leaves ovate subcordate blunt revolute at edge scarcely dotted beneath

and Miscellaneous Particulars.

with nearly one-half its bulk of decomposed horse dung. Turn it over twice or three times, and the winter before using add a twelfth-part of sheep dung, a twentieth of pigeon dung, and a twentieth of dried ordure.

Henderson, already mentioned, takes one part of light-brown mould from a piece of ground that has not been cropped nor manured for many years; one part of peat earth, such as is used for growing heaths; two parts of river sand, or pit sand, if it be free from mineral substances; and one part of rotted hot-bed dung, with one part of rotted leaves of trees, and mixes them all well together, so as to form a compost-soil of uniform quality. (*Caled. Hort. Mem.* iii. 302.)

Though orange-trees will grow exceedingly well in large pots and boxes, yet to have them produce the finest crop of fruit they should be planted in the ground like peach-trees, and trained like them, or as standard cherries in a conservatory. The latter has by far the best effect, especially when the stems of the trees are seven or eight feet high, and the head forms a handsome cone; but the largest fruit is produced when the trees are planted against the back-wall trellis of a narrow house, and treated like peach-trees. Henderson grows his largest fruit in this manner, and we have seen them fully as large as any we ever saw at Genoa or Naples.

1616. *Xanthochymus.* From ξανθος, yellow, and χυμα, any thing which exudes: in allusion to the color of the juice which flows from the ripe fruit when wounded, and which, being inspissated, yields a material for water-color painting which is as good as Gamboge. Handsome plants, of the usual culture in light loam, and propagated by cuttings in sand under a hand-glass.

1617. *Hypericum.* A name of unknown meaning. The species are chiefly under-shrubs, generally with dotted leaves, and almost, without exception, yellow flowers. The hardy species are useful for the fronts of

History, Use, Propagation, Culture,

shrubberies. H. calycinum soon spreads over a considerable surface, and being evergreen, and growing under the shade, it is well adapted for covering bare spots under trees, and at the base of walls where few plants will thrive.

H. Androsæmum; from ανηρ, a man, and αιμα, blood, because the fresh capsules, bruised between the fingers, give out a blood-colored juice, is called Tutsan from *Toute-saine*, Fr., from its bruised capsules being formerly applied to fresh wounds.

H. perforatum was formerly used in external wounds and hæmorrhages as a balsamic, and was reputed to have other medical properties. The semi-transparent dots on the leaves are the receptacles of an essential oil. The flowers tinge spirits and oils of a fine purple color; and the dried plant, boiled with alum, dyes wool of a yellow color. The common people in France and Germany gather it with great ceremony on St. John's day, and

11018 Stem round much branched, Lvs. sess. lanc. undul. wavy at base with pellucid dots, Cal. very small blunt
11019 Flowers 2-3-gynous terminal, Cal. lanc. entire, Leaves lanc. oblong and erect, Stem simple downy
11020 Stem round, Lvs. lin. lanc. with pellu. dots: low. closely imbric. very short blunt, Cal. acute rather unequal
11021 Stem round, Leaves very small ovate close not dotted, Flowers few subsessile, Cal. acute lanceolate
11022 Styles 3, Flowers terminal subcymose, Stems comp. prostrate, Leaves oblong obtuse glabrous
11023 Styles 3, Stem compressed, Leaves elliptico-oblong obtuse with pellucid dots, Cal. leaves lanceolate
11024 Stem herbaceous upright 4-winged, Lvs. lin. somewhat blunt with fine pellucid dots and black dots beneath

11038 Stem round, Leaves ovate blunt with a small petiole revolute at edge, Calyx ovate blunt [with black
11039 Stem round slightly winged, Lvs. amplexicaul. subcord. ovate obl. blunt with pellucid dots, Anthers dotted
11040 Stem with 2 angles decumbent at base, Lvs. linear-lanc. spreading blunt revolute at edge, Cal. ovate acute
11041 Stem round ascending, Lvs. obl. lanc. bluntish narrowed at each end with pellucid dots, Cal. somewhat blunt
11042 Stem round, Branches somewhat winged, Leaves in threes linear revolute at edge, Calyx very small blunt
11043 Stem round ascending, Leaves whorled linear revolute at edge, Calyx linear somewhat blunt
11044 Stem round tortuous minute, Leaves round acute clustered dotted glaucous very small

§ 5. *Sepals* 5, *entire, equal, like the leaves.* *Stamens* 00. *Styles* 3-5. Brathys.

11045 Stem round compressed at end, Leaves dense not dotted channelled revolute at edge, Cal. equal straight

11046 Stem small simple quadrangular, Leaves oval blunt fascicled, Pedicels 6 lines long reflexed
11047 Stem round, Branches erect, Lvs. ovate linear blunt generally fascicled in the axillæ, Inner sepals orbicular
11048 Stem round, Leaves oblong linear blunt with 2 glands at base, Inner sepals somewhat orbicular
11049 Stem winged straight, Leaves ovate ellipt. blunt glaucous, Inner sepals cordate orbicular
11050 Stem dichotomous panicled, Leaves ovate cordate crisp, Corymb naked, Styles 3

11051 Sepals scarcely toothed reflexed as long as petals, in fruit reflexed and longer than the obovate capsule
11052 Sepals toothed shorter than petals, in fruit erect and shorter than the pear-shaped capsule
11053 Stem twining, Leaves bipinnatifid with narrow obtuse segments
11054 Hispid, Leaves opposite and alternate cordate ovate lobed, Petals flattish, Flower very large

and Miscellaneous Particulars.

hang it in their windows as a charm against storms, thunder, and evil spirits; mistaking the meaning of some medical writers, who have fancifully given this plant the name of *Fuga Dæmonum*, from a supposition that it was good in maniacal and hypochondriacal disorders. In Scotland it was formerly carried about as a charm against witchcraft and enchantment.

H. humifusum is one of the prettiest little plants of the genus, well adapted for growing in pots.

1618. *Ascyrum.* From α, privative, and σκυρος, roughness; that is to say, a smooth plant, *Linn.* Curious little plants, of the same culture as the Hypericums.

1619. *Loasa.* A name applied to these plants by Adanson, but of unknown meaning. Stinging, mostly annual plants; some of the species are handsome hardy annuals, remarkable for the beauty of their highly curious flowers. L. volubilis will not succeed in the open air.

Class XIX. — SYNGENESIA. Stamens 5. Anthers united by their edges.

This is one of the most extensive and best defined of all the Linnean classes. Its essential character depends, as its name indicates, (συν, together, and γενεσις, generation,) upon the adhesion of the antheræ or male organs of the flower into a single tube. It comprehends the whole of the Corymbiferæ, Cichoraceæ, and Cinarocephalæ of Jussieu; and, with the exception of Acicarpheæ, nothing else. The genera constituting the order Monogamia of Linnæus are excluded by Linnean botanists of the present day.

In addition to the cohesion of the anthers, upon which this class immediately depends, it is further characterized by the flowers, commonly called florets, being clustered together in heads, and inserted upon a common receptacle, which is surrounded by an involucrum, commonly, but very improperly, termed calyx. The few genera, such as Kuhnia, Euxenia, Acicarpha, &c., in which a union of anthers either does not exist at all, or in a very incomplete degree, are therefore retained in Syngenesia, because of their congruity in the structure of their inflorescence.

The real nature of the various constituent parts of syngenesious inflorescence being, from its complicated nature, very puzzling to the unlearned, and, as it would seem, to some professors also, it may be useful to explain briefly the analogy the various parts bear to the organs of other plants, and the terms employed in describing them.

The *Head* or *Capitulum* is a cluster of flowers of the nature of an umbel, inserted upon a common rachis, which, by contraction or incomplete developement, assumes the form of a conical or flat body, out of which the flowers proceed, and which is called a receptacle. This is surrounded by the involucrum. M. Cassini calls the head *Calathide*.

The *Involucrum* is the most external part of the head. It consists of a more or less considerable number of scales or leaves, placed in a single row, either distinctly from each other, or united at their edges, in which case the involucrum is called one-leaved; or placed in many rows, becoming gradually shorter as they are external, in which case they are called imbricated. If the external scales surround the internal at the base in a regular manner, then the involucrum is said to be calyculate. The involucrum was called *common calyx* by Linnæus, and has been more recently denominated a perianthium. M. Cassini names it *Periclinium*.

The *Receptacle* (Clinanthium of Cassini) is a cellular fungous surface surrounded by the involucrum, and bearing the florets. It is either columnar, conical, flat, or depressed; and naked, or covered with appendages called hairs or bristles, according to their nature, or paleæ, when they are dilated and have a glumaceous appearance. If naked, and merely scarred by the insertions of the florets, it is called dotted or punctículate; when the scars are more considerable and deeper, the receptacle is said to be scrobiculate; if the insertions are so deep as to appear to be divided by membranous partitions, it is cellular, or favose, or alveolate; if furnished with hairs, it is villose; if with paleæ, it is paleaceous or chaffy.

The *Paleæ* are of the same nature as bracteæ, and exist in various degrees of developement. Occasionally they are as large as the scales of the involucrum, which they in that case closely resemble.

The flower, usually termed *Floret*, consists of two parts, the ovarium and the corolla, each with its appendages.

The *Ovarium* is always one-celled, but it occasionally has two additional obsolete cells, as in Arctotis. It is either naked, or covered with hairs in various degrees, occasionally becoming enveloped in fine wool, and it is surmounted by an organ named the pappus.

The *Pappus* has generally been esteemed a superior calyx, and it is the opinion of M. Cassini that it is analogous to the scales of the receptacle, and the leaves of the involucrum.

The *Corolla* is placed on the top of the ovarium. It is either funnel-shaped, with a limb divided into four or five equal lobes, in which case the florets are denominated *tubular;* or it is split on one side, and spread open into the form of a strap, when the florets are called *ligulate;* or it is divided into two portions, of which one is unequal to the other; this form is called bilabiate or two-lipped. Bilabiate corollas may be either ligulate or flosculous, according to the species to which they belong. Occasionally the corolla appears to be absent.

The *Stamens* are attached to the orifice of the tube of the corolla, just below the limb. Their *filaments* are usually, but not always, distinct; their *anthers* are adherent by their edges, and furnished with a little membranous appendage at the tip, and sometimes with two spur-like processes at their base.

The *Style* is filiform, and either split at the summit into two linear spreading stigmas, or consists of a single piece from the base to the summit. The form and surface of the stigma, and the upper part of the style are subject to a great diversity of appearances, which are of the utmost importance in determining the affinities of the genera.

The *Florets* are either hermaphrodite, unisexual, or neuter. Upon these differences of sex the orders of Linnæus are founded.

In *Syngenesia æqualis* the florets are all hermaphrodites.

In *Syngenesia superflua*, those of the disk or centre are hermaphrodite, of the circumference or ray female, (and *superfluous.*)

In *Syngenesia frustranea*, those of the disk are hermaphrodite, of the ray neuter, (and *useless.*)

In *Syngenesia necessaria*, those of the disk are male, of the ray female, (and *necessary.*)

Syngenesia segregata is only characterized by the heads themselves being clustered and surrounded by a common involucrum.

The genera of Syngenesia have always attracted much attention from systematic botanists, who have met with very unequal success in characterizing them. The older botanists comprised them all under a few general heads or names. Tournefort, with his usual happiness, pointed out a large proportion of the most natural genera. Vaillant established a considerable number. Linnæus, profiting by the labours of his predecessors, rejecting some genera, and dividing others, increased their number, and adapted them to his sexual system, in nearly the same order in which they exist at the present day. Jussieu, by applying to the genera the principles of his natural method, reduced them to an arrangement much superior in point both of facility and of natural affinity to that of his northern rival. But however meritorious the labours of these great systematists may have been, much remained to be effected, even among their own plants, by those who followed them. The indefatigable Gærtner, who worked upon the only satisfactory or philosophical principle, that of strict analysis, soon discovered that the combinations of Linnæus and Jussieu were often too vague and ill defined to accord with his notions of accurate subdivision. Hence many other genera arose. But since his days, the extent of Syngenesia has, like all other parts of botanical science, increased exceedingly, and has arrived in our days at a state little short of absolute confusion. Injudicious or superficial botanists, impressed with the fear of innovation, and with a pious reverence even for the errors of those who went before them, have from time to time crowded the genera of Jussieu and Linnæus with the most incongruous species, and so have rendered many of those which were originally pure and simple, heterogeneous masses of species. Much has been done by our learned countryman, Mr. Robert Brown, to reduce to order this class of individuals, and, as far as his published observations have extended, with the happiest success. In France, an ingenious and accurate observer, Mr. Henry Cassini, has undertaken a revision of the whole class, upon principles peculiar to himself; and it must be allowed, that what he has executed has given ample room for regret that he has not published more. Unfortunately, his observations are scattered over the face of many books, and are in no case in such a state of arrangement as to be extensively useful. It is hoped that a period will soon arrive when he, or at least some

of his countrymen, will place in one view the result of his labours, so as to enable the world to judge with more accuracy, both of their extent, and of their real importance in defining the limits of the genera and their orders. The style and stigma, which had been previously almost overlooked, have furnished M. Cassini with what appear to be beautiful distinguishing marks of his orders; and it is upon these organs that much of the peculiarity of his arrangement depends. In the mean while, till it can be ascertained what the ultimate division of Compositæ is likely to be, it has been considered more prudent in this work to indicate none of the divisions of either M. Cassini, or of his fellow-labourers in France or elsewhere.

In a popular point of view, Syngenesia may be considered interesting in a high degree. It abounds in plants of ornament, all of which are, without exception, of easy cultivation It is not necessary to particularize the merits of the brilliant varieties of the Dahlia, or of the Chinese Chrysanthemum, which are the chiefest ornaments of every autumnal garden; nor to point out the beauty of the various tribes of Aster, Helianthus, Coreopsis, Xeranthemum, or Gnaphalium. These and an hundred others must be familiar to every lover of gardening. It is, however, worth remarking, that nearly all syngenesious plants are autumn flowers. In the tropics, many become trees of considerable dimensions; in temperate climates, they are mostly herbaceous or low bushes.

With regard to the qualities of syngenesious plants, considered economically or medicinally, it may be stated, that, whatever they may be, they consist in a bitter principle, and an oily secretion. But these vary in particular tribes. In some the bitter is combined with a resinous principle, by which its powers are increased in different degrees. In those plants in which the resin is found in small quantities only, and mixed with a bitter or astringent mucilage, tonic, stomachic, and febrifugal properties seem to be acquired, as in the camomile, the golden rod, the feverfew, and the Eupatorium perfoliatum; and the stimulant powers of these plants appear to increase in proportion as the resin is abundant. Some kinds are anthelmintic, as the wormwood and tansy; others are emmenagogue, as the feverfew, the yarrow, and various kinds of wormwoods. Certain species possess sudorific qualities, as the Eupatorium, the yarrow, the wormwood, and the marigold; others, again, are powerful diuretics, as Liatris; while stimulating powers exist in considerable activity in others, as in the Sneezewort and Arnica. The Spilanthus, Anthemis, Pyrethrum, and some others, excite salivation. The Eupatorium Ayapana of Brazil, and the Guaco of Peru, which is another species of Eupatorium, are most powerful alexiterics. According to the analysis of M. Braconnot, the wormwood owes its bitterness to an extremely bitter animalized matter, which forms a little less than one fifth of its weight; the same chemist also states that plant to contain a volatile oil, and an acid, apparently new, which is found in combination with potash. Before the perfect developement of the leaves, the bitter principle is so much diluted with insipid mucilage, that the young shoots of some of the thistle tribe, the Cardoon for example, are used for culinary purposes; and it is probable, that it is owing to the small proportion which the bitter bears to the whole mass, that the receptacle of the artichoke, of the Onopordum, and of the cotton thistle, is found fit for food. The corollas of the Cardoon, and of many thistles, have the power of curdling milk. The juice of the lettuce and other cichoraceous plants is milky, bitter, astringent, and narcotic. In a wild state, the narcotic principle is so abundant, that the inspissated juice of Lactuca virosa has been used as a substitute for opium, and with much success But under the effect of cultivation, the mucilage is so much more abundant than any other substance, that the same species often form well-known articles of wholesome and agreeable food. And, indeed, under any circumstances, wild or domesticated, the young shoots, when the narcotic principle is scarcely developed, are frequently eaten with safety; it is for the same reason, namely, the incomplete formation of the bitter principle, and the superabundance of mucilage, on account of the absence of light, that the blanched leaves of cardoons and chiccory, and the white roots of the Scorzonera and the Salsafy, are capable of being eaten without inconvenience. The seeds of all syngenesious plants abound in oil, which is expressed from those of the Madia of Chili, the Verbesina sativa, and the common sunflower. Owing to the difficulty of procuring this oil in a pure state, its virtues are not ascertained with much accuracy. They are generally believed to be slightly purgative and diaphoretic.

Order 1. ÆQUALIS.

Flowers of the disk and ray all hermaphrodite.

1620. *Geropogon.* Receptacle setose-paleaceous. Invol. many-leaved, simple, or with bracteolæ. Pericarps of disk with branched pappus, of the ray with five awns.

1621. *Tragopogon.* Involucre simple, of many leaves. Receptacle naked. Pappus feathery, stipitate. Pericarps longitudinally striated.

1622. *Troximon.* Invol. oblong, conical, simple, or imbricated with unequal scales. Recept. naked, dotted. Pappus sessile, hairy.

1623. *Arnopogon.* Recept. naked. Pappus feathery, stipitate. Involucre 1-leaved, 8-parted, turbinate.

1624. *Podospermum.* Recept. warted. Pericarps cylindrical on a long stalk. Leaves finely cut. Otherwise as Scorzonera.

1625. *Scorzonera.* Recept. naked. Pappus feathery, somewhat stalked. Invol. imbricated, with scales scarious at edge.

1626. *Picridium.* Invol. ventricose at base, imbricated with broadish scales, membranous at edge. Pappus sessile, villous, simple. Pericarps 4-cornered, warted across.

1627. *Sonchus.* Involucre imbricated, swelling at the base. Receptacle naked. Pappus simple, sessile.

1628. *Lactuca.* Involucre imbricated, cylindrical, its scales with a membranous margin. Receptacle naked. Pappus simple, stipitate.

1629. *Chondrilla.* Receptacle naked. Invol. with bracteolæ. Pappus simple, stalked. Florets in many rows. Pericarps muricated.

1630. *Prenanthes.* Involucre with scales at the base. Receptacle naked. Pappus simple, sessile. Florets few.

1631. *Leontodon.* Involucre with scales that are frequently lax and flaccid. Receptacle naked. Pappus simple, stipitate.

1632. *Apargia.* Involucre imbricated with scales at the base. Receptacle naked, dotted. Pappus feathery, sessile, unequal.

1633. *Thrincia.* Recept. favose. Pappus of the ray membranous, multifid, of the disk stalked, feathery. Invol. with 8 angles and 8 leaves.

1634. *Picris.* Cal. double, the inner equal, the outer lax. Receptacle naked. Pappus feathery. Pericarps transversely striated.

1635. *Hieracium.* Involucre ovate, imbricated. Receptacle nearly naked, dotted. Pappus simple, sessile.

1636. *Lagoscris* has the characters of Crepis, but the pappus is stalked.

1637. *Borkhausia.* Invol. oblong in two rows, the outer much shorter than the inner. Recept. alveolate. Pappus of the centre stalked, of the circumference sessile or subsessile.

1638. *Crepis.* Involucre surrounded with deciduous scales, and at length swelling into protuberances. Receptacle roughish. Pappus sessile.

1639. *Helminthia.* Recept. naked. Invol. double: outer 8-leaved, equal; inner 5-leaved, as long as outer. Pericarps striated across. Pappus stalked, feathery.

1640. *Myoseris.* Recept. paleaceous. Paleæ capillary. Invol. calyculated. Pappus hairy, sessile.

1641. *Tolpis.* Recept. favose. Invol. with bracteolæ, which are subulate, and as long as invol. Pappus of the ray toothed, of the disk with 2 or 4 awns.

1642. *Andryala.* Recept. villous. Invol. many-parted, nearly equal, rounded. Pappus simple, sessile.

1643. *Rothia.* Recept. villous, chaffy at edge. Invol. many-leaved, equal. Pappus hairy, of the disk sessile, of the ray none.

1644. *Krigia.* Recept. naked. Pappus membranous, 5-leaved, with 5 bristles between. Invol. many-leaved, simple.

1645. *Hyoseris.* Recept. naked. Invol. with bracteolæ. Pappus double: exterior capillary; interior paleaceous, awned.

1646. *Hedypnois.* Recept. naked. Invol. with bracteolæ. Pappus of disk double: outer obsolete, of many bristles; inner paleaceous, 5-leaved; of the ray a membranous toothletted margin.

1647. *Robertia.* Invol. many-leaved, equal. Recept. scaly. Pappus feathery, the hairs being slightly membranous at base.

1648. *Seriola.* Recept. paleaceous. Invol. simple. Pappus somewhat hairy.

1649. *Soldevilla.* Invol. imbricated, in fruit ventricose at base, with scales conniving at end. Recept. paleaceous; paleæ very short, setose. Pappus O.

1650. *Hypochæris.* Involucre oblong, imbricated. Receptacle chaffy. Pappus feathery, stipitate, or sessile.

1651. *Lapsana.* Involucre with scales at the base. Receptacle naked (its inner leaves equal, channelled, *Sm.*) Pericarps destitute of pappus (deciduous).

1652. *Zacintha.* Recept. naked. Pericarps of the ray incurved, of the disk straight. Pappus very short, somewhat feathery. Invol. with bracteolæ, which are membranous.

1653. *Rhagadiolus.* Recept. naked. Pericarps arcuate, spreading. Pappus O. Invol. with bracteolæ.

1654. *Moscaria.* Invol. 6-leaved, equal. Recept. flat, paleaceous. External pericarps with a short feathery pappus; central with none.

1655. *Catananche.* Recept. paleaceous. Invol. imbricated, scarious. Pappus paleaceous, 5-leaved; paleæ awned.

1656. *Triptilion.* Invol. imbricated, the exterior scales somewhat squarrose. Florets bilabiate: the upper lip 3-toothed; lower entire revolute. Recept. villous. Pappus with 3 feathers.

1657. *Cichorium.* Involucre surrounded with scales or smaller leaflets. Receptacle naked or slightly hairy. Pappus sessile, scaly, shorter than the pericarp.

1658. *Bacazia.* Invol. imbricated, scarious. Florets, one in the middle large tubular; the others 4-toothed, with a revolute bristle inserted in the mouth of the tube. Recept. pilose. Pappus feathery.

1659. *Scolymus.* Receptacle paleaceous. Invol. imbricated, spiny. Pappus O.

1660. *Arctium.* Involucre globose, each of its scales with an incurved hook at the extremity. Receptacle chaffy. Pappus simple.

1661. *Serratula.* Involucre cylindrical, imbricated with scales that are not spinous. Receptacle chaffy. Pappus roughish or feathery, rigid, persistent.

1662. *Saussurea.* Involucre imbricated, not spiny, outer scales acute, inner obtuse, membranous. Pappus feathery, in two rows, the exterior being shortest, the inner somewhat united at base.

1663. *Carduus.* Involucre swelling, imbricated with spinous scales. Receptacle hairy. Pappus deciduous, roughish.

1664. *Silybum.* Invol. ventricose, imbricated: outer leaves with appendages at end; inner cochleate. Recept. chaffy. Pappus linear, chaffy, deciduous.

1665. *Cnicus.* Involucre swelling, imbricated with spinous scales. Receptacle hairy. Pappus deciduous, feathery.

1666. *Onopordum.* Involucre swelling, its scales spreading, and spinous. Receptacle cellular. Pappus deciduous, rough.

1667. *Berardia.* Invol. imbricated with linear unarmed scales. Recept. somewhat favose, naked. Pappus hairy, generally twisted spirally, persistent.

1668. *Cynara.* Recept. setose. Invol. dilated, imbricated; scales fleshy, emarginate, with a point. Pappus sessile, feathery.

1669. *Carlina.* Involucre swelling: the exterior scales with numerous spines; the inner ones colored, scariose.

1670. *Atractylis.* Recept. paleaceous. Pappus feathery. Invol. imbricated with bracteolæ. Florets of ray 5-toothed.

1671. *Acarna.* Recept. paleaceous. Pappus feathery. Invol. imbricated with bracteolæ. Florets flosculous.

1672. *Stokesia.* Recept. naked. Pappus with 4 bristles. Invol. leafy, somewhat imbricated. Heads radiated; florets of ray funnel-shaped, irregular.

1673. *Stobæa.* Invol. imbricated, with toothed spiny scales. Florets flosculous. Recept. hispid, favose. Pappus paleaceous.

1674. *Onobroma.* Invol. ventricose: outer scales large, herbaceous, spiny, acuminate; inner coriaceous, unarmed. Recept. paleaceous. Pappus setaceous, rigid, unequal.

1675. *Carthamus.* Recept. paleaceous, setose. Invol. ovate, imbricated; scales ovate, leafy at end. Pappus paleaceous, hairy, or none.

1676. *Cardopatum.* Invol. 6-8-fl. many-leaved, imbricated, the outer scales branched, spiny. Recept. paleaceous, with long fascicled paleæ. Pericarps villous.

1677. *Stæhelina.* Recept. with very short paleæ. Pappus feathery. Anthers awned at base. Invol. hemispherical, imbricated.

1678. *Palafoxia.* Invol. oblong, somewhat imbricated, 8 or many-leaved, many-flowered. Cor. flosculous, longer than calyx, with a 5-fid limb. Pappus chaffy. Receptacle naked. Fruit marginal, wrapped up in the involucre.

1679. *Pteronia.* Recept. paleaceous; paleæ many-parted. Pappus somewhat feathery. Invol. imbricated with keeled scales.

1680. *Vernonia.* Recept. naked. Invol. ovate, imbricated. Pappus double: outer paleaceous; inner capillary.

1681. *Ammobium.* Invol. imbricated, colored, radiant. Anthers with 2 bristles at the base. Chaffs of receptacle distinct. Pappus a toothed edge.

1682. *Liatris.* Recept. naked. Invol. oblong, imbricated. Pappus feathery.

1683. *Mikania.* Recept. naked. Invol. 4-6-leaved, equal, 4 or 6-flowered. Pappus hairy.

1684 *Sparganophorus.* Invol. subglobose, imbricated with unequal scales, recurved, spreading at end. Recept. naked. Pericarps crowned with a somewhat cartilaginous cup.

1685. *Eupatorium.* Involucre imbricated, oblong. Florets few. Receptacle naked. Pappus rough.

1686. *Dumerilia.* Invol. many-parted, equal. Receptacle paleaceous. Florets bilabiate. Anthers spurred at base. Pappus feathery, sessile.

1687. *Ageratum.* Recept. naked. Pappus with 5 somewhat-awned paleæ. Invol. oblong in a double row. Corollas 4-5-fid.

1688. *Cælestina.* Invol. cylind. many-leaved, imbricated. Recept. convex, naked. Florets all tubular. Stigmas very long, spreading. Pericarps truncate, 5-cornered. Pappus a membranous rim.

1689. *Stevia.* Recept. naked. Pappus paleaceous. Invol. cylindrical in a single row.

1690. *Cephalophora.* Recept. naked, hemispherical. Pappus paleaceous, many-leaved. Invol many-leaved, reflexed.

1691. *Amphirepis.* Invol. hemispherical, imbricated. Recept. flat, naked. Florets all tubular. Pericarps cylindrical, naked. Pappus hairy, deciduous.

1692. *Hymenopappus.* Invol. many-leaved, spreading; scales ovate, colored. Recept. naked. Pappus many-leaved, paleaceous.

1693. *Melananthera.* Recept. paleaceous, convex. Invol. many-leaved, in a double row. Pappus of from 2 to 18 rough bristles. Pericarps turbinate, angular.

1694. *Marshallia.* Recept. paleaceous. Pappus of 5 membranous acuminate paleæ. Invol. imbricated; scales somewhat lanceolate, incumbent.
1695. *Spilanthes.* Recept. paleaceous, conical. Pappus with 2 awns, one smaller than the other. Invol. nearly equal.
1696. *Salmea.* Recept. conical, paleaceous. Pappus with 2 awns. Pericarps depressed. Invol. imbricated.
1697. *Bidens.* Involucre of many leaves, with many foliaceous bracteas at the base. Receptacle plane, chaffy. Cor. sometimes radiant. Pericarps crowned with from 2-5 persistent awns, which are rough, with minute deflexed bristles.
1698. *Platypteris.* Invol. many-leaved, imbricated, squarrose. Recept. convex, paleaceous. Pericarps compressed, winged, with 2 awns at top.
1699. *Lagascea.* Invol. 1-leaved, tubular, 1-flowered, divided at end. Floret tubular, hermaphrodite. Pericarps linear, cuneate, compressed. Pappus a small fringed crown.
1700. *Lavenia.* Recept. naked. Pappus with 3 awns, glandular at end. Invol. ovate, somewhat imbricated.
1701. *Cacalia.* Recept. naked, Pappus pilose. Invol. cylindrical, oblong, at the base only with bracteolæ.
1702. *Kleinia.* Recept. naked. Pappus hairy. Invol. simple, equal, 5-leaved.
1703. *Ethulia.* Recept. naked. Pappus a very narrow rim. Invol. equal, in a double row.
1704. *Piqueria.* Recept. naked. Invol. equal, 4-leaved, 4-flowered, Pappus none. Pericarps pentagonal.
1705. *Chrysocoma.* Recept. naked. Pappus simple. Invol. hemispherical, imbricated. Style scarcely longer than florets.
1706. *Tarchonanthus.* Recept. villous. Pericarps enveloped in hair. Invol. 1-leaved, half 7-fid, turbinate.
1707. *Calea.* Recept. paleaceous. Pappus hairy. Invol. imbricated.
1708. *Isocarpha.* Recept. paleaceous conical, the outer paleæ forming the involucrum. Pappus O. Anthers not spurred at base. Stigmas with a long appendage.
1709. *Petrobium.* Recept. paleaceous, flattish. Invol. many-leaved, in 2 rows: outer row shortest. Pericarps angular. Pappus awned.
1710. *Neurolæna.* Recept. paleaceous, flattish. Pappus capillary, toothletted, persistent. Invol. imbricated, leafy. Anthers awnless at the base.
1711. *Humea.* Recept. minute, glandular. Pappus none. Invol. loosely imbricated, membranous. Florets about 3, tubular. Anthers awned.
1712. *Cæsulia.* Recept. paleaceous: paleæ enveloping the pericarps. Pappus O. Invol. 3-leaved.
1713. *Ixodia.* Recept. paleaceous. Pappus O. Invol. imbricated: inner scales radiant colored.
1714. *Santolina.* Recept. paleaceous. Pappus O. Invol. imbricated, hemispherical.
1715. *Otanthus.* Invol. hemispherical imbricated. Florets with 2 appendages at base. Recept. convex, paleaceous. Pappus O.
1716. *Caleacte.* The same as Calea, but it has a radius of ligular female florets.
1717. *Athanasia.* Recept. paleaceous. Pappus paleaceous, very short. Invol. imbricated.
1718. *Balsamita.* Recept. naked. Pappus O. Invol. imbricated.
1719. *Pentzia.* Recept. naked. Pappus a membranous torn rim. Invol. imbricated, hemispherical.

SUPERFLUA.

§ *Florets of the disk hermaphrodite: of the ray female.*

1720. *Tanacetum.* Invol. hemispherical, imbricated. Recept. naked. Florets of the ray trifid, obsolete sometimes wanting. Pericarps crowned with a membranous margin or pappus.
1721. *Artemisia.* Invol. ovate or rounded, imbricated. Recept. naked (or downy, *Sm.*). Florets of the ray subulate. Pericarps crowned with a membranaceous pappus.
1722. *Gnaphalium.* Recept. naked. Pappus hairy or feathery. Invol. imbricated: marginal scales round, scarious, colored.
1723. *Leontopodium.* Heads sessile in the leaves. Invol. woolly. Florets 5-fid. Pappus pencilled or hairy. Otherwise Guaphalium.
1724. *Evax.* Heads surrounded by bracteæ. Invol. ovate, imbricated, with appressed acuminate scales. Florets of disk 4-toothed: of the ray not toothed. Recept. subulate, paleaceous. Pericarps of the female flowers without pappus.
1725. *Antennaria.* Recept. scrobiculate. Pappus capillary. Invol. imbricated, scarious, colored. Anthers spurred at base. Florets dicœcious.
1726. *Metalasia.* Invol. cylindrical, radiant colored. Pappus deciduous, capillary, clavate. Florets few, hermaphrodite. Otherwise as Gnaphalium.
1727. *Astelma.* Recept. naked. Pappus feathery, sessile: rays connate at base. Invol. imbricated: with scarious scales, the interior of which are connivent.
1728. *Athrixia.* Heads radiant. Invol. obl. imbricated, awned, squarrose. Florets bilabiate. Pappus feathery. Recept. alveolate.
1729 *Xeranthemum.* Recept. paleaceous. Pappus paleaceous-setaceous. Invol. imbricated, radiated: with a colored ray.
1730. *Elichrysum.* Recept. naked. Pappus hairy or feathery. Invol. imbricated, radiated: ray colored.
1731. *Carpesium.* Recept. naked. Pappus O. Invol. imbricated, with the outer scales reflexed.
1732. *Baccharis.* Recept. naked. Pappus pilose. Invol. imbricated, cylindrical. Female florets mixed with the hermaphrodite ones.
1733. *Molina.* Invol. campanulate, imbricated. Pappus feathery. Recept. convex, naked, dotted. Flowers dicœcious.
1734. *Conyza.* Invol. roundish, imbricated. Recept. naked. Florets of the ray 3 cleft. Pappus rough.
1735. *Madia.* Recept. naked. Pappus O. Invol. double: outer 8-10-leaved, equal, longer than the inner, which is many-leaved.
1736. *Erigeron.* Invol. imbricated. Recept. naked. Florets of the ray numerous, very narrow, mostly of a different color from the disk. Pappus simple.
1737. *Tussilago.* Invol. simple, equal, submembranaceous, swelling. Recept. naked. Pappus simple.
1738. *Senecio.* Invol. subcylindrical, equal, scaly below; the scales withered at the tip. Recept. naked. Pappus simple.
1739. *Aster.* Invol. imbricated, its lowermost scales spreading (except in A. trifolium). Recept. naked. Florets of the ray more than 10. Pappus simple.
1740. *Solidago.* Invol. imbricated, its scales connivent. Recept. naked. Florets of the ray (of the same colour as the disk) about 5. Pappus rough.
1741. *Cineraria.* Recept. naked. Pappus simple. Invol. simple, many-leaved, equal.
1742. *Calotis.* Recept. naked. Pericarps crowned with two opposite paleæ and 1-3-barbed awns. Invol. nearly equal, many-leaved, in a single or double row.
1743. *Kaulfussia.* Invol. simple: leaflets keeled. Recept. naked, convex. Pappus of the ray a minute fringed rim; of the disk stiff and feathery.
1744. *Inula.* Invol. imbricated. Recept. naked. Florets of the ray very numerous, linear. Anthers with 2 bristles at the base. Pappus simply composed of hairs.
1745. *Pulicaria.* Invol. roundish, imbricated: scales linear, acuminate. Recept. naked. Pappus compound: outer a membranous cup; inner setaceous. Pericarps uniform.
1746. *Grindelia.* Recept. naked. Pappus setaceous, deciduous. Invol. imbricated, hemispherical.

1747. *Podolepis.* Recept. naked. Pappus hairy. Invol. imbricated, scarious, hemispherical: scales unguiculate.

1748. *Chætanthera.* Invol. many-leaved, ciliated. Florets of ray linear, 3-toothed, with a fine bifid spiral segment at the divisions. Anthers spurred at base. Recept. naked, flat. Pappus hairy.

1749. *Arnica.* Recept. naked. Pappus simple. Invol. with equal leaves. Florets of ray generally with 5 filaments without anthers.

1750. *Gerberia.* Florets bilabiate, those of the ray ligulate. Invol. imbricated, coriaceous. Recept. flat, naked. Pappus with long bearded paleæ.

1751. *Doronicum.* Scales of the invol. in 2 equal rows, longer than the disk. Recept. naked. Pericarps of the disk crowned with a simple pappus, those of the ray without a pappus.

1752. *Perdicium.* Recept. naked. Pappus hairy. Florets 2-lipped.

1753. *Tetragonotheca.* Recept. paleaceous. Pappus O. Invol. 1-leaved, 4-cornered, 4-parted.

1754. *Ximenesia.* Recept. paleaceous. Pappus O. Pericarps of ray naked, emarginate; of the disk winged. Invol. many-leaved, nearly equal.

1755. *Helenium.* Recept. naked, of the ray paleaceous. Pappus 5-awned. Invol. 1-leaved, many-parted. Florets of ray half-trifid.

1756. *Bellis.* Invol. hemispherical, its scales equal. Recept. naked, conical.

1757. *Bellium.* Recept. naked. Pericarps conical, with a paleaceous 8-leaved crown and awned pappus. Leaves of invol. equal.

1758. *Dahlia.* Recept. paleaceous. Pappus O. Invol. double: outer many-leaved; inner 1-leaved, 8-parted.

1759. *Bæbera.* Invol. double: outer many-leaved; inner 8-leaved. Recept. naked. Pappus hairy.

1760. *Tagetes.* Recept. naked. Pappus with 5 erect awns. Invol. simple, 1-leaved, 5-toothed, tubular. Florets of ray 5, persistent.

1761. *Heterospermum.* Recept. naked. Outer grains compressed with a membranous edge; inner oblong with two awns. Invol. double: outer 4-parted; inner many-leaved.

1762. *Schkuhria.* Recept. naked. Pappus paleaceous. Invol. 5-leaved. Florets of ray solitary.

1763. *Pectis.* Recept. naked. Pappus with 3 or 5 awns. Invol. 5-leaved. Florets of ray 5.

1764. *Longchampsia.* Differs from Pectis and Leysera, in having a double pappus, the exterior of which is edged, the inner feathery.

1765. *Leysera.* Recept. somewhat paleaceous. Pappus paleaceous: of the disk feathery. Invol. scarious.

1766. *Scilloa.* Invol. imbricated, ovate. Recept. naked. Pappus O. Female florets inconspicuous, mixed among the leaves of the involucrum.

1767. *Relhania.* Recept. paleaceous. Pappus membranous, cylindrical, short. Invol. imbricated, scarious. Rays numerous.

1768. *Zinnia.* Recept. paleaceous. Pappus with 2 erect awns. Invol. ovate, cylindrical, imbricated. Florets of ray 5, persistent, entire.

1769. *Chrysanthemum.* Invol. hemispherical, imbricated with scales whose borders are membranous. Recept. naked. Pappus none.

1770. *Pyrethrum.* Recept. hemispherical, imbricated with scales whose borders are membranous. Recept. naked. Pericarps crowned with a membranous margin.

1771. *Matricaria.* Invol. hemispherical or almost plane, imbricated with scales whose borders are membranous. Recept. naked, almost cylindrical. Pappus none.

1772. *Boltonia.* Recept. favose, hemispherical. Pappus toothed, awned, somewhat 2-horned. Rays numerous. Invol. imbricated.

1773. *Lidbeckia.* Recept. naked. Pappus O. Pericarps angular, with the lowest joint of style persistent. Rays numerous. Invol. many-parted.

1774. *Cenia.* Invol. in fruit turbinate, multifid. Florets of ray very numerous, short. Recept. naked. Pericarps compressed.

1775. *Cotula.* Recept. nearly naked. Pappus margined. Florets of disk 4-fid, of the ray scarcely any.

1776. *Grangea.* Invol. imbricated, spreading. Marginal florets 3-toothed. Recept. hemispherical. Pericarps with a toothed edge at top.

1777. *Anacyclus.* Recept. paleaceous. Pappus emarginate. Pericarps with membranous edges.

1778. *Anthemis.* Invol. hemispherical, its scales nearly equal, their margins scarious. Recept. convex, chaffy. Pericarps crowned with a membranous border or pappus.

1779. *Centrospermum.* Invol. hemispherical, of many imbricated, round, scarious scales. Recept. naked. Pappus spiny. Outer pericarps cymbiform, smooth.

1780. *Sanvitalia.* Recept. paleaceous. Pericarps of ray with 3 awns: of the side naked, warted; of the disk winged. Invol. imbricated, flat.

1781. *Achillea.* Invol. ovate, imbricated, unequal. Recept. plane, chaffy. Florets of the ray 5-10, roundish, obcordate. Pericarps naked.

1782. *Tridax.* Invol. cylindrical, imbricated, with ovate oblong scales. Florets of ray 3-parted. Recept. paleaceous. Pappus hairy, simple.

1783. *Amellus.* Recept. paleaceous. Pappus simple. Invol. imbricated. Florets of ray undivided.

1784. *Starkea.* Recept. hirsute. Pappus sessile, hairy. Invol. imbricated.

1785. *Columellia.* Invol. cylindrical, imbricated. Florets of ray undivided. Recept. naked, favose. Pappus a toothed edge.

1786. *Eclipta.* Recept. paleaceous. Pappus O. Florets of disk 4-fid.

1787. *Meyera.* Invol. 4-leaved, the 2 inner smallest. Recept. small, paleaceous, 2 palcæ enveloping the pericarp, keeled. Pappus O.

1788. *Chrysanthellum.* Invol. cylindrical, about as long as florets, scaly at base. Recept. paleaceous. Florets numerous, linear, 2-toothed, short, of the centre few, and generally abortive. Pericarps naked, roundish, furrowed, with an entire edge.

1789. *Siegesbeckia.* Recept. paleaceous. Pappus O. Outer invol. 5-leaved, inner spreading. Ray halved.

1790. *Verbesina.* Recept. paleaceous. Pappus awned. Invol. in one row. Florets of the ray about 5.

1791. *Synedrella.* Invol. generally of 2 leaves. Florets flosculous. Recept. obsolete, paleaceous: paleæ glumaceous; the outer ovate. Pericarps oval, flat, edged; the central dissimilar, near, oblong, with 2 or 3 awns.

1792. *Galinsoga.* Recept. paleaceous. Pappus many-leaved, paleaceous. Invol. imbricated.

1793. *Acmella.* Invol. simple, with a few somewhat leafy divisions. Recept. oblong, paleaceous. Heads radiant. Pericarps 4-cornered, truncate at end, naked.

1794. *Zaluzania.* Invol. with distinct, somewhat ovate, equal segments. Head radiant. Recept. conical, paleaceous; paleæ membranous, trifid, involving the pericarps, which are 4-cornered and naked.

1795. *Pascalia.* Recept. paleaceous. Pericarps drupaceous. Pappus a toothed rim. Invol. imbricated.

1796. *Heliopsis.* Invol. imbricated, with ovate lined squamæ. Cor. of ray linear, large. Recept. paleaceous, conical, with lanceolate paleæ. Pericarps 4-cornered. Pappus O.

1797. *Buphthalmum.* Recept. paleaceous. Pappus an obsolete rim. Sides of pericarps, especially of the ray, edged.

Order 3. FRUSTRANEA.

Florets of the disk fertile: of the ray sterile.

1798. *Helianthus.* Recept. paleaceous, flat. Pappus 2-leaved. Invol. imbricated, subsquarrose.

1799. *Gymnoloma.* Invol. hemispherical, loosely imbricated. Recept. convex, paleaceous. Central florets sterile; marginal radiant. Pappus O.

1800. *Rudbeckia.* Recept. paleaceous, conical. Pappus with a 4-toothed rim. Invol. with a double row of scales.
1801. *Galardia.* Recept. paleaceous, hemispherical. Pappus paleaceous, many-leaved. Invol. imbricated, many-leaved, flat. Rays 3-parted.
1802. *Tithonia.* Invol. many-leaved, cylindrical. Rays 3-toothed. Recept. paleaceous, convex. Pappus paleaceous, 5-leaved.
1803. *Cosmea.* Recept. paleaceous. Pericarps 4-cornered. Pappus with 2 or 3 awns. Invol. double, each 1-leaved, 8-parted.
1804. *Coreopsis.* Recept. paleaceous. Pericarps compressed, emarginate. Pappus with 2 horns. Invol. double, each many-leaved.
1805. *Simsia.* Invol. subcylindrical, nearly equal, with linear lanceolate incumbent scales. Recept. paleaceous. Pericarps flattish, somewhat edged, each edge awned.
1806. *Osmites.* Recept. paleaceous. Pappus obsolete. Florets of ray ligulate. Invol. imbricated scarious.
1807. *Encelia.* Recept. paleaceous. Pappus O. Pericarps vertical, flat, with a ciliated edge. Invol. imbricated.
1808. *Sclerocarpus.* Recept. paleaceous. Pappus O. Invol. double, each 3-leaved.
1809. *Cullumia.* Recept. favose. Pericarps smooth. Pappus O. Invol. 1-leaved, covered with imbricated leaflets.
1810. *Berckheya.* Recept. favose. Pericarps villous. Pappus paleaceous (sometimes bristly-paleaceous, ciliated). Invol. 1-leaved, covered with imbricated leaflets.
1811. *Didelta.* Recept. favose, inclosing the pericarps. Pappus many-parted, setaceous, paleaceous, toothed. Invol. 1-leaved, covered with leaflets, the exterior very large.
1812. *Gorteria.* Recept. scrobiculate. Pappus a ciliated edge. Invol. 1-leaved, covered with imbricated leaflets, of the fruit indurated, connivent, deciduous.
1813. *Gazania.* Recept. naked, or alveolate. Pericarps very villous. Pappus hairy-paleaceous. Invol. 1-leaved, the tube naked, or covered with imbricated leaflets.
1814. *Cryptostemma.* Recept. favose. Pappus paleaceous, covered by the entangled wool of the pericarp. Invol. imbricated.
1815. *Arctotheca.* Recept. favose. Pappus O. Invol. imbricated.
1816. *Sphenogyne.* Recept. with distinct paleæ. Pappus paleaceous, simple Stigmas with a dilated truncated end. Invol. imbricated, the inner scales or all with a dilated scarious end.
1817. *Zoegea.* Recept. setose. Pappus setaceous. Rays ligulate. Invol. imbricated.
1818. *Leuzea.* Invol. imbricated, spherical, not spiny. Recept. bristly. Pappus feathery, in many rows. Florets all hermaphrodite.
1819. *Centaurea.* Invol. scaly. Recept. bristly. Corollas of the ray infundibuliform, irregular, longer than those of the disk. Pappus simple.
1820. *Galactites.* Invol. imbricated, with somewhat squarrose spiny scales. Recept. favose. Pappus feathery, deciduous.
1821. *Wedelia.* Invol. 5-leaved, with broad leafy segments. Recept. paleaceous. Florets of the centre generally abortive, of the ray many, oval, 2-3-fid. Stigmas setaceous. Pappus stipitate, membranous, toothletted.

Order 4. NECESSARIA.

Florets of the ray female fertile: of the disk male.

1822. *Milleria.* Recept. naked. Pappus O. Invol. of 3 valves. Ray halved.
1823. *Baltimora.* Recept. paleaceous. Pappus O. Invol. cylindrical, many-leaved. Ray 5-flowered.
1824. *Silphium.* Recept. paleaceous. Pappus with a 2 horned edge. Invol. squarrose.
1825. *Trixis.* Invol. imbricated. Cor. of ray 3-fid. Recept. paleaceous. Pappus O. Pericarps villous at end.
1826. *Polymnia.* Recept. paleaceous. Pappus O. Invol. double: outer 4 or 5-leaved; inner 10-leaved, with common leaflets.
1827. *Chrysogonum.* Invol. 5-leaved. Recept. paleaceous. Pappus 1-leaved, 3-toothed. Pericarps with a little 4-leaved calyx.
1828. *Melampodium.* Recept. paleaceous, conical. Pappus 1-leaved, vulviform. Invol. 5-leaved.
1829. *Chaptalia.* Recept. naked. Pappus capillary. Florets of the ray in a double row, deformed; of the disk bilabiate.
1830. *Calendula.* Recept. naked. Pappus O. Invo. many-leaved, equal. Pericarps of the disk membranous.
1831. *Arctotis.* Recept. setose-alveolate. Pericarps half 2-celled, or 2-furrowed at the back. Pappus paleaceous. Invol. imbricated, with scales scarious at end.
1832. *Osteospermum.* Recept. naked. Pappus O. Invol. many-leaved. Pericarps globose, colored, bony.
1833. *Othonna.* Recept. naked. Pappus hairy. Invol. 1-leaved, many-cut.
1834. *Hippia.* Recept. naked. Pappus O. Pericarps with very broad edges, naked. Invol. hemispherical, somewhat imbricated. Florets of ray 10, obsoletely trifid.
1835. *Soliva.* Invol. 7-leaved, leaflets with imbricated edges, the 3 outer largest. Ray none. Recept. very small, somewhat villous. Pericarps compressed, surrounded by a membrane, crowned by 2 prickles and the style.
1836. *Psiadia.* Recept. naked. Pappus hairy, sessile. Invol. imbricated, ovate. Florets of ray short.
1837. *Eriocephalus.* Recept. paleaceous. Pappus O. Invol. double: inner 1-leaved; outer 5-leaved.
1838. *Filago.* Recept. paleaceous. Pappus O. Invol. imbricated. Female florets mixed among the scales of involucre.
1839. *Micropus.* Recept. paleaceous. Pappus O. Invol. calyculate. Rays none. Female florets enwrapped in the scales of involucre.
1840. *Parthenium.* Recept. paleaceous, flat. Pericarps obovate, nearly naked. Invol. 5-leaved.
1841. *Iva.* Recept. pilose. Pericarps naked, blunt. Invol. 3-leaved. Florets of ray 5. Styles 2, long.
1842. *Acicarpha.* Invol. 5-parted. Cor. all tubular. Recept. paleaceous, the palea being united with the pericarps after flowering. Pappus O. Stamens half-separate.

Order 5. SEGREGATA.

Each floret having its own peculiar involucre.

1843. *Elephantopus.* Invol. 4-flowered. Florets ligulate, hermaphrodite. Recept. naked. Pappus setaceous.
1844. *Œdera.* Invol. many-flowered. Tubular florets hermaphrodite, and one or more female and ligulate. Recept. paleaceous. Pappus with many paleæ.
1845. *Flaveria.* Partial invol. 2-5-leaved, 2-5-flowered. Common invol. imbricated with unequal scales. Florets tubular, 1 often ligulate. Pappus O. Recept. naked.
1846. *Stæbe.* Invol. 1-flowered. Floret tubular, hermaphrodite. Recept. naked. Pappus feathery.
1847. *Nauenbergia.* Partial invol. 2-leaved, 1-flowered; common invol. leafy. Pappus O. Receptacle setose.

1848. *Cassinia.* Involucre 2-flowered, 4-leaved. Florets hermaphrodite. Pappus paleaceous, pencilled. Receptacle naked.

1849. *Sphæranthus.* Involucre 8-flowered. Florets tubular, hermaphrodite, and obsoletely female. Receptacle scaly. Pappus O.

1850. *Echinops.* Involucre 1-flowered. Florets tubular, hermaphrodite. Receptacle setose. Pappus obsolete.

1851. *Rolandra.* Florets fascicled in a head, with scales between. Involucre 2-valved, 1-flowered. Florets hermaphrodite. Pappus O.

History, Use, Propagation, Culture,

1620. *Geropogon.* So named from γερων, an old man, and πωγων, a beard; in allusion to the long silky beard of the seeds.

1621. *Tragopogon.* From τραγος, a goat, and πωγων, a beard; a name applied in the same way as Geropogon. T. porrifolius, or Salsafy, has a long tapering fleshy white root, which is used like carrots or parsneps, and cultivated in gardens for that purpose. The flavor of the root is mild and sweetish; dressed like asparagus, there is some resemblance in taste. It is occasionally grown in British gardens, and a good deal in those of France and Germany. It is raised and treated in all respects similarly to the carrot. T. pratensis answers equally well for culture as this species, and was formerly preferred to it.

1852. *Brotera.* Partial invol. 1-flowered, many-leaved, common 6-8-flowered, imbricated, many-leaved. Florets tubular, uniform. Recept. naked. Pericarp covered by the adhering involucre.
1853. *Gundelia.* Invol. O. Hollows of the recept. 5-flowered. Florets tubular, male and hermaphrodite. Recept. paleaceous. Pappus O.
1854. *Euxenia.* Invol. 1-leaved, 10-cleft, reflexed, two of the segments larger than the rest. Anthers distinct. Pappus none. Recept. chaffy.

ÆQUALIS.

11055 Leaves smooth
11056 Leaves hairy
11057 Involucrum with scales at the base

11058 Invol. 8-leaved as long as ray, and peduncles downy, Leaves linear straight
11059 Involucre 8-leaved longer than rays of corolla, Leaves entire straight smooth
11060 Invol. about as long as the cor. Leaves undivided glabrous acuminated channelled, Peduncles cylindrical
11061 Invol. 8-leaved as long as rays of cor. Leaves entire straight lanc. acuminate
11062 Invol. as long as rays of cor. Leaves entire sub-linear; those of the stem very wavy
11063 Invol. shorter than ray of cor. Leaves entire somewhat wavy
11064 Invol. longer than ray of cor. Lvs. entire straight, Pedunc. thickened upwards, Florets rounded at end
11065 Woolly with down, Invol. shorter than ray of cor. Lvs. linear channelled: cauline revolute
11066 Invol. much longer than the cor. Leaves undivided straight, Peduncle thickened upwards
11067 Invol. 5-leaved longer than ray of cor. Leaves entire, Radical and peduncles villous at base
11068 Invol. half as long again as ray of cor. Stem and leaves villous

11069 Scape 1-fl. Leaves of invol. imbricated cuspidate, Leaves linear entire glaucous on each side
11070 Smooth glaucous, Stem erect 2-3-fid somewhat naked, Leaves smooth: radical sublyrate

11071 Invol. downy unarmed, Leaves runcinate toothed
11072 Invol. hispid aculeate, Leaves runcinate toothletted: cauline dilated at base
11073 Invol. hispid aculeate, Leaves entire: cauline obl. attenuated at base

11074 Lower leaves lyrate with obl. mucronate segments: upper pinnatifid
11075 Lower leaves pinnatifid: upper linear, Invol. smooth: lower scales spreading mucronate
11076 Lower leaves decursively pinnatifid lanc.: upper linear-lanceolate, Invol. before opening 8 angular

11077 Stem 1-flowered leafy, Leaves linear downy beneath, Root tuberous
11078 Leaves ovate nerved downy entire sessile
11079 Stem somewhat naked about 1-flowered, and scales of invol. woolly, Leaves obl. lanc. nerved flat
11080 Stem branched, Leaves amplexicaul. lanc. entire subserrulate at base
11081 Stem about 1-fl. leafy, Leaves lin. lanc. acuminate smooth nerved flat
11082 Stem about 1-fl. leafy ascending, Leaves lanc. ensif. smooth nerved flat, Ray longer than invol.
11083 Leaves lin. subul. channelled triquetrous, Stem branched
11084 Leaves lanc. lin. flat: cauline keeled linear, Stem 1-flowered
11085 Leaves lin. ensif. acum. rigid nerved keeled, Invol. villous leafy at base, Stem somewhat branched
11086 Leaves subulate entire, Pedunc. thickened, Stem villous at base
11087 Leaves lin. acum. keeled woolly at base, Stem branched, Invol. woolly, Fruit downy
11088 Leaves runcinate blunt smooth, Scape leafless branched, Peduncles thickened
11089 Stem leafy many-fl., and invol. downy, Lower leaves lanc. acuminate entire downy: upper lin. subulate
11090 Stem branched leafy at base, Leaves lanc. ensif. smooth nerved flat, Ray shorter than cal.
11091 Stem 1-fl. leafy at base, Leaves lin. lanc. wavy silky with down all over
11092 Stem leafy many-flowered erect, Leaves nerved filiform acuminate, Invol. and seeds woolly
11093 Leaves linear and 1-flowered, Stem hairy

and Miscellaneous Particulars.

1622. *Troximon.* So named by Gærtner, from τρωξιμος, eatable: but, as Sir James Smith observes, without much propriety.
1623. *Arnopogon.* So named from αρης αρνος, a lamb, and πωγων, a beard: see Geropogon. This is the same genus as has been called by Scopoli and Willdenow, Urospermum.
1624. *Podospermum.* From πους ποδος, a foot, and σπερμη, seed, on account of the long stalk of the fruit. Small herbaceous plants with the flowers of Scorzonera.
1625. *Scorzonera.* From *scurzon*, the Catalonian name of the viper. The plants are esteemed in Spain as a certain remedy for the bite of a viper; but it is believed that the slender tortuous form of the roots has

History, Use, Propagation, Culture,

given rise to this belief, rather than any quality inherent in the plant: for it is a rule to which there are few exceptions, that all plants used as food by man, possess very inactive qualities. If their action was powerful, they would be unfit for food.

Scorzonera hispanica is esteemed diuretic, stimulant, and sudorific. A drink is made from it for variola; and a distilled water is also prepared from it. It is also an esculent of occasional culture. The root is carrot-shaped, about the thickness of one's finger, tapering gradually to a fine point, and thus bearing some resemblance to the body of a viper. The outer rind being scraped off, the root is steeped in water, in order to abstract a part of its bitter flavor. It is then boiled or stewed in the manner of carrots or parsneps. The roots are fit for use in August, and continue good till the following spring. Its culture is the same as that of carrot or salsafy.

1626. *Picridium.* A diminutive of *Picris*, which see. Picridium sativum, *Picridium cultivé*, Fr., is sown in the spring as a small salad, and, if not allowed to become too old before it is cut, is an excellent vegetable, with a pleasant delicate flavor, wholly devoid of the bitterness of endive, and of the insipidity of very young lettuces. P. tingitanum is a favorite border annual.

1627. *Sonchus.* Σονχος, in Greek, said to be altered from σομφος, hollow, or soft, in allusion to the soft feeble stem of the plants. Sonchus oleraceus, *Sow-thistle*, Eng., *Hasenkohl*, Ger., seems to have nearly the same properties as the Dandelion and Succory, but it is little regarded as a medicine. It is a favorite food with hares and rabbits; and is said to be eaten by goats, sheep and swine, but not to be relished by horses. The young tender leaves are in some countries boiled and eaten as greens: and it is even affirmed, that the tender

11094 Lower leaves linear: upper pinnatifid, Lobes remote linear
11095 Leaves runcinate hispid, Stem about 2-fl. somewhat leafy hispid

11096 Cauline leaves amplexicaul. obl. nearly entire: radical sublyrate runcinate, Scales of invol. appressed

11097 Leaves amplexicaul. obl. pinnatifid toothed, Invol. squarrose
11098 Leaves scabrous, Scales of invol. membranous at edge ciliated

11099 Pedunc. subsol. term. naked, Leaves lanc. amplexicaul. undivided finely toothed backwards
11100 Pedunc. branched somewhat scaly, Leaves lanc. runcinate, Stem shrubby
11101 Pedunc. naked, Invol. smooth, Leaves pinn. Pinnæ lin.-lanc. somewhat toothed
11102 Pedunc. naked, Invol. turbin. smooth: lower scales reflexed at end, Leaves pinnatifid
11103 Pedunc. naked, Inv. turbin. smooth: low. scales reflexed at end, Lvs. lyrate pinnatif. Corymb divaricating
11104 Pedunc. naked and invol. smooth, Stem nearly naked, Radic. lvs. lyrate smooth on each side, Lobes triang.
11105 Pedunc. and invol. hispid somewhat umbelled, Leaves runcinate sagittate at base [ovate
11106 Peduncles and invol. hispid sub-umbellate, Leaves runcinate dentato-ciliate cord. at the base
11107 Peduncles sub-tomentose umbellate, Involucre glabrous, Lvs. runcinate dentato-ciliate amplexic. at base
11108 Pedunc. downy umbell. Invol. hairy, Leaves bipinnatifid cordate sagittate at base
11109 Pedunc. naked, Flowers panicled, Leaves runcinate
11110 Peduncles and involucre hispid racemose, Leaves sublyrate, Terminal lobe deltoid very large
11111 Pedunc. squarrose, Fl. racemose, Leaves runcinate acuminate smooth glaucous beneath
11112 Pedunc. sub-squarrose, Fl. panicled, Leaves lyrate-runcinate toothletted stalked
11113 Leaves sessile: lower cordate toothed; upper hispid entire, Peduncles scaly
11114 Pedunc. sub-squarrose, Fl. panicled, Radic. leaves sub-runcinate: cauline ovate acuminate stalked
11115 Raceme comp. terminal, Leaves lanc. ensiform amplexicaul. toothed
11116 Pedunc. squarrose, Fl. corymb. Leaves lanc. sessile: lower runcinate toothed; upper entire
11117 Pedunc. naked, Fl. in corymbose panicles, Leaves lanc. runcinate narrowed at base
11118 Leaves pinnatifid with little white spiny teeth, Calyx slender
11119 Pedunc. and invol. smooth a little downy, Leaves sub-runcinate spiny-toothed amplexicaul.
11120 Pedunc. somewhat downy umbellate, Invol. smooth, Leaves pinnatif. toothed auricled cordate at base
11121 Radic. leaves unequally pinnatifid: cauline linear lanc. toothed, Pedunc. long 1-flowered
11122 Peduncles hirsute naked, Fl. panicled, Leaves lyrate cordate at base hairy beneath
11123 Pedunc. scaly, Fl. racemose, Leaves runcinate acuminate, Stem panicled virgate

11124 Leaves rounded: cauline cordate, Stem corymbose
11125 Leaves sinuate-crenate toothed wavy curled: radical with a hairy keel, Florets 5-parted
11126 Lower leaves tripartite pinnatifid with obl. blunt segm.: upper cordate
11127 Leaves runcinate tooth-ciliated blunt amplexicaul. sagittate: radical obovate, Stem panicled
11128 Leaves smooth beneath: lower runcinate toothletted at base dilated and sagittate; upper lanc. sagittate
11129 Leaves smooth beneath: radical runcinate lyrate toothed; upper runcinate pinnatifid
11130 Leaves smooth beneath: lower runcinate entire amplexicaul.: upper lanceolate sessile
11131 Leaves vertical prickly at keel acute at end sagittate at base runcinate pinnatifid
11132 Leaves oblong toothed horizontal, their keel prickly, their apex obtuse
11133 Leaves smooth beneath obl. lanc. ciliate-toothed sagittate at base
11134 Leaves smooth beneath: lower oblong narrowed at base toothletted; upper lanceolate entire
11135 Leaves with a prickly keel: radical lanc. pinnatifid; cauline linear entire sagittate
11136 Leaves laciniate ensiform sessile unequally toothed
11137 Leaves toothletted smooth: lower sinuated; upper lanceolate sagittate acuminate, Pan. much branched

and Miscellaneous Particulars.

shoots of the smooth variety, boiled in the manner of spinach, are superior to any greens not in common use.

Nearly the same thing may be affirmed of S. arvensis, palustris, and other species.

Sonchus floridanus is used as a cure for the bite of the rattle-snake, in the same way as Prenanthes serpentaria. It is called by the American settlers *Gall of the Earth.*

S. tenerrimus is eaten by the common people in Italy as a salad

1628. *Lactuca.* From *lac*, milk, on account of the milky sap, which flows copiously when the plants are cut. Besides Lactuca sativa, the French cultivate as small salad both L. quercina, palmata, and intybacea, which are all excellently adapted for such a purpose. L. sativa is well known as furnishing among its numerous varieties the best vegetable of the salad kind grown in the open garden. Whoever has the command of lettuce, onions, and cucumbers, may well dispense with most other acetarious plants. It is questioned by some, whether the greater number of what are set down as species in this genus, are any thing more than variations of one type; and, at all events, it is thought L. virosa, a poisonous plant, is the parent of our cultivated sorts; which would not be more remarkable than the fact that the indigenous celery is one of our strongest poisons.

All the species of Lactuca abound in a milky juice, which is found to partake, in a considerable degree, of the qualities of opium. The production of this juice is lessened by culture, and especially by blanching. It is most abundant in plants in a wild state, and in both wild and cultivated lettuce during inflorescence. Of late years, this juice has been collected by incisions and scraping off the thickened juice, as in the collecting the opium of the poppy (See p. 461.), and an opium has been produced little inferior to that of the East. It is called

History, Use, Propagation, Culture,

Lactucarium, and was first brought into notice by Dr. Duncan, of Edinburgh, who finds it can be administered with effect in cases were poppy opium is inadmissible. Details of the process of collecting and preparing the article, will be found in the Caledonian Horticultural Memoirs. (Vol. i. 160-259. ii. 314. and iv. 153.)

The culture of lettuce as a salad plant is familiar to every one who has a garden. It is sown monthly, or oftener, throughout the year, in order to have a successional supply, and thinned out or transplanted to increase the size and succulency. The latter quality is greatly increased by watering in summer; and blanching, another desirable property, is promoted by tying up the leaves when the plant has attained about two-thirds of its usual size. Snails and slugs are very fond of this plant, and should either be watched and hand-picked, or the ground well watered with lime water, which effectually destroys them. The lettuce, unlike the cabbage and spinage, is a vegetable which can be grown to as great perfection in a warm as in a temperate climate, provided it be grown on rich soil, and abundantly supplied with water. Hence the lettuces of Paris, Rome, and Calcutta, are as large and tender as those of London and Amsterdam.

This genus is the type of the tribe *Lactuceæ* of M. Cassini. It differs essentially from all other tribes of Compositæ, in having a divided or ligulate corolla only, and from nearly all other tribes in its style, which can be compared to that of Vernonieæ only. The radiant head of flowers is a character common both to Lactuceæ and Nassauvieæ. The greater part of Lactuceæ are found in Europe, a smaller number in Asia and Africa, very few in America, and in the southern hemisphere none at all.

1629. *Chondrilla.* Derived from χονδρος, a lump. Dioscorides says, it bears on its stems little lumps of gummy matter. But Theophrastus speaks of the grumous or tubercled roots of his Chondrilla. The plant now so called is an inconspicuous perennial plant, of no recorded use.

1630. *Prenanthes.* From πρηνης, drooping, and ανθος, a flower. The heads of flowers of all the species are

11138 Leaves decurrent: lower pinnatifid toothed outwards; upper linear, Stem branched
11139 Lower leaves lanc. runcinate toothed narrowed at base and sessile: upper linear sagittate
11140 Leaves runcinate pinnatifid unequally toothed: floral lanceolate, Flowers racemose
11141 Radic. leaves pinnatif. toothed: cauline linear entire sagittate, Branches 1-flowered
11142 Leaves all pinnatifid: segments linear toothed upwards, Fl. in corymbose panicles

11143 Radic. leaves runcinate: cauline linear entire
11144 Radic. leaves runcinate: cauline undivided filiform, Stem and invol. smooth

11145 Invol. 5-fl. Leaves obl. lanc. amplexicaul. cordate denticulate glaucous beneath
11146 Invol. many-fl. Leaves angular hastate toothed, Flowers nodding racemose panicled
11147 Invol. 5-fl. Leaves 3-lobed stalked angular toothletted rough at edge, Racemes axillary, Fl. nodding
11148 Stem panicled upwards, Leaves stalked cordate toothed ciliated, Panicle lax racemose
11149 Leaves linear tooth-sinuated sessile, Stem shrubby much branched, Branches spiny
11150 Florets 5, Leaves lyrate-pinnatifid and toothed, the terminal lobe with about 5 angles
11151 Leaves pinnated, Leafl. linear filiform, Panicle corymbose stalked, Stem shrubby
11152 Leaves pinnatifid pinnate with linear segments
11153 Leaves pubesc. toothed, those on the stem subsaggitate, Stem panicled corymb. Invol. pyramidal glabrous

11154 Outer scales of the involucre reflexed, Leaves runcinate glabrous toothed
11155 Outer invol. spreading, Leaves runcinate scabrous, Segments round toothletted
11156 Outer scales of the involucre erect appressed, Leaves sinuato-dentate nearly glabrous

11157 Outer invol. spreading, Scales ovate, Scape 1-fl. Leaves obov. bluntish toothed
11158 Outer invol. spreading, Scales ovate-lanceol. Lvs. runcinate pinnatifid glabrous with lin. falc. distant lobes
11159 Leaves pinnatifid to the nerve smooth, Leaves of invol. smooth reflexed

11160 Scape 1-fl. naked thickened and hairy upwards, Invol. hispid, Leaves lanc. obl. somewhat toothed
11161 Scape 1-fl. squarrose thickened and somewhat hairy upwards, Invol. hispid, Leaves lanc. obl. smoothish
11162 Scape 1-fl. naked and invol. smooth, Leaves lanc. runcinate-toothed smooth
11163 Scape 1-fl. nearly naked upward and invol. hairy, Leaves lanc. toothed at base with a few forked hairs
11164 Scape 1-fl. naked smooth. Scales of invol. acute hairy, Lvs. obov. runcin. hairy scabrous, Root tuberous
11165 Scape 1-fl. nearly naked and calyx pubesc. Lvs. lanceol. acute somewhat toothed hoary, Hairs multifid
11166 Scape single-flow. thickened upwards, Leaves glab. runcinato-dentate, Involucre very hairy
11167 Scape branched scaly upwards, Lvs. lanc. toothed or pinnatif. sub-glab. Pedunc. swelling beneath invol.
11168 Scape naked 1-fl. and invol. hairy, Lvs. runcinate pinnatifid hairy, Segm. recurved tooth. Hairs 3-forked
11169 Scape single-flowered, Leaves dentate scabrous, Florets hairy at their orifice glandular at the tip
11170 Stem leafy somewhat branched hairy, Invol. smooth, Leaves lanc. runcinate hairy, Hairs forked
11171 Scape 1-fl. scaly thickened upwards and hairy, Invol. hispid, Leaves runcinate smooth
11172 Scape naked 1-fl. glabrous, Invol. hairy, Leaves runcinate toothed scab. somewhat hairy, Hairs prostrate
11173 Scape naked 1-fl. and invol. smoothish, Leaves pinnatifid-toothed hispid, Hairs simple subulate

and Miscellaneous Particulars.

nodding. Prenanthes serpentaria grows to the height of two feet, bearing pale purple flowers. It is known by the inhabitants of Virginia and Carolina under the name of the Lion's Foot, and is in high esteem as a cure for the bite of the rattle-snake. The juice of the plant boiled in milk is taken inwardly, and steeped leaves, frequently changed, are applied to the wound. It must not be confounded with Prenanthes rubicunda, called False Lion's Foot, which is a less powerful plant.

Prenanthes virgata has a very fine effect in large plantations.

1631. *Leontodon.* So named from λεων, a lion, and οδους, a tooth; in reference to the deep tooth-like divisions of the leaves. The English name *Dandelion*, is a corruption of the French translation of this word, *Dent de lion;* in German *Pfaffenröhrlein* and *Dotterbluhme.* It has been recommended as a winter salad, blanched like Endive; but it possesses too much bitter principle to render it fit for table under any management. *Dent de lion*, Fr., from its cut leaves, and *Piss-en-lit*, in French, and most other European languages, from its diuretic qualities. The tender leaves in spring, used in compound salads, are equal to those of Endive or Succory. The roots, which are fusiform, and abound in a milky juice, are eaten raw as a salad by the French, and boiled by the Germans, like Salsafy and Scorzonera. Dried and ground into powder, they afford a substitute for coffee, in all respects equal to that of Chicory roots. It is a difficult weed to extirpate, because every inch of root will form buds and fibres, and thus constitute a new plant. Swine are fond of it, and goats will eat it; but sheep and cows dislike it, and by horses it is refused.

1632. *Apargia.* Απαργια is the Greek name of a plant now unknown. It has been employed by Dalechamp and Scopoli for a species of Hieracium. At the present day it is given to a genus of weedy plants, with the appearance of Leontodon.

History, Use, Propagation, Culture,

1633. *Thrincia.* From θρίνκος, a feather; in allusion to the feathery pappus of the seeds. Small uninteresting weeds of no value or beauty.

1634. *Picris.* From πικρός, bitter; a name given by the Greeks to some plant resembling Lettuce, on account of its bitterness. None of the species are remarkable for their qualities.

11174 Scape single-fl. Leaves dentate scab. Involucre nearly glab. Outer pericarps with a scaly pappus
11175 Scape 1-fl. pilose, Invol. hoary naked, Leaves lanc. blunt toothed, Hairs forked
11176 Scape 1-fl. hispid, Leaves obl. runcinate toothed hispid, Hairs forked

11177 Stem erect scabrous, Leaves amplexicaul. lanc. toothed, Fl. corymbose, Outer invol. lax
11178 Stem ascending scabrous, Leaves obl. lanc. blunt sinuate pinnatifid, Pedunc. thickened
11179 Leaves obl. lanc. nearly entire sessile, and invol. hispid, Hairs glochidate
11180 Stem branched spreading leafy, Leaves amplexicaul. obl. repand hispid

§ 1. *Scape one-flowered, naked.*

11181 Scape 1-leaved, Invol. hairy, Leaves lanc. runcinate toothed subpubescent, Teeth recurved
11182 Scape somewhat naked villous, Invol. very villous, Leaves lanc. entire acute villous
11183 Scape 1-leaved downy upwards, Invol. cylindr. downy, Leaves lanc. toothletted
11184 Leaves entire ovate downy beneath, Stolones creeping
11185 Scape naked thickened upwards hairy, Invol. smooth, Leaves lanc. obl. somewhat toothed smooth
11186 Scape nearly naked, Invol. hispid, Leaves lanc. spatulate runcinate-toothed smoothish

§ 2. *Scape many-flowered, naked.*

11187 Scape about 4-fl. naked, Leaves obl. blunt entire, Stolones creeping
11188 Scape 1-leaved with about 6 fl. Fl. umb. Leaves lanc. acute entire, Stolones creeping
11189 Scape leafy pilose at base, Fl. corymbose, Peduncles downy, Leaves lanc. acute nearly entire pilose
11190 Scape leafy smoothish, Fl. in corymbose panicles, Pedunc. spreading, Invol. hairy
11191 Scape leafy hispid, Fl. in corymbose panicles, Pedunc. clustered, Invol. hispid
11192 Scape about 3-fl. 1-leaved hairy, Leaves lin. lanc. acute pilose
11193 Scape somewhat naked branched about 3-fl. Pedunc. squarrose, Leaves lin. lanc. toothletted smooth
11194 Scape about 2-fl. Peduncles long, Leaves spatulate lanc. entire pilose, Stolones creeping
11195 Scape forked about 2-fl. and leafy at base, Leaves lanc. acute entire, Stolones O
11196 Resembles H. murorum, but the stem is naked
11197 Scape naked corymbose, Leaves lyrate runcinate hairy
11198 Leaves ovate somewhat toothed, Scape naked racemose, Upper flowers opening first
11199 Scape naked scabrous at base, Fl. in racemose corymbs, Leaves oblong blunt toothletted hairy
11200 Scape leafy hispid, Fl. corymbose, Pedunc. clustered, Leaves obl. acutish pilose-hispid
11201 Scape somewhat naked branched, Invol. with glandular hairs, Leaves oblong acute entire woolly
11202 Scape naked branched, Invol. smooth, Leaves obovate acute entire ciliated, Veins colored
11203 Scape leafy in corymbose panicles, Invol. pubescent, Radic. leaves entire obovate blunt ciliated

§ 3. *Stem leafy.*

A. *Leaves entire.*

11204 Stem erect, Leaves alternate lanc. naked toothed, Panicle capillary
11205 Stem erect branched, Leaves lanc. sessile somewhat toothed glaucous narrowed at each end
11206 Stem erect branched, Leaves lin. lanc. nearly entire narrowed at each end ciliated at base
11207 Stem erect simple, Leaves lanc. cordate amplexicaul. toothletted downy, Fl. racemose corymbose
11208 Stem erect few-fl. Cauline leaves lanc. acum. runcinate: radical obl. lanc. undivided
11209 Stem erect pilose panicled, Leaves ovate oblong subcordate sessile remotely toothed entire at end
11210 Stem erect hairy, Fl. subcorymbose, Cauline leaves oblong lanceolate stem-clasping: radical toothed
11211 Stem erect villous, Lvs. pilose somewhat toothed: radic. obov.; caul. obl. half-amplexicaul, Inv. hirsute
11212 Stem erect branched, Lvs. ovate cord. amplexicaul. toothed towards the base, Pedunc. and invol. hirsute
11213 Stem erect simple furrowed smoothish, Rad. lvs. obl. deeply toothed at base; caul. hastate sagit. Inv. lax

11214 Stem erect panicled furrowed downy, Leaves rugose: upper lanceol. Invol. lax hispid
11215 Stem ascending simple furrowed viscid, Leaves lanc. with recurved teeth, Involucre hispid
11216 Stem erect branched hispid, Leaves lanc. toothed sessile narrowed at each end, Invol. lax hispid
11217 Stem erect about 2-fl. Leaves pilose toothed: radical oblong; cauline lanc. sessile, Invol. villous
11218 Stem cymose fistulous many-leaved, Leaves ovate-lanceolate toothed forwards
11219 Stem cymose solid few-leaved, Leaves lanceolate broadly toothed forwards
11220 Stem erect branched leafy, Leaves linear entire
11221 Stem erect simple leafy 1-fl. Leaves ovate-lanc. toothletted sessile
11222 Radic. leaves oblong and lanceolate bluntish narrowed at base toothletted woolly, Invol. hoary
11223 Stem leafy erect simple, Leaves oblong villous somewhat toothed, Fl. panicled
11224 Stem erect somewhat branched and lvs. villous: radic. obl. lanc. toothed; caul. ovate cord. amplexicaul.
11225 Differs from H. villosum in having the involucrum covered with dense short brown hairs
11226 Radical lvs. lanc. narrowed into stalk: caul. sub-amplexic. toothed backwards acute smooth, Inv. villous
11227 Stem erect smooth below, Leaves sub-villous lanc. acute: radical toothletted, Invol. villous

and Miscellaneous Particulars.

1635. *Hieracium.* It was believed formerly, that birds of prey made use of the juice of this kind of plant to strengthen their vision; whence it was called *Hieracium*, from ἱέραξ, a hawk; the French word *Epervière*, the English *Hawk-weed*, and the German *Habichtskraut*, all bear witness to the universal belief in this very strange opinion. An extensive genus of plants, many of which, especially H. aurantiacum, are objects

History, Use, Propagation, Culture,

deserving cultivation; others are of little interest; but all most difficult to distinguish or characterize. The species appear to intermix with the same facility as roses and willows.

Hieracium venosum, a very pretty plant, is called in America, *Poor Robin's Plantain*, and is believed to possess considerable medical powers.

1636. *Lagoseris.* From λαγος, a hare, and σιρις, a lettuce. Obscure weed-like plants.

11228 Near H. villosum, but the leaves are broader
11229 Stem erect many-fl. Leaves lanc. toothed, Peduncles downy
11230 Stem at base and lvs. here and there covered with hairs, Fls. smaller and inv. less vill. than in H. villosum
11231 Stem erect many-fl. Leaves sessile ellipt. lanc. toothletted smoothish glaucous beneath
11232 Radic. lvs. obl. narrowed at base acute : caul. sub-amplexic. lanc. Pedunc. glandular, Inv. glandul. hairy
11233 Stem erect strigose hispid, Leaves lanceolate nearly entire strigose hispid, Flowers corymbose
11234 Stem pilose warted glandular upwards, Leaves sub-amplexicaul. oblong acute with long hairs beneath
11235 Stem erect branched hoary, Leaves obov. obl. hoary toothed towards the base, Hairs feathery
11236 Stem erect many-fl. Leaves amplexicaul. somewhat rough toothed at edge, Pedunc. downy

11237 Stem densely leafy, Leaves amplexicaul. 3 inches long 1¼ inch wide toothed hairy
11238 Stem erect simple, Leaves ovate cordate amplexicaul. toothletted ciliated, Fl. panicled, Invol. smooth
11239 Stem erect simple, Lvs. ovate-obl. smoothish acute sess. sub-amplexic. toothed towards base, Fls. corymbose
11240 Stem erect branched, Leaves obl. lanc. smooth stalked deeply toothed in the middle, Fl. panicled
11241 Leaves narrowed at base sessile with long points toothed, Invol. downy hoary
11242 Stem erect simple, Leaves linear somewhat toothed, Fl. in corymbose umbels
11243 Leaves broader than in the last and less toothed, Stem few-flowered
11244 Leaves mostly radical with long points toothletted hairy, Invol. hoary with long white and black hairs
11245 Stem branched shrubby, Leaves oblong toothed stalked, Peduncles sub-corymbose, Invol. downy

B. *Leaves sublyrate, lyrate, pinnatifid.*

11246 Stem erect few-fl. Peduncles and invol. pilose, Leaves oblong sub-pinnatifid at base
11247 Stem naked few-fl. Pedunc. and invol. glandular downy blackish, Leaves oblong stalked toothed at base
11248 Stem procumb. branch. at base few-fl. Ped. and invol. downy, Lvs. ovate unequal at base toothletted stalked
11249 Stem erect leafy pilose simple, Fl. panicled, Leaves ovate deeply toothed at base
11250 Stem simple, Leaves smooth obl. narrowed at base runcinate toothed : caul. amplexicaul. Invol. hispid
11251 Stem simple, Cauline leaves lyrate runcinate amplexicaul. hairy, Fl. panicled, Invol. hispid
11252 Stem erect panicled, Leaves ovate stalked deeply toothed at base, Flowers panicled
11253 Stem simple, Leaves smooth : radical runcinate lyrate ; cauline lanceolate, Invol. and pedunc. hispid
11254 Leaves lanc. runcinate roughish, Flowers in umbels
11255 Stem erect leafy simple smooth, Leaves sessile obl. acute finely toothed, Pedicels of panic. in bundles

11256 Leaves pinnatifid crenate, Scape naked few-flowered

11257 Leaves long lanceolate acute repand smooth, Fl. cylindrical, Outer invol. very small
11258 Leaves runcin. toothed smooth, Scape naked many-fl. ascending, Invol. downy : outer scales appressed
11259 Radic. leaves and lower cauline pinnated lyrate, Flowers corymbose, Invol. and pedunc. glandular
11260 Leaves scabrous : radic. lyrate runcinate ; cauline lanc. amplexicaul. toothed at base, Invol. downy
11261 Lower lvs. runcin. pinnatifid : upper entire, Branches naked, Invol. downy with leaflets bristly at the back

11262 Leaves runcin. pinnatifid pilose scabrous, Stem panicled, Leaves of invol. keeled channelled downy
11263 Leaves ovate cordate-sagittate amplexic. toothed, Peduncles long 1-fl. Invol. hispid : outer membranous
11264 Radic. leaves runcinate-lyrate : cauline amplexicaul. lanceol. ; lower pinnatifid, Invol. hispid
11265 Leaves runcinate pinnatifid scabrous sessile : upper lanceol. deeply cut at base, Invol. ovate angular
11266 Leaves amplexicaul. pinnatifid hairy, Leaves of invol. downy hoary flat
11267 Leaves amplexicaul. : lower obl. toothed ; upper cut-toothed, Stem setose hispid, Inv. muricated in fruit
11268 Setose hispid, Leaves runcinate auricled at base : upper lanc. sagitt. hastate, Invol. very hispid

11269 Leaves runcin. lyrate bluntly toothed, Scape naked many-fl. hispid, Lvs. of invol. membranous at edge
11270 Hispid-scabrous, Leaves oblong amplexicaul. remotely toothed, Stem divaricating branched
11271 Leaves rigid scabrous toothed : radic. obovate ; caul. sagittate amplexicaul. Fl. in racemose panicles
11272 Leaves hispid ovate obl. finely and deeply biserrate, Scape naked corymbose
11273 Leaves smooth toothed : radical ovate-spatulate ; cauline oblong sessile, Corymb terminal
11274 Lvs. glab. runcin. : the upper ones linear-sagitt. amplexic. Stem glab. Panic. subcorymb. Inv. pubescent
11275 Leaves lanc. : lower entire toothed smooth ; cauline lanceolate amplexic. Stem furrowed branched
11276 Radic. leaves lanc. runcinate : cauline lanc. toothed at base sagittate, Panicles corymbose
11277 Leaves hispid runcinate pinnatifid : upper sessile lanc. toothed prickly upon the keel
11278 Leaves smooth : lower remotely toothed ; upper nearly entire subsagittate, Invol. downy
11279 Radic. leaves lyrate runcinate ; cauline hastate lanceolate, Branches divaricating, Invol. downy
11280 Leaves pinnatifid : segments linear ; radical toothed ; cauline entire, Stem panicled, Invol. downy
11281 Leaves linear-filiform entire smooth, Pappus sessile

and Miscellaneous Particulars.

1637. *Borkhausia.* Named after Moritz Borkhausen, a German botanist, author of some useful works, especially upon the useful plants of Germany, published in one volume octavo, in 1790. Small annual plants, formerly referred to Crepis.

1638. *Crepis.* A name made use of by Pliny, to designate a plant of which he gives no description. The plants of this genus are common weeds of the hedges of Europe.

History, Use, Propagation, Culture,

1639. *Helminthia.* An abridgment of *Helminthotheca*, a name employed for this genus by Vaillant. It is derived from ἕλμινς, a worm, and θηκη, a case: in allusion to the corrugated seeds, which may be fancied to resemble bundles of little worms. The genus was united by Linnæus with Picris, but has been again separated by modern botanists.

1640. *Myoseris.* So named from μυς μυος, a mouse, and σεριις, lettuce; a name invented for the purpose of maintaining a resemblance in nomenclature with Hyoseris, Lagoseris, and other similar plants.

1641. *Tolpis.* A name invented by Adanson, ahd supposed to have no meaning. Handsome annual flowers.

1642. *Andryala.* A name, the meaning of which has not been discovered. Rather pretty plants, natives of the south of Europe and north of Africa.

1643. *Rothia.* Named by Schreber, in honor of Dr. A. G. Roth, author of a Flora Germanica, in 1788, Catalecta Botanica, in 1797, and other works. It has been united with Andryala by Richard.

1644. *Krigia.* Named after Dr. Krieg, a German botanist, who accompanied Mr. Vernon to America in search of plants. See Vernonia. A pretty little North American plant, with grassy leaves and bright yellow neat flowers.

11282 Involucrum large prickly, Leaves repand

11283 Leaves runcinate pinnatifid: lobes oblong acute toothed spreading, Scape naked many-fl. smooth

11284 Leaves obl. toothed, Pedunc. 1-flowered
11285 Leaves lanc. oblong: lower sinuate-toothed, Pedunc. proliferous
11286 Leaves obl. linear scabrous toothed, Stem branched divaricating, Lower scales of invol. downy

11287 Leaves gland. downy: lower runcinate toothed; upper ovate lanc. entire, Stem and pedunc. glandular
11288 Leaves downy pinnatifid, Invol. downy pilose, Hairs rigid
11289 Leaves pinnated linear downy
11290 Leaves pinnatifid lyrate, Flowers corymbose aggregate, Pedunc. and invol. hispid
11291 Leaves downy oblong: lower toothed, Stem branched, Branches 1-flowered
11292 Leaves ovate woolly: lower somewhat toothed, Corymb terminal, Pedunc. about 2-flowered

11293 Stem branched at base diffuse, Leaves downy ovate lanceolate amplexicaul. nearly entire
11294 Stem erect corymbose, Leaves somewhat downy linear sinuate-toothed sessile: upper entire
11295 Stem erect corymbose, Leaves downy sessile: lower obl. runcinate, Pedunc. gland. villous

11296 The only species

11297 Scapes 1-fl. naked, Leaves smooth lyrate runcinate toothed: term. lobe trifid
11298 Scapes 1-fl. naked, Leaves smooth lyrate runcinate somewhat fleshy: segm. angular imbricated
11299 Scapes 1-fl. naked thickened at end, Leaves lyrate pinnatifid toothed ciliated roughish
11300 Stem branched leafy diffuse, Leaves amplexicaul. oblong toothed scabrous ciliated at edge
11301 Scapes 1-fl. hispid, Leaves obl. runcinate toothed hispid, Hairs forked

11302 Stem diffuse branched, Leaves obl. toothed narrowed at base sessile, Scales of invol. in fruit smooth
11303 Stem diffuse branched, Lvs. obl. toothed narr. at base sess. Scales of invol. in fruit hairy
11304 Stem diffuse branched, Lvs. obl. toothed subcordate amplexicaul. Scales of invol. in fruit smooth
11305 Related to the last, but the leaves are deeply toothed with 3-forked hairs
11306 Leaves somewhat toothed, Hairs simple, Pedunc. very thick
11307 Stem erect branched, Lvs. obl. somew. toothed subcordate amplex. Scales of invol. in fruit alternately setose
11308 Stem erect panicled, Lvs. obl. hispid deeply toothed, Scales of invol. in fruit smooth muricated at the end

11309 The only species

11310 Smooth, Leaves obovate toothed
11311 Hispid, Leaves obovate somewhat toothed
11312 Stinging, Stem branched, Leaves toothed
11313 Radical leaves spatulate toothed pilose, Stem ascending smooth, Pappus stalked

11314 Hairy with very short stellate hairs and bristles, Lvs. lanc. entire, Pedunc. term. thickened upwards 1-fl.

11315 Stem simple leafy 1-fl. Leaves lanc. toothed
11316 Stem almost leafless solitary, Leaves ovate-oblong undivided toothed (spotted above)

and Miscellaneous Particulars.

1645. *Hyoseris.* From ὑς υος, a hog, and σεριν, the Greek name of the Lettuce, or of a plant resembling it: hogs-lettuce, in allusion to the abominably fetid smell of the plant.

1646. *Hedypnois.* Under this name, a kind of wild endive, the medicinal qualities of which he much extols, is described by Pliny. Dalechamp, his commentator, derives the word from ἡδυς, sweet, and πνεω, to breathe, on account of a pleasant flavor communicated to other vegetables in cookery. But the modern genus, which consists of uninteresting weeds, has not been discovered to possess this quality.

1647. *Robertia.* Named by the authors of the Flore Française, after M. Robert, a Corsican botanist. A small weedy plant resembling Dandelion.

1648. *Seriola.* A diminutive of σεριν, chicory. Small chicoraceous weeds of the south of Europe. S. Alliatæ is not, as its name would lead one to suspect, named from any smell of garlic which it possesses, but in honor of Prince Joseph Alliata, a Sicilian nobleman, and patron of Bivona Bernardi.

1649. *Soldevilla.* So named by Lagasca, apparently in honor of some botanist. A little Spanish weed with terminal solitary flowers.

1650. *Hypochæris.* From ὑπο, for, and χοιρος, a pig; *Porcelle*, Fr., for the same reason, viz., that pigs eat the roots with avidity. All the species are uninteresting weeds.

History, Use, Propagation, Culture,

1651. *Lapsana.* From λαπαζω, to purge. The Lapsana, says Pliny, gently relaxes the body. L. communis is called *nipple-wort*, in English, and *herbe aux mamelles*, Fr., having been formerly applied to the breasts of women to allay the irritation occasioned by nursing.

1652. *Zacintha.* A plant growing in the island of *Zacintha* or Zante. It was formerly included in Lapsana, under the name of L. Zacintha.

1653. *Rhagadiolus.* From ραγας, a slit; each division of the calyx being hollowed out in the middle so as to resemble a furrow, or little gutter.

1654. *Moscharia.* This plant gives out an agreeable smell of *musk.* An annual plant, with stem-clasping pinnatifid deeply cut leaves, found in sandy waste places in Chili, where it is commonly called *Almizelillo.*

1655. *Catananche.* Vaillant explains the meaning of this word, by deriving it from the two Greek words, κατα, and αναγκη, necessity: that is to say, a plant which compels admiration. What is certainly known of its origin is, that it was employed by Dioscorides to designate a plant used by the women of Thessaly, in philtres and love potions. The modern genus, which contains two or three species of ornamental border annuals, can have no reference to that of the ancients, one kind of which is believed to have been Ornithopus compressus, and another Astragalus pugniformis. John Bauhin calls Lathyrus Nissolia by the name of Catananche leguminosa.

1656. *Triptilion.* A genus instituted by the authors of the Flora Peruviana, and named from τρεις, three, and πτιλον, a feather, on account of the three divisions of the pappus. The species mentioned above is a very pretty little annual, or rather biennial plant, flowering during all the winter months in any place whence frost is excluded, but it requires not to be kept too dry. There is a fine species in Chili, with bright blue flowers, but it has not been yet introduced. The inhabitants of South America employ the flowers of the different species as everlasting flowers, for which their dryness renders them very well adapted.

1657. *Cichorium.* In Greek κιχωρη. De Theis's remarks are upon this subject excellent. Bodæus, he observes, Linnæus, and others, have derived this name from κιω, to come, and χωριον, the field; that is to say,

11317 Leaves toothed roughish, Involucre hispid, Pappus of disk stipitate plumose: of the ray sessile setose
11318 Hispid, Calyxes hairy, Stem branched, Lvs. lanc. toothed
11319 Nearly glab. Involucre obl. imbricated, Stem branched somewhat leafy, Radical leaves dentato-sinuate
11320 Stem branched leafless glab. Pedunc. with small scales, Lvs. runcinate obtuse scab.
11321 Different from the last in having a smooth involucrum

11322 Stemless, Scape 1-fl. Leaves runcinate pinnatifid, Terminal lobe rhomboid

11323 Scape branched very thick and fistulose upwards, Leaves obovate oblong toothed

11324 Involucre of the fruit angular, Stem panicled, Pedunc. slender, Lvs. ovate petiolate angulato-dentate
11325 Caulescent branched, Leaves ovate stalked doubly toothed
11326 Caulescent branched, Lvs. angular-toothed: lower lyrate-pinnatifid, Pedunc. and involucre smooth
11327 Caulescent panicled, Stem downy below, Radical leaves lyrate toothed: upper lanc. entire

11328 Rad. leaves lyrate acute, Cauline sagittate amplexicaul. toothed

11329 Fruit smooth spreading, Cauline leaves lanc. undivided
11330 Fruit smooth spreading, Leaves lyrate
11331 Fruit prickly spreading, Leaves linear lanc. entire

11332 Leaves amplexicaul. pinnatifid: segments deeply jagged

11333 Lower scales of involucre ovate mucronate, Leaves villous linear sub-bipinnatifid at base
11334 Lower scales of involucre lanc. Leaves lanc. toothed 3-nerved

11335 Leaves cordate spiny

11336 Flowers sess. axill. in pairs, Leaves runcinate
11337 Flowers axillary twin sessile, Leaves obovate toothed
11338 Pedunc. axill. twin: one long 1-fl.; the other very short about 4-fl. Flowers capitate
11339 Pedunc. axill. twin: one long 1-fl.; the other very short about 2-fl. Stem dichotomous, Rad. lvs. runcinate
11340 Flowers axill. solitary, Stem dichotomous, Branches naked spiny, Lvs. lanc. runcinate toothed

11341 Leaves obovate mucronate cartilaginous, Flowers solitary

11342 Fl. solitary lateral sessile, Lvs. decurrent, Stem subsimple villous erect
11343 Fl. solitary, Lvs. roughish smooth, Stem winged toothed
11344 Fl. subaggregate, Lvs. scabrous with the middle rib below hairy interruptedly decurrent

and Miscellaneous Particulars.

it is a plant found wild in fields, — which grows every where: but this etymology is overstrained. It is much more natural to suppose that the Egyptians, who used this plant in great quantities, would have communicated to the Greeks, along with the manner of using it, the name by which it was known in Egypt, which appears from Forskahl to be *chikoûryeh*. Pliny remarked, that the Egyptians made their chicory of much consequence, and it is very well known that, at the present day, chicory or similar plants constitute half the food of the common people in Egypt. In like manner, there can be little doubt that the specific terms Endivia and Intybus, are both derived from the Arabic name *hendibeh*.

The leaves of Cichorium Intybus are employed by the French under the name of *Barbe du Capucine*, as a kind of winter salad; for which purpose the leaves are blanched like Endive. The most common method of cultivating the plant, is to sow the seed in drills in the end of July, and to keep the plants about six inches apart, and quite free from weeds. In the winter the roots are taken out of the ground and packed up in a warm cellar among earth, in layers, like bottles in a wine cellar, the crowns only of the roots being exposed. In a few days, young leaves are produced in great abundance, from the situation in which they are cultivated quite blanched, and, if not grown too rapidly, with an agreeable taste. There is also a variety of C. Intybus, called *Chichorée à café*, which is cultivated extensively in France for the sake of its roots, which are taken up in the winter season, cut into squares, dried artificially, and afterwards, being roasted, are ground along with their coffee, for which they serve as an adulteration. There are those, however, who assert, that it is to this admixture of Succory root that the superior flavor of the French to the English coffee is to be attributed.

1658. *Bacazia.* Named by the authors of Flora Peruviana, in honor of George Bacas, professor of botany at Carthagena.

1659. *Scolymus.* The Greek name of a spiny plant, which appears to have been the modern artichoke. The word itself is derived from σκολος, a spine. S. hispanicus has simple fusiform roots, soft and sweet like Scorzonera, and equally good to eat. The leaves and stalk also abound with a milky juice, and the people of Salamanca eat it in the same manner as Cardoons. The flowers are used for adulterating saffron.

History, Use, Propagation, Culture,

1660. *Arctium.* From ἄρκτος, a bear, (*arth*, Celtic); on account of the rough bristly fruit, which may be compared to the coarse hair of a bear. Lappa is derived from *llap*, a hand, in Celtic, because it lays hold of every thing near it. The burdock is too familiar to every schoolboy to need illustration. It is equally common in Europe and Japan, by road sides and on ditch banks. Few quadrupeds, except the ass, will eat the plant; but birds feed on the seeds, and snails and caterpillars on the leaves. The stems, stripped of their rind before the flowers appear, may be eaten, either boiled or raw, with oil and vinegar. Withering says, a decoction of the roots is esteemed by some equal to that of Sarsaparilla. Burnt green, between the time of flowering and seeding, three pounds of the ashes produced sixteen ounces of very white alkaline salt, as good as the best potash.

1661. *Serratula.* A diminutive of *serra*, a saw; the leaves being edged with cutting teeth. Plants with the habit and qualities of thistles. Serratula tinctoria dyes cloth of a yellow colour.

1662. *Saussurea.* Named in honor of the celebrated Swiss philosopher Horace Benedict de Saussure, who, among his other acquirements, possessed a considerable knowledge in botany. He died in 1799, in the fifty-ninth year of his age.

1663. *Carduus.* This word appears to be derived from *ard*, a point, in Celtic, in allusion to the numerous

11345 Leaves cordate petiolate
11346 Cauline leaves cordate stalked entire, Involucre cobwebbed downy
11347 Involucre woolly: inner scales subulate somewhat colored scarcely longer than outer, Racemes axillary paniculed

11348 Leaves sharply serrate glabrous pinnatifid: the terminal lobe the largest, Flowers in a small clustered umbel
11349 Leaves serrated unequally pinnate of about 5-pairs, Pinnæ confluent, Peduncles 1-flowered, Flowers rayed
11350 Leaves serrated unequally pinnate of about 2-pairs, Pinnæ confluent, Peduncles 1-flowered, Inner scales of involucre long
11351 Leaves linear lanceolate hirsute revolute at edge, Stem 1-flowered villous, Scales of involucre ovate-lanceolate appressed [colored
11352 Leaves linear entire hirsute, Flowers terminal corymbose
11353 Leaves linear entire downy beneath revolute at edge, Corymb fastigiate
11354 Leaves pinnatifid oblique acute smooth unarmed, Scales of involucre mucronate: inner scarious
11355 Leaves pinnatifid: lobes distant, Stem nearly simple 1-flowered, Involucre globose squarrose
11356 Like S. tinctoria, but the lower leaves are oval and entire
11357 Leaves pectinate-pinnatifid naked: segments linear unarmed; terminal ovate, Scales of involucre ovate mucronate
11358 Involucre unarmed somewhat awned radiate, Leaves pinnatifid
11359 Leaves ovate pinnatifid toothed unarmed hoary beneath: upper sessile. Stem 1-flowered, Scales of involucre ovate unarmed
11360 Leaves linear entire downy beneath, Corymb nearly simple, Involucre oblong ovate downy
11361 Involucre ovate: scales roundish scarious at edge, Leaves lanceolate lower somewhat toothed at base
11362 Stem somewhat downy, Leaves oblong acute narrowed at base serrated, Flowers subsessile, Involucre unarmed
11363 Leaves downy beneath somewhat toothed: radical cordate stalked, Cauline lanceolate decurrent, Involucre squarrose

11364 Involucre corymbose somewhat downy, Leaves fleshy smooth: radical lyrate hastate, Cauline hastate
11365 Leaves villous beneath toothed: radical ovate-lanceolate. Flowers terminal somewhat umbelled
11366 Leaves downy beneath toothed: radical ovate-subcordate; cauline ovate-lanceolate. Flowers terminal somewhat umbelled

11367 Leaves decurrent toothed spiny, Peduncles naked very long 1-flowered. Involucre spiny inclining
11368 Leaves half decurrent oblong spiny-toothed somewhat fleshy smooth glaucous beneath, Peduncles very long 1-flowered.
11369 Leaves oblong decurrent sinuate spiny with white veins villous beneath, Flowers sessile clustered, Involucre cylindrical.
11370 Leaves decurrent spinous, Flowers drooping, Scales of the involucre lanceolate cottony: outer ones spreading
11371 Leaves decurrent pinnatifid downy: segments palmate spiny, Flowers clustered
11372 Leaves decurrent runcinate spiny, Peduncles somewhat downy 1-flowered. Involucre ovate mucronate unarmed
11373 Leaves decurrent sinuate spiny smooth, Peduncles short subcorymbose downy
11374 Leaves decurrent spiny glabrous, Peduncles erect 1-flowered, unarmed
11375 Leaves decurrent sinuated spinous, Involucre globose nearly sessile: its scales linear slightly recurved [lanceolate erect
11376 Leaves decurrent sinuated spinous somewhat cottony beneath, Involucre nearly cylindrical clustered sessile their scales
11377 Leaves decurrent oblong sinuated spiny at edge downy beneath, Flowers stalked clustered terminal
11378 Leaves decurrent lanceolate pinnatifid toothed spiny villous beneath, Peduncles 1-flowered downy, Scales of involucre subulate spiny
11379 Leaves half decurrent lanceolate pinnatifid spiny downy beneath, Peduncles scaly downy
11380 Cauline leaves half decurrent oblong undivided spiny toothed subvillous beneath: radical pinnatifid at base
11381 Leaves decurrent sinuated ciliated naked beneath, Flowers stalked heaped
11382 Leaves half decurrent pinnatifid toothed spiny white with down beneath, Flowers subsessile terminal clustered
11383 Leaves half decurrent toothed sinuate spiny smooth, Flowers paniculed
11384 Leaves decurrent pinnatifid sinuated downy spiny, Peduncles naked downy, Involucre deciduous
11385 Leaves downy beneath: upper finely decurrent linear. Stem 1-flowered. Scales of involucre lanceolate mucronate downy
11386 Leaves decurrent deeply pinnatifid: segments toothed upwards spiny with setaceous ciliæ at end
11387 Leaves half decurrent pinnatifid acuminate: segments 2-lobed ciliated spiny, Peduncles downy
11388 Leaves half decurrent pinnatifid-serrate somewhat spiny ciliated naked: radical undivided, Peduncles very long
11389 Leaves adnate at base lanceolate naked eroded ciliate-spiny unarmed [woolly
11390 Leaves unarmed: radical ovate toothed somewhat cut at base; cauline sessile pinnatifid linear
11391 Leaves naked: radical oblong entire; cauline lanceolate somewhat toothed, Scales of involucre ovate mucronate

and Miscellaneous Particulars.

points with which it is beset. C. marianus, the milk-thistle, derived its name from the Virgin Mary, some of whose milk is said to have fallen upon the leaves of the plant, and changed them to white. An extensive genus of rather handsome weeds. C. Personata is said to have been so called, because its ample leaves were formerly used as a mask (*persona*). Some of the gigantic species make handsome ornaments for the shrubbery, but the greatest number are nuisances to the husbandman; some on account of their deep vivacious roots, which cannot be eradicated without extreme difficulty; but the greater number because of their bulky herbage, and the extensive dissemination of their seeds by the wind.

The footstalks of the leaves of most or all of the species of this and the allied genera might be eaten in the manner of Cardoons, if similarly blanched. The dried flowers of C. arabicus and nutans will curdle milk. The seeds of all the species of Serratula, Cnicus, Onopordum, and similar genera, are greedily eaten by small birds, especially the finches.

The Carduineæ of M. Cassini differ from Carlineæ of the same author, in the filaments being hairy or papillose, from Centaurieæ in the structure of ovarium and of pappus, and from Echinopseæ, to which they bear a general resemblance, by many very important characters. The species inhabit Europe, Asia, and Africa; there are scarcely any in America, and none in the southern hemisphere.

History, Use, Propagation, Culture,

1664. *Silybum.* A name under which Greek writers describe a plant not well known at present. Sprengel refers it to S. marianum. This plant was formerly cultivated, and the young leaves used in spring as a salad, or boiled as pot greens; the young stalks, peeled and soaked in water, to extract a part of their bitterness, were also eaten, and were said to be excellent. In the spring of the second year, the root is prepared like salsafy or skirret; and the receptacle of the flower is pulpy, and eats like that of the artichoke. In Apulia the whole plant is much used as fodder for cattle.

1665. *Cnicus.* This is a name under which Dioscorides describes a prickly rough plant; derived from κνιζω, to prick. It is now referred to a tribe of plants having such characters in an eminent degree. Acarna and Erisithales are both names by which the ancients distinguished plants, either the very same as those now so called, or very similar to them. The tender stalks of C. palustris, as of most of the species, being peeled, are eatable either raw or boiled. C. arvensis is well known as one of the most troublesome weeds in arable land. It is never found, however, in very sandy, gravelly, or peaty soils; but generally in such as are loamy and dry. An instance is given in the Farmer's Magazine, of the descending roots of this plant having been dug out of a quarry nineteen feet long; nor is it less remarkable for its horizontal roots. Mr. Curtis planted about two inches of a root in his garden in April, and by November following it had thrown out under ground stolones on every side, some of them eight feet long; some of these stolones had thrown up leaves five feet

11392 Lvs. amplexicaul. waved spinous : radic. ones pinnati. Scales of invol. subfoliac. recurved spinous at margin

11399 Lvs. subdecurr. pinnatif. : segm. 2-lobed spreading spiny vill. beneath, Invol. hemispher. sessile
11400 Lvs. amplexicaul. hispid pinnatif. : segm. 2-lobed spreading spiny downy beneath, Invol. ovate
11401 Leaves sess. pinnatif. every other segm. pointing upwards spin. scabr. Involucres spherical woolly
11402 Leaves sess. pinnatif. hairy downy beneath: segm. 2-lobed spreading spiny, Invol. globose with cobweb down
11403 Leaves sess. obl. lanc. scabrous downy beneath toothed ciliated : radic. pinnatifid, Invol. bracteate ovate
11404 Leaves sess. lanc. waved at the edge and unequally spin. pubesc. cottony beneath, Flowers mostly solitary
11405 Lvs. amplexic. lanc. ciliato-dentate undivided or laciniated white and downy beneath, Fl. mostly solitary
11406 Lvs. subcordate amplexicaul. lanc. ciliated downy beneath : lower somewhat cut, Fl. clustered
11407 Lvs. lanc. sessile ciliated strigose beneath : radical sinuated, Scales of invol. recurved at end
11408 Lvs. pinnatifid with strong spines somewhat downy beneath, Fl. sess. aggregate, Lvs. of invol. spiny
11409 Lvs. half decurr. obl. sinuate toothed spiny hoary beneath, Heads close together with appressed scales
11410 Leaves half decurrent lanc. entire ciliated, Pedunc. very long 1-fl. woolly
11411 Very like C. arvensis, but the leaves are decurrent
11412 Stem somew. downy, Lower lvs. sinuate-toothed with strong spines rough above finely downy beneath
11413 Lvs. amplexic. hispid pinnatifid : segm. 2-lobed spreading spiny downy beneath, Heads ov. glabrous spiny
11414 Lvs. amplexic. hispid pinnatif. : segm. 2-lobed spread. spiny downy beneath, Heads ov. cobwebbed with down
11415 Lvs. amplexic. hispid pinnatif. : segm. 2-lobed spread. spiny beneath naked subvillous, Heads ov. cobwebbed
11416 Lvs. amplexic. hispid pinnatifid : segm. 2-lobed spreading spiny naked beneath, Heads ov. glabrous
11417 Lvs. amplexicaul. hispid pinnatifid prickly : segm. angular lobed spiny, Heads nodding cobwebbed
11418 Stem branched many-fl. Heads terminal solitary spiny at base, Lvs. amplexicaul. sinuate toothed spiny
11419 Leaves sess. pinnatifid hispid woolly beneath : segm. 2-lobed spreading spiny, Invol. ovate woolly
11420 Leaves sess. lanc. cut-toothed : radical. pinnatifid, Scales of invol. ovate lanc. membranous at edge
11421 Leaves ciliate spiny downy beneath : lower stalked obl. acum. subsinuate ; upper pinnatifid auricled
11422 Like the last, but the leaves of involucrum are reflexed
11423 Leaves obl. smooth serrulate with bristly ciliæ blunt mucro. Stem corymbose
11424 Leaves unarmed sess. obl. toothed : radical undivided and pinnatifid, Invol. scarious villous
11425 Leaves sess. pinnati. spin. Stem panicled, Invol. ovate, Scales appressed mucronated

11426 Leaves toothed ciliated naked : cauline amplexicaul. : lower and radical pinnatifid, Fl. clustered capitate
11427 Leaves amplexicaul. ovate sublyrate ciliate serrate scabrous : radic. lyrate, Fl. clustered
11428 Leaves amplexicaul. obl. lanc. toothed ciliate-spiny, Pedunc. 1-fl. Invol. bracteate
11429 Leaves sess. pinnatifid : segm. cut serrate spiny at edge, Invol. bracteate : scales ovate appressed
11430 Leaves cordate amplexicaul. ovate obl. toothed ciliated : radical obl. blunt ciliated sinuate
11431 Leaves amplexicaul. cord. pinnatif. ciliate serr. Fl. terminal subracemose bracteate, Bractes colored ovate
11432 Leaves amplexicaul. obl. pinnatif. toothed spiny hispid above downy beneath, Term. fl. sess. axill. stalked
11433 Leaves amplexicaul. pinnatif. toothed spiny glabrous, Fl. term. aggreg. sess. surrounded by colored bractes
11434 Leaves amplexicaul. pinnatifid ciliated, Pedunc. cernuous, Invol. glutinous : scales lanc. spreading
11435 Leaves amplexic. pinnati.-downwards ciliated : pinnæ lanc. 3-nerved ; upper confluent, Pedunc. cernuous
11436 Leaves amplexicaul. pinnatifid ciliate-spiny : segm. 2-lobed toothed upwards at the base
11437 Stemless, Invol. glabrous
11438 Leaves sess. lanc. entire downy beneath with triple spines at the edge, Fl. axill. sessile
11439 Leaves sess. lanc. downy beneath subrepand : lobes emarg. with 2 spines, Fl. stalked subcorymbose

and Miscellaneous Particulars.

from the original root. The whole together, when dug up and washed, weighed four pounds. In the spring following, it again made its appearance, on or about where the small piece was originally planted. There were between fifty and sixty young plants, which must have sprung from fragments of the roots that had eluded the gardener's search, though he was particularly careful in extracting them. From these facts it may readily be conceived how difficult it is to eradicate this weed from arable land; a naked fallow, with frequent and deep ploughing, will not accomplish it, unless the season is more than usually dry. Laying land down to grass, keeping it in that state seven or eight years, and during the whole time pulling up every shoot as soon as it appears, is found fully more effectual than a naked fallow. But the plant is so common by road sides, and seeds so abundantly, that it is hardly possible to effect its extermination. In common field lands, and others indifferently cultivated, it often forms the larger half of the produce, and formerly used to be pulled when beginning to come into flower, and given as food to horses and cows. Those who pull this weed require to be furnished with strong gloves, or thistle pincers. (*Ency. of Agr.* § 2394.) Some English botanists seem doubtful if horses and cows will eat it; but those who know any thing of the history of agriculture in Scotland will recollect, that before the introduction of naked fallows and turnips, it formed the *suppering* of housed cattle, during five or six weeks of every summer. The ashes of the plant yield a very pure vegetable alkali. C. canus has fleshy white roots like the skirret, and may be dressed and eaten

History, Use, Propagation, Culture,

in the same manner. C. lanceolatus is one of the most common and noxious weeds of the genus, chiefly on account of its great bulk, its numerous downy seeds, and the facility with which they are distributed by the wind: its dried flowers curdle milk. C. helenioides, used to be called the melancholy thistle, and was used by quacks as a cure for madness. C. Casaubonæ is so named after Casaubona, herbarist to the Grand Duke of Tuscany, who sent the seed to John Bauhin. C. syriacus is spotted with white, as are a number of Egyptian plants. C. oleraceus, according to Schreber, is not eaten by cattle; but the Russians are said to boil the leaves in the spring, and eat them as coleworts. The tender stalks of C. cernuus are so used in Siberia.

1666. *Onopordum.* A name employed by Pliny for a plant which he describes too imperfectly to be recognized now. The virtues which he ascribes to it, and whence the name has been derived (ονος and πεδω), certainly have no existence in the modern genus, which consists of noble thistle-like plants, that, if allowed plenty of room, form very magnificent specimens of annual vegetation. O. acanthium (from its leaves being like those of the Acanthus) was formerly used like the artichoke and Cardoon. The seeds of this plant, unlike those of other thistles, are strongly defended by the calyx, and are not subject to be blown about by winds. The whole plant is white, tomentose, and one of the most magnificent of the family.

1667. *Berardia.* So named by Villars, after M. Berard, a botanist of Grenoble.

1668. *Cynara.* Said to be derived from κυων, a dog, on account of the stiff hard spines of the involucrum, which resemble the teeth of a dog. The English word *Artichoke* is said to be derived from the Celtic *art*, a spine, and *chaulx*, a cabbage; but it must be confessed that the word is very like the Arabic name of the plant, *Carcioffo* or *Kharchiof*. C. scolymus is a well known garden esculent. In some parts of France and Italy it is eaten raw in its wild state by the common people. According to Gerarde, it was introduced into this country from Italy, but is become, "by reason of the great moisture which our country is subject unto," greater and better than those of Italy; a circumstance not to be doubted, and applicable to many other plants of culture; for it is a fact, that art can in many cases surpass nature; always, however, working upon nature's principles. The artichoke is one of those plants the most patient of drought, and in this unusually dry and hot season (1825) was almost the only vegetable procurable in the neighbourhood of Paris, during three or four weeks in July and August. Once in the seventeenth century, and again about 1789, most of the artichokes in England were destroyed by frost, but replaced from France. There are three varieties in cultivation, the conical, French, or oval; the globe, which has a large dusky purplish head; and the dwarf globe, a prolific variety, which is smaller. The parts used are the lower part of the leaves of the calyx; the fleshy receptacles of the flower, freed from the bristles and seed down, vulgarly called the choke; and some-

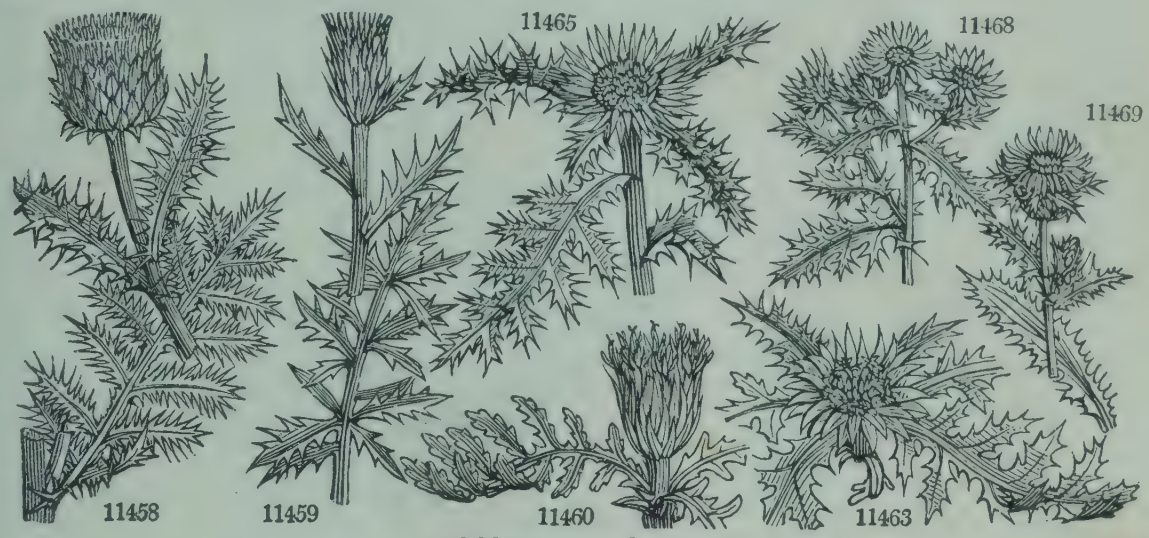
11471 Stem many-fl. Leaves decurrent



and Miscellaneous Particulars.

times the tender central leafstalk in a blanched state like the Cardoon. Medicinally, the plant is reputed to be aperient, stomachic, and somewhat heating. It is said to dye a good yellow, and the flowers curdle milk.

The plant is propagated by suckers in March and April, and requires a light rich soil, well dunged, and pulverised to a good depth. The leaves being large, the plants are placed in rows at four feet distance, and two feet apart in the row. They will produce some heads the first season, a full crop the next, and, if well manured, will last for five or six years. The plants require to be covered a foot thick with litter during winter, which is removed, and the ground dressed in March and April. The heads will appear in the beginning of June.

When the artichoke is to be cultivated as Cardoon, the plants are to be cut over by the surface about midsummer; in September they will have produced leaves about two feet high; they are then bound close with a wreath of hay or straw, and earth drawn round them. The blanching will be perfected in a month or six weeks.

Bauhin thought the Cardoon a hybrid from the common artichoke, to which it bears a great resemblance. The tender stalks of the inner leaves, rendered white and crisp by earthing up, are used for stewing, and for soups and salads during winter, like celery. It requires the same soil as the artichoke, to be planted at three or four feet apart in May, or sown where it is to remain in March. In September the leaves may be tied together and earthed up, and in October and November they will be blanched from one to three feet in length.

With the florets of Cynara Cardunculus, which the Portuguese call *Cardo do coalho*, milk was formerly coagulated by the people of Portugal, as it is by rennet in England.

1669. *Carlina.* Olivier de Serres says, this plant was named after the famous Charlemagne, whose army was cured of the plague by means of this plant. Linnæus ascribes the name to the Emperor Charles V., whose army was relieved from the plague in Barbary in the same way. C. acaulis has black woody roots an inch thick, the upper part of which, with the receptacle of the flower, when tender, may be eaten, but the root of the adult plant becomes acrimonious, and is recommended as an alexipharmic. It contains an acrid resinous principle, by which it stimulates the solids, dissolves the humours, and promotes perspiration. C. vulgaris is found all over Europe in dry barren soils. The flowers expand in dry, and close in moist weather, retaining this property a long time.

Upon this and a few other genera M. Cassini has founded a tribe, which he denominates Carlineæ, which although possessing no very precise characters of difference, is, he believes, distinct from both his Centaurieæ and Carduineæ, from which it may always be distinguished by the perfect smoothness of the filaments. The species of Carlineæ are found in every part of the world.

History, Use, Propagation, Culture,

1670. *Atractylis.* Vaillant (*Mem. Acad. Sc.* 1718.) derives this from ατρακτος, a distaff, because the light stems were very fit to make spindles.

1671. *Acarna.* A name under which Theophrastus describes a plant resembling a thistle. Willdenow applied it to the present genus, which consists of thistle-like plants.

1672. *Stokesia.* Named in honor of Jonathan Stokes, M.D., well known as the coadjutor of Dr. Withering in his botanical arrangement of British plants. A perennial plant, with large handsome blue flowers.

1673. *Stobæa.* Named after Dr. Stobæus, of Lund, one of Linnæus's earliest patrons, and said to have been a practical naturalist.

1674. *Onobroma.* From ονος, an ass, and βρωμη, food, in allusion to the worthlessness of its herbage. Thistle-like plants of little beauty.

1675. *Carthamus.* From its Arabic name *qortom*, a word which signifies to paint, on account of the fine color yielded by the flowers. Tournefort, with little reason, derives it from the Greek καθαιρειν, to purge. The flowers of Carthamus tinctorius are used by the Chinese to give some of the fine rose, scarlet, purple, and violet colors to their silks. For this purpose, the flowers are thrown into an infusion of some alkali, and left to macerate; the colors are afterwards drawn out by the addition of lemon juice in various proportions, or of any other vegetable acid.

It is cultivated at present in many parts of Europe, and in the Levant, whence great quantities are annually imported into England for dyeing and painting. In Spain it is grown in gardens, as Marygolds are in England, to color soups, olives, and other dishes. The Jews in Poland are remarkably fond of it, and mix it with their bread, and most of their viands. According to Houghton, it was formerly cultivated in Gloucestershire, both for the flowers and seed. The common people took it for saffron, and used it in their puddings, cakes, and

11472 Stem and leaves smooth

11473 Stemless, Leaves pinnatifid, Outer leaves of invol. tricuspidate
11474 Stem branched, Leaves lanc. ciliate toothed downy, Outer leaves of invol. setaceous pinnatifid conniving [larger than flower

11475 The only species

11476 Leaves downy pinnatifid: pinnæ linear terminated by a spine

11477 Stem about 1-fl. Leaves ovate lanc. spiny-toothed

11478 Stem shrubby, Leaves sessile lanceolate downy beneath spiny-toothed, Branches 1-flowered

11479 Stem quite smooth, Leaves ovate entire spiny toothed, Fruit naked
11480 Stem woolly, Lower leaves pinnatifid toothed: upper amplexicaul. pinnatifid toothed spiny
11481 Stem smoothish, Invol. somewhat woolly, Lower leaves lyrate: upper half-amplexicaul.
11482 Radic. leaves pinnated: cauline pinnatifid, Stem 1-flowered
11483 Leaves unarmed: radical toothed; cauline pinnate
11484 Cauline leaves linear pinnated as long as plant
11485 Leaves ensiform sinuate toothed

11486 Spiny much branched with small blue flowers

11487 Leaves sessile linear toothletted downy beneath, Inner scales of invol. lanc. long
11488 Leaves stalked ellipt. blunt entire silky with down beneath
11489 Leaves lin. clustered very long revolute at edge hoary beneath, Branches downy

11490 The only species

11491 Leaves scattered and fascicled filiform ciliated, Leaves of invol. ciliated, Hairs of recept. clustered
11492 Lvs. scattered and fascicled filiform subciliate at base, Lvs. of invol. entire, Holes of recept. multipartite
11493 Leaves connate linear filiform glabrous, Scales of invol. ovate, Stem wavy, Fl. terminal in threes stalked
11494 Leaves ovate powdery downy, Scales of invol. ovate entire
11495 Leaves ovate smooth, Scales of invol. ovate mucronate membranous

11496 Leaves lanc. scabr. serrulate, Corymb fastigiate, Scales of invol. filiform at end
11497 Leaves ovate-lanc. serrate downy beneath, Corymb fastigiate, Scales of invol. ovate acuminate
11498 Stem simple, Lvs. many long and narrow lin. nearly entire, Corymb somewhat umbell. Scales of inv. stiff
11499 Leaves oblong acuminate serrate, Corymb fastigiate, Scales of invol. ovate acute [mucronate
11500 Leaves linear-lanc. silky beneath downy on each side nearly entire, Flowers alternate 1-sided sessile
11501 Stem straight dichotomous upwards: branches flexuose, Heads in the forks of the branches sessile

and Miscellaneous Particulars.

bread; but by putting in too great a quantity they found it communicate a purgative quality, and gave up its use. It is still, however, used in this way by some pastrycooks. In Germany it is cultivated on light land well pulverised; it is sown in rows about eighteen inches distance, and afterwards thinned to three or four inches apart in the row: in September the plants begin to flower, and the field is then gone over once a week, for six or seven weeks, to gather the expanded florets, which are dried in a kiln in the same manner as true saffron. Turkeys and geese are said to feed greedily on the seed, and in a short time become very fat.

C. lanatus is used by the women of the south of France and Spain for distaffs, and hence it had the name of distaff thistle. The root of C. carduncellus is eaten in Africa.

1676. *Cardopatum.* A name of unknown meaning. A spiny branched plant with little blue flowers, formerly referred to Carthamus.

1677. *Stæhelina.* One Benoit Stæhelin, a Swiss botanist, published, in 1730, an academical dissertation upon the Filicula saxatilis corniculata and the Equisetum. These are pretty half-shrubby thread-leaved plants, mostly deserving cultivation.

1678. *Palafoxia.* Named by Lagasca, after the Spanish General Palafox, of whose merits as a botanist we are uninformed. A small perennial plant with the habit of Stevia.

1679. *Pteronia.* From πτερον, a wing; altered by Linnæus from the Pterophorus of Vaillant, a word which seems to allude to the feathery scales of the receptacle. A genus of humble rigid shrubs.

1680. *Vernonia.* Named after Mr. William Vernon, fellow of St. Peter's College, Cambridge, who travelled in North America in search of plants, and left behind him an Herbarium, which came into the hands of Sir Hans Sloane, and contributed to enrich the third volume of Ray's Historia Plantarum. Vernonieæ constitutes the twentieth of M. Cassini's subdivisions of Compositæ. They are distinguished from Lactuceæ by

Eriopáppus paniculátus Hort.

History, Use, Propagation, Culture,

their corolla, which is not ligulate, and from every other tribe by their style, which is absolutely the same as that of Lactuceæ. The greater part of Vernonieæ are found in America; a few in Asia and Africa, but none in Europe.

1681. *Ammobium.* From *αμμος*, sand, and *βιω*, to live, in allusion to the places where it grows. A pretty half-hardy New Holland herbaceous plant, with dry white involucral scales, like a Gnaphalium.

1682. *Liatris.* A word of unknown meaning. A genus of charming North American herbaceous plants. They should be taken out of the borders in the autumn, and preserved in pots till the succeeding spring. Of Liatris odoratissima, the leaves when dry give out a very pleasant smell resembling Vanilla, and which lasts for years. It is called the Carolina Vanilla plant.

Liatris squarrosa is a very handsome species, with large heads of most beautiful flowers of a rich purple. It and L. scariosa are known in North America under the name of rattlesnake's master. In case of being bitten by this reptile, the bruised bulbs of the plants are applied to the wound, while, at the same time, a decoction in milk is taken inwardly.

11502 Leaves oval blunt serrate-crenate : lower with a winged amplexicaul. stalk, Fl. subcorymbose
11503 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bractes reflexed
11504 Leaves ovate-lanc. narrowed at each end serrated roughish pubescent beneath, Fl. term. about 3

11505 Leaves oblong wavy decurrent

11506 Stem simple pubescent, Leaves very long linear nerved roughish at edge, Racemes few-fl. leafy
11507 Stem simple pubescent, Lvs. lanc. narrowed at each end smooth rough at edge, Inv. squarrose at bottom
11508 Stem simple pubescent, Leaves smooth : lower stalked broad-lanc. Involucre subglobose with scarious scales
11509 Stem simp. vill. Lvs. lin. subfalc. dott. rough, Spike somew. leafy, Pedic. short, Inner scales ligul. colored
11510 Stem simple pubesc. Lvs. lin. pilose ciliated, Involucre racemose lax, Scales lin. obl. bluntish [mucronate
11511 Slender all over hairy, Lvs. grassy, Spike few-fl. Inv. subsess. cylindr. few-fl. Scales round. at end abruptly
11512 Stem simple smooth, Leaves lanc. smooth : upper lin. lanc. very small, Involucre spiked subsquarrose
11513 Stem simple hirsute, Lvs. straight narrow-lin. downy, Spike long, Fl. closely cluster. Inv. appress. squarrose
11514 Stem simple tall, Lvs. lin. smooth ciliated at base nerved and dotted, Spike very long, Fl. sessile [at end
11515 Quite smooth, Stem simple, Rad. leaves obl. : cauline amplexicaul. Panicle corymbose lax spreading
11516 Dwarf, Leaves linear, Stem simple, Flowers spiked

11517 Stem climbing, Leaves ovate entire, Flowers spiked
11518 Stem climbing, Leaves subcordate hastate toothed, Flowers in spikes
11519 Stem climbing smooth, Lvs. cord. repand toothed acuminate with spreading unequal lobes, Fl. corymbose

11520 Flowers sessile lateral
11521 Flowers axillary sessile, Corollas all trifid

11522 Leaves lanc. veiny obsoletely serrate smooth, Invol. 4-fl. Stem shrubby
11523 Stem panicled, Leaves smooth : lower pinnated, upper fascicled, all filiform
11524 Leaves opp. subverticill. linear entire pubescent 3-nerved dotted : radical somewhat toothed
11525 Leaves sessile amplexicaul. distinct ovate-lanc. rounded at base serrated smooth, Stem smoothish
11526 Leaves sessile distinct ovate scabrous : upper coarsely serrated at base ; uppermost entire
11527 Leaves sessile distinct roundish cordate bluntly serrate veiny
11528 Leaves subsessile lanceolate 3-nerved narrowed at each end downy : lower serrated in middle
11529 Leaves stalked 3 or 4-nate ovate narrowed at each end serrated roughish
11530 Leaves opposite subpetiolate tri-quinque-partite : their segments lanceol. deeply serrate
11531 Leaves petiolate ternate and simple downy beneath unequally serrate, Stem smooth
11532 Leaves stalked 4 or 5-nate ovate lanceolate serrate rugose veiny roughish, Stem hollow
11533 Leaves stalked 4 or 5-nate ovate lanceolate unequally serrate downy beneath, Stem solid furrowed
11534 Leaves stalked 4 or 5-nate ovate acuminate serrated scabrous on each side, Stem solid round
11535 Leaves stalked 3 or 4-nate ovate-lanceol. cuneate at base unequally serrate smoothish, Stem solid smooth
11536 Leaves connate perfoliate downy
11537 Leaves stalked cordate ovate bluntish 3-nerved bluntly serrate, Fl. corymbose
11538 Hispid, Leaves stalked cordate cut serrate, Panic. terminal, Invol. many-fl. subulate pungent
11539 Leaves stalked ovate acute 3-nerved bluntly serrate glabrous, Stem panicled upwards, Fl. corymbose
11540 Leaves stalked ovate acuminate 3-nerved unequally coarsely serrated smooth, Corymb many-fl. spreading
11541 Leaves stalked triangular ovate serrated entire at end downy beneath, Corymbs spreading term. sessile
11542 Leaves narrow lanceol. 3-nerved subserrated, Invol. squarrose many-flowered
11543 Leaves amplexicaul. lanc. acuminate rugose serrated, Flowers panicled clustered
11544 Leaves stalked ovate acuminate unequally and bluntly crenated pubescent, Panicle contracted
11545 Leaves stalked ovate acuminate toothed 3-nerved glabrous
11546 Stem twining villous, Lvs. deltoid ovate acute 3-nerved soft beneath, Panicle term. trichotomous diffuse
11547 Like E. lamiifolium, but the flowers smaller and panicled

and Miscellaneous Particulars.

1683. *Mikania.* Named by Willdenow, after Professor Mikan, of Prague. Climbing tropical plants, one of which, M. Guaca, is employed in South American medicine as a powerful febrifuge.

1684. *Sparganophorus.* From σπαργανον, a fillet, and φερω, to bear, because the seed is crowned with a membranous band or border.

1685. *Eupatorium.* This plant, says Pliny, derives its name from Eupator King of Pontus, who first used it in medicine. *Aya-pana* is the vernacular name of the species so called among the natives of the banks of the river Amazon. The tribe of Eupatoriæ is distinguished from Vernoniæ by its style. They are chiefly found in America, very few inhabit Asia, scarcely any Africa, and not one has been found in Europe.

The Eupatorium perfoliatum has some reputation as a medicinal plant. A dissertation upon the subject of its merits was published a few years since by an American physician, from which it appears that the virtues of the plant reside chiefly in the leaves, and that the most efficient mode of exhibiting it is by means of a simple decoction. The medical powers of Eupatorium are, as its sensible properties would seem to indicate, those of a tonic stimulant. Given in moderate quantities, either in substance, or in cold infusion or decoction, it promotes digestion, strengthens the viscera, and restores tone to the system. Like other vegetable bitters,

History, Use, Propagation, Culture,

if given in large quantities, especially in warm infusion or decoction, it proves emetic, sudorific, and aperient. Even in cold infusion, it tends to bring on diaphoresis. The plant is also stated to be an excellent remedy for the cure of intermittent fevers. When employed as a tonic, this plant may be taken in doses of twenty or thirty grains, or a teacup full may be used of the infusion rendered moderately bitter. When intended to act as an emetic, a strong decoction may be made from an ounce of the plant in a quart of water boiled to a pint. (*Rigelow.*)

1686. *Dumerilia.* Named after M. A. M. Constant Duméril, author of an Elementary Treatise upon Natural History, published in one volume octavo, at Paris, in 1804. Small half-shrubby South American plants, with firm hairy leaves.

1687. *Ageratum.* A name employed by Dioscorides, and probably applied by him to some plants similar to what we call properly "everlastings;" it is derived from α, privative, and γηρας, old age, because it never grows old; that is to say, always preserves its color.

1688. *Cælestina.* From *cælestis*, blue, in allusion to the color of the flowers.

1689. *Stevia.* Dedicated by Cavanilles to the memory of Peter James Esteve, a Spanish physician of the sixteenth century. He left behind him a dictionary of the plants natives of the kingdom of Valentia.

1690. *Cephalophora.* From κεφαλη, a head, and φερω, to bear, its flowers being united in little heads.

1691. *Apherephis.* From ἀμφηρεφὴς, which signifies well covered, on account of the double involucrum of the genus.

11548 Lvs. sessile distinct ovate scabrous veiny: lower doubly serrate; upper subserrate, Stem panicled downy
11549 Leaves stalked cordate acute subserrate villous beneath, Invol. 8-15-fl. Stem shrubby
11550 Leaves stalked hastate triangular 3-nerved unequally serrate downy beneath, Panic. corymbose
11551 Stem twining, Leaves reniform ovate acuminate serrate-toothed, Panicle axillary

11552 Leaves roundish 7-lobed: lobes crenate, Panicle corymbose terminal

11553 Leaves ovate subcordate, Stem hairy, Paleæ of pappus awned toothletted
11554 Leaves ovate cuneate at base, Stem pilose, Paleæ of pappus lanceolate acute
11555 Stem erect simple scabrous, Leaves cordate rugose unequally serrated
11556 Hispid, Leaves cordate ovate crenate rugose, Corymb compound, Paleæ of pappus lanceolate awned

11557 Leaves stalked ovate acute rounded at base serrated pilose above hairy beneath

11558 Leaves lanc. channelled narrowed into the footstalk 3-nerved, Corymb fastigiate
11559 Leaves lanc. 3-nerved entire. Corymb fastigiate, Pappus paleaceous and awned
11560 Leaves oblong ovate entire, Corymbs spreading, Pappus awned as long as corolla
11561 Leaves lanc. narrowed at each end serrated in the middle, Corymb spreading, Pappus with 2 awns
11562 Leaves lin. lanc. serrated at end, Corymbs fastigiate, Pappus paleaceous and awned
11563 Leaves lanc. narrowed into the footstalk 3-nerved finely serrated at end, Corymbs fastigiate
11564 Leaves ovate 3-nerved serrated cuneate and entire at the base, Pappus chaffy and awned
11565 Leaves stalked digitate pedate entire, Pappus paleaceous. (*Florestina*, Cass.)
11566 Leaves sessile narrowed at base rough with minute hairs, Pappus with 3 awns
11567 Leaves 10 lines long 4 lines broad finely downy beneath, Flowers purple

11568 The only species

11569 Leaves of invol. foliaceous: inner ovate obl. rounded; outer awned

11570 Hoary, Leaves sub-bipinnatifid, Flowers in compound corymbs

11571 Leaves 3-nerved ovate acuminate scabrous unequally toothed

11572 Flowers solitary stalked winged, Leaves oblong triple-nerved unequally serrated scabrous

11573 Leaves long-lanc. Leaves of invol. blunt, Paleæ spatulate
11574 Leaves lanc. oval acuminate 3-nerved, Paleæ narrow linear

11575 Leaves lanceolate serrate, Stem erect
11576 Leaves ovate repand: lower alternate, Stem branched ascending, Invol. many-leaved
11577 Leaves ovate subcordate serrated, Stem branched diffuse

11578 Leaves opp. ovate-acumin. serrate, Pedunc. panicled, Heads ovate
11579 Leaves opp. ovate-lanceolate entire downy, Pedunc. opp. diverging many-flowered

and Miscellaneous Particulars.

1692. *Hymenopappus.* From ὑμην, a membrane, and παππος, pappus, in allusion to the membranous pappus of its seeds.

1693. *Melananthera.* From μελας, black, and *anthera.* A plant with black anthers, a very unusual character in this tribe of plants, the anthers of which are usually either white or yellow, according to the color of the corolla.

1694. *Marshallia.* Named after Henry Marshall, an Englishman, author of a sort of history of the trees and shrubs of North America, published in 1778.

1695. *Spilanthes.* From σπιλος, a spot, and ανθος, a flower, in allusion to the heads of flowers of the original species, which are yellow with a brown disk. Jacquin says he so called it, because the flowers are spotted with black points. S. salivaria is used by the natives of South America to relieve the tooth-ache by the salivation which it produces copiously. The flower-heads of S. oleracea are an excellent ingredient in salads, on account of their agreeable and lasting piquancy.

The leaves of Spilanthes tinctoria of Loureiro, which is said to be very similar to the Abcedaria figured by Rumphius, vol. ii. t. 65., give out when bruised a beautiful blue color, quite equal to indigo.

1696. *Salmea.* This name was originally given by Cavanilles to a genus related to Aloe, and was named after Prince Charles of Salm-Salm, a great promoter of botanical science. It was transferred to the genus which now bears the name by Professor Decandolle, in the appendix to his Hortus Monspeliensis.

History, Use, Propagation, Culture,

1697. *Bidens.* So called because its seeds are surmounted with two teeth. Very worthless inconspicuous weeds.

1698. *Platypteris.* So called from πλατυς, broad, and πτερον, a wing, in allusion to the margin of the seeds. A small stove herbaceous plant of little merit.

1699. *Lagasca.* Named in honor of Don Mariano La Gasca, professor of botany at Madrid, an amiable man and excellent botanist. He is, at the time of writing this, residing in England, whither he has fled from the dangers of persecution in his own country.

1700. *Lavenia.* A name of unknown meaning, originating with Sherard. Small useless annuals, natives of the East and West Indies.

1701. *Cacalia.* A name applied by Dioscorides to a mountain plant with large whitish leaves. By some it is believed to have been what is now called Cacalia alpina. To Sprengel it appears to be the Bupleurum

11580 Flowers discoid stalked, Outer invol. 3 times as long as flower, Lvs. ovate with 1 or 2 teeth on each side
11581 Leaves tripartite, Leaflets lanceolate deeply serrated, Bristles of the pericarp 2-3
11582 Fls. droop. Bracteas lanc. ent. (longer than inv.) Lvs. lanc. serrat. undivid. Bristles of pericarp about 4 erect
11583 Flower radiant erect, Outer invol. longer than inner, Cauline leaves lanc. serrated: radical subternate
11584 Fls. discoid, Outer invol. 6 times as long as flower, Leaflets ciliated at base, Lower lvs. pinn.: upper ternate
11585 Fls. radiant, Outer inv. the length of inner, Lower leaves pinnate: upper ternate, Leaflets ovate serrated
11586 Fls. radiant, Outer inv. length of inner, Low. lvs. pinn.: upper tern. Leafl. ov. subcord. serr. uneq. at base
11587 Fls. discoid, Outer inv. length of inner, Low. lvs. pinn.: upper tern. Term. leafl. twice as large as the rest
11588 Flowers radiant, Outer invol. longer than inner, Leaves decussively pinnated serrated
11589 Flowers subradiant, Outer invol. length of inner, Leaves bipinnate: leaflets lanc. pinnatifid
11590 Fls. discoid, Outer inv. longer than flower, Lvs. scabr. toothed: low. roundish ov.: upp. tern. Stem hairy
11591 Leaves bi-tripinnate: pinnæ linear acute channelled entire, Outer leaves of invol. blunt downy
11592 Flowers radiant erect, Outer involucre longer than inner, Leaves lanc. stalked equally serrate
11593 Leaves lanc. acute serrated subciliated, Outer involucre leafy
11594 Flowers discoid, Outer invol. 3 times as long as flower, Cauline leaves ternate: lateral connate
11595 Flowers discoid, Outer invol. longer than inner, Leaves ternate: leaflets 3-parted cut-toothed
11596 Flowers radiant, Outer invol. length of inner, Leaves bipinnate, Leaflets cuneiform 3-toothed
11597 Leaves lyrate-pinnated: pinnæ ovate acute serrated pubescent, Flowers panicled

11598 Leaves hoary toothed, Stem with 4 wings

11599 Leaves stalked ovate acuminate subcrenate softly silky
11600 Leaves on short stalks elliptical blunt obsoletely toothed rigid

11601 Stem branched erect, Leaves elliptical finely serrated

11602 Stem shrubby with cylindr. truncate papillæ, Leaves lanc. flat
11603 Stem shrubby, Leaves ovate-oblong flat, Petioles with a triple line at base
11604 Stem shrubby, Leaves lanc. flat, Flowers corymbose
11605 Stem shrubby, Leaves compressed fleshy
11606 Stem shrubby, Leaves roundish fleshy incurved, Pedunc. terminal 1-fl. naked
11607 Stem shrubby, Leaves depressed fleshy
11608 Stem shrubby, Leaves depressed fleshy woolly

11609 Stem shrubby, Leaves fleshy flat ternate, Leaflets 3-lobed
11610 Stem suffruticose, Leaves ovate-lanc. toothed downy beneath
11611 Shrubby downy, Leaves cordate ovate acute angular downy beneath: stalks with leafy appendages
11612 Stem herbac. branched, Lvs. lanc. smooth toothed: of the stem amplexicaul.; of the branches stalked
11613 Leaves thickish villous: lower oval repand-toothed stalked; upper sublyrate amplexicaul.
11614 Stem herbaceous, Leaves amplexicaul. toothed: lower lyrate; upper sagittate toothed
11615 Leaves obl. lanceolate connate downy beneath, Racemes axillary
11616 Radical leaves ovate spatulate: cauline entire amplexicaul. crenate edged
11617 Stem herbaceous, Leaves sessile obl. lanc. serrated: at the base cuneate entire decurrent
11618 Stem herbaceous, Leaves stalked 3-lobed hastate serrate, Flowers racemose nodding
11619 Stem herbaceous, Lvs. stalked rhomboid hastate unequally toothed, Flowers corymbose spreading erect
11620 Stem herbaceous, Leaves stalked hastate-sagittate serrated, Flowers corymbose erect
11621 Stem herbaceous, Leaves stalked: radical cordate toothed; cauline rhomboid with 2 teeth on each side
11622 Stem herbaceous, Leaves stalked: radical cordate reniform repand toothed; cauline oblong toothed
11623 Stem herbaceous, Leaves stalked cordate toothed, Petioles naked, Corymbs fastigiate, Invol. 5-flowered
11624 Stem herbac. Leaves stalked cordate toothed hoary beneath, Petioles auricled at base, Corymbs fastigiate
11625 Stem twining, Leaves triangular sinuate-toothed
11626 Stem herb. Rad. lvs. bipinnatifid: caul. pinn. Pinnæ toothed: upper confluent, Corymb comp. fastigiate
11627 Stem herbaceous, Leaves toothletted: lower stalked obovate; upper obl. lanc. sagittate amplexicaul.

and Miscellaneous Particulars.

longifolium of the moderns. The species are nearly all objects of ornament. Some of them are remarkable for their fleshy awkward looking stems, others for their discolored leaves. The succulent kinds require to be grown in old rubbish, and to be treated as directed for Mesembryanthemums. The leaves of some species (C. procumbens and sonchifolia) are used as salad by the Chinese; and those of C. Ficoides are sometimes pickled by the French.

C. Kleinia is called cabbage tree, from the resemblance which the stalks have to those of the cabbage; and carnation tree, from the shape of the leaves and color of the flowers.

Upon Cacalia alpina, &c., M. Cassini has founded his genus Adenostyles and tribe of Adenostyleæ; distinguished from Senecioneæ, to which Cacalia belongs, by the roughness of all the back of the two lobes of the style. But we do not find the division adopted by other botanists. M. Cassini himself suspects that Adenostyleæ may be united with Tussilagineæ.

History, Use, Propagation, Culture,

1702. *Kleinia.* Named after James Henry Klein, a German botanist, who published, in 1719, a dissertation upon the Juniper.

1703. *Ethulia.* A word formed by Linnæus without any explanation of its meaning. It is not easy to understand wherefore Vaillant's more ancient name of Sparganophorus should not have been adopted.

1704. *Piqueria.* So named by Cavanilles, in honor of Andreas Piquerio, a Spanish botanist, who published a translation of Hippocrates, in 1757.

1705. *Chrysocoma.* From χρυσος, gold, and κομη, hair, in allusion to the tufts of yellow flowers with which the stems are terminated. The specific name Comaurea is a mere translation of the generic appellation. Linosyris, the name of another species, is so called from *linum*, flax, and *osyris*, an ancient name for a plant with long flexible branches and flax-like leaves, which is the character of C. linosyris; which, when handled, sends forth a very fine aromatic smell.

1706. *Tarchonanthus. Tarchon* is a name given by the Arabian physicians to the Artemisia Dracunculus, and is the root of our English word *Tarragon.* Ανθος signifies flower, and the word thus compounded may be Englished Tarragon-flower.

1707. *Calea.* Derived from καλες, beautiful. The species are ornamental shrubs of South America, with undivided leaves, and corymbose, terminal, or axillary heads of yellowish purple flowers. Mr. Brown's history

11628 Leaves obl. lanc. acute at each end nearly entire
11629 Leaves elliptical blunt mucronate repand with pellucid dots
11630 Leaves linear entire with pellucid dots, Stem suffruticose

11631 Flowers panicled
11632 Leaves linear toothed decurrent, Pedunc. opposite the leaves 1-fl. Stem divaricating
11633 Stem winged, Leaves lanc. acute serrated downy decurrent, Flowers corymbose

11634 Leaves opp. ovate-lanc. serrated 3-nerved, Invol. with 4 flowers

11635 Leaves linear straight smooth decurrent at back
11636 Leaves linear recurved roughish, Flowers cernuous
11637 Leaves linear straight ciliated, Branches pubescent
11638 Leaves lanc. ovate recurved toothletted serrated, Peduncles pubescent
11639 Leaves oblong tapered at base toothletted wavy
11640 Leaves linear glabrous, Involucres lax
11641 Leaves linear-lanceolate 3-nerved scabrous, Flowers corymbose, Invol. lax
11642 Panicled, Leaves lanc. 3-nerved dotted naked
11643 Leaves lanc. villous, Involucres contracted

11644 Leaves oblong entire downy beneath

11645 Flowers about 3 stalked, Leaves ovate-oblong subserrate stalked

11646 Corymbs heaped, Peduncles very long, Leaves lanc. Stem herbaceous

11647 Leaves opp. undivided, Panicle terminal brachiate

11648 Corymbs heaped, Leaves alternate: upper ovate-lanceolate; lower toothed hastate sinuate serrate

11649 Panicles very large erect diffuse capillary

11650 Leaves lanc. narrowed at base serrated alternate

11651 The only species

11652 Pedunc. 1-fl. Leaves hoary toothed in 4 rows, Teeth blunt, Branches dowy, Invol. pubescent
11653 Pedunc. 1-fl. Leaves hoary toothed in 4 rows, Teeth subulate much spreading, Branches downy
11654 Pedunc. 1-fl. Leaves smooth toothed in 4 rows, Teeth subulate straight, Branches and invol. smooth
11655 Pedunc. 1-fl. Leaves linear warted at edge: upper entire
11656 Pedunc. 1-fl. Leaves bipinnate, Stems simple
11657 Pedunc. 1-fl. Leaves bipinnate, Stems much branched villous
11658 Like Santolina alpina, but segments of leaves are shorter and thicker

and Miscellaneous Particulars.

of this genus, in the twelfth volume of the Transactions of the Linnean Society, is a model of botanical erudition and acuteness, such as has been rarely seen in modern days.

1708. *Isocarpha.* From ισος, equal, and καρφη, chaff, in allusion to the equality of the chaff of the receptacle and the leaves of the involucrum. Herbs of South America, with opposite undivided leaves, and ovate terminal heads of whitish flowers.

1709. *Petrobium.* From πετρος, a stone, with reference, it is presumed, to the texture of the grains. A small tree, native of St. Helena, where it is called *white wood.*

1710. *Neurolæna.* From νεῦρον, a nerve, and λαῖνος, stony. An erect shrub of South America, with alternate, undivided, and lobed leaves, and terminal compound corymbs of yellow flowers.

1711. *Humea.* Named in honor of Sir Abraham Hume, Bart. of Wormleybury, in Hertfordshire, a gentleman whose whole life has been devoted to the protection and assistance of the arts and sciences, and especially of botany. A beautiful plant with immense capillary panicles of brilliant crimson flowers.

1712. *Cæsulia.* Meaning unknown. Little creeping weed-like plants, rooting at the joints.

1713. *Ixodia.* From ιξωδης, viscid. A greenhouse shrub, native of the south coast of New Holland; flowering most part of the year.

1714. *Santolina.* Supposed to be a diminutive of *sancta;* a holy little herb; in allusion to some reputed virtues. A genus of slightly shrubby somewhat aromatic plants, with yellow discoid flowers.

11669 11672 11675 11676 11665

History, Use, Propagation, Culture,

1715. *Otanthus.* From ωτος, an ear, and ανθος, a flower, in allusion to the appendages which are placed on each side of the base of the florets. An infusion of the leaves and stem is said to be employed successfully in the east in cases of stone and gravel.

1716. *Caleacte.* So called because it is the ornament of the sea coasts where it grows, and derived from καλος, beautiful, and ακτη, the sea shore.

1717. *Athanasia.* From α, privative, and θανατος, death; that is to say, a plant which does not perish. But the application of the word, as far as the present genus is concerned, is far from obvious.

1718. *Balsamita.* Derived from βαλσαμον, balm, in allusion to its strong balsamic smell. Ugly plants of no merit whatever. B. vulgaris has the English name *Costmary*, from the Greek Κοστος, an aromatic shrub, and Mary; the Virgin Mary's costus: from its being put into ale, it has our old English name of *Ale-cost*. It is more aromatic and has a pleasanter smell than tansy, to which it is nearly allied.

1719. *Pentzia.* Named by Thunberg, after his pupil Charles John Pentz. A bushy branching hoary shrub, with little yellow flowers.

11659 Pedunc. corymbose, Leaves oblong blunt crenated densely woolly

11660 The only species

11661 Leaves ovate villous, Heads terminal subsessile
11662 Leaves obov. lanc. blunt villous, Umbels terminal, Branches villous
11663 Corymbs simple contracted, Leaves pinnatifid toothed
11664 Corymbs compound, Leaves recurved: lower linear toothed; upper ovate serrate
11665 Leaves cuneiform cut-trifid, Flowers in umbels
11666 Leaves cuneiform: lower pinnatifid cut: upper 3 or 5-toothed, Flowers in umbels
11667 Leaves linear tomentose, Panicle compound
11668 Leaves linear filiform smooth, Flowers panicled
11669 Leaves trifid with linear smooth segments, Flowers somewhat in umbels
11670 Leaves pinnated: pinnæ linear smooth, Panicle decompound
11671 Leaves pinnated: pinnæ linear smooth, Panicle compound

11672 Stem herbaceous branched at base, Branches 1-fl. Leaves sessile lanc. serrated
11673 Leaves obovate serrated sessile clustered, Flowers subcorymbose
11674 Leaves ellipt. toothed: lower stalked; upper sessile auricled at base, Flowers corymbose
11675 Radical leaves bipinnate: cauline many pinnated downy; pinnæ linear acute mucronate

11676 Corymbs simple, Leaves deltoid serrated at end

SUPERFLUA.

11677 Leaves lanceolate channelled, Raceme terminal fastigiate
11678 Leaves pinnated: pinnæ linear toothed pubescent, Corymb fastigiate leafy at base
11679 Leaves pinnated silky with down, Pinnæ lanc. somewhat toothed at end, Corymb terminal
11680 Leaves bipinnatifid inciso-serrate

11681 Leaves pinnatifid: segm. lanceolate serrated, Corymb contracted, Invol. angular

11682 Leaves obovate blunt lobed small, Flowers panicled stalked
11683 Leaves hoary: lower pinnated with palmate pinnæ; upper palmate sessile, Heads panicled simple
11684 Cauline leaves pinnated smoothish: floral undivided linear, Panicle virgate, Heads glob. stalked nodding
11685 Stem upright, Lower leaves bipinnate: upper pinnated capillary, Invol. downy hemispherical
11686 Caul. lvs. pinnat. very smooth: floral undivided setaceous, Involucres downy, Heads glob. stalk. nodding
11687 Stem upright, Leaves bipinnate capillary: floral simple, Invol. oblong
11688 Leaves tripinnatifid silky cinereous, Leaflets linear, Heads globose, Flowers branched simple
11689 Leaves bipinnatifid silky white, Leaflets lanc. linear, Heads globose, Flowers branched virgate
11690 Stem quite simple, Leaves all palmate multifid white, Heads terminal clustered
11691 Stem quite simple, Leaves all palmate multifid white, Lower heads stalked: upper sessile
11692 Stem branched spreading, Leaves all bipinnate capillary, Invol. smooth hemispherical
11693 Stem quite simple, Leaves all palmate multifid silky acute
11694 Leaves hoary: lower cuneiform obtuse 3-lobed; upper linear blunt, Flowers globose stalked cernuous
11695 Stem quite simple, Leaves hoary: radical palmate multifid; caul. pinnatifid; upper linear entire blunt
11696 Stem quite simple, Leaves pectinate pinnatifid glabrous, Pinnæ linear filiform, Pedunc. 1-fl. axillary
11697 Stem quite simple, Lvs. bipinnatifid subpub. beneath: segm. lin. lanc. acum. entire, Raceme naked term.
11698 Cauline leaves pinnated linear smooth, Branches undivided, Spikes 1-sided reflexed
11699 Cauline leaves pinnated setaceous smooth: radic. pinnated multifid silky, Stem erect, Branches divided

and Miscellaneous Particulars.

1720. *Tanacetum.* An alteration of Athanasia, which see. *Tanaisie*, Fr., *Tansy*, Eng., *Reinfahren*, Ger. The common Tansy has a strong aromatic smell, and an extremely bitter taste. It is stimulant and carminative; and its seeds are reckoned anthelmintic and sudorific. It is said to drive bugs away from a bed in which it is laid. A distilled water and a kind of stomachic bitter are prepared from it. The young leaves are shredded down and employed to give color and flavor to puddings; they are also used in omelets and cakes, and those of the curled variety for garnishing.

1721. *Artemisia.* Artemis was one of the names of Diana, the goddess of chastity. The plant is said to have been named after this goddess, on account of the purposes to which it was applied in bringing on precocious puberty. Pliny, however, informs us, that in his time, there was an opinion that the plant was named after Artemisia, the Queen of Mausolus, King of Caria.

A. Abrotanum, Santonica, maritima, and Absinthium, are included in the Materia Medica, but, according to Dr. Thomson, the latter species is the only one deserving to be retained. It is tonic, antispasmodic, and anthelmintic; and when externally applied, is discutient and antiseptic. It has been used with advantage in inter-

History, Use, Propagation, Culture,

mittents, gout, scurvy, and dropsy; and although modern practitioners will scarcely rely on its efficacy in these complaints, yet it is undoubtedly of some value as a stomachic. (*London Dispen.* p. 182.) The seed of wormwood is used by the rectifiers of British spirits, and the species is a good deal cultivated on dry soil near Mitcham, in Surrey, for that purpose. A. vulgaris is used in some parts of Sweden instead of hops, in order to increase the inebriating quality of malt liquor. The plant is readily eaten by cattle and sheep, and is found in our best natural pastures on dry soils. It is said to be stomachic and slightly stimulating.

The species called Abrotanum, *Garde-robe*, Fr., derives its name from α, privative, and βροτος, mortal; on account of the great virtues attributed to it as a preservative of life; Absinthium, from α, privative, and ψιν θος, pleasure, i. e. unpleasant.

Dracunculus, *Tarragon*, Eng., *Estragon*, Fr., *Dragon*, Ger., and *Dragoncelia*, Ital., is said to have been so called on account of its tortuous roots, which may be likened to the sinuous tail of a dragon; but it is much

11700 Caul. lvs. pinnated setac. smooth : radic. pinnated with 3-fid hoary segm. Stem procumb. branched virgate
11701 Leaves bipinnatifid downy beneath : segm. lanceolate blunt, Panic. 1-sided, Heads nodding
11702 Cauline leaves pinnated or trifid filiform pubescent, Stem ascending somewhat divided
11703 Cauline leaves pinnated smooth : pinnæ filiform remote very long, Heads globose erect sessile
11704 Cauline lvs. pinnated smooth : lower and radic. 3-partite multifid, Stem panic. erect, Peduncles nodding
11705 Cauline lvs. pinnated smooth somewhat fleshy : pinnæ simple or bifid lin. blunt, Heads obl. stalked erect
11706 Cauline lvs. hoary pinnated linear filiform : floral undivided filiform, Heads roundish angular nodding
11707 Leaves glaucous downy : lower pinnated, Pinnæ linear-lanceolate, Heads globose stalked nodding
11708 Leaves multipartite hoary, Racemes erect 1-sided, Heads erect about 5-fl. Only one female floret or none
11709 Leaves pilose triply-pinnatifid, Stem simple with a leafless panicle, Heads globose nodding
11710 Leaves simply pinnate with some of the segments bifid subpalmate, Heads erect
11711 Leaves hoary-silky : lower pinnated, Stem nearly erect much branched, Heads sessile ovate
11712 Leaves downy pinnated : the uppermost undivided, Racemes drooping, Recept. naked, Flow. obl. sessile
11713 Leaves downy pinnate : the uppermost undivided, Racemes drooping, Recept. naked, Flowers obl. sessile
11714 Leaves hoary : radical bipinnate, Pinnæ close linear blunt : of the branches pinnated sessile
11715 Leaves pinnated white with down, Fascicles of flowers bracteate, Heads downy
11716 Leaves hoary : lower pinnated ; pinnæ linear 3-parted, Heads stalked roundish nodding
11717 Leaves snow-white : cauline bipinnate linear filiform ; floral simple, Heads obl. sessile erect
11718 Leaves hoary : radical pinnated ; pinnæ 3-parted linear-filiform, Heads obl. stalked nodding
11719 Leaves subpubescent : cauline pinnated ; pinnæ linear acute, Heads globose stalked nodding
11720 Leaves silky : cauline pinnate ; pinnæ 3-parted linear runcinate, Heads globose nodding
11721 Leaves silky white, Pinnæ 3-parted linear acute, Heads roundish stalked cernuous
11722 Cauline leaves pinnated or trifid linear, Stem erect panicled, Branchlets nodding 1-sided
11723 Cauline lvs. hoary pinnated linear-filiform, Stem ascending branched panicled, Involucre roundish angular
11724 Leaves downy beneath : cauline bipinnate, Leaflets linear, Heads roundish stalked nodding
11725 Leaves smooth : lower tripinnate ; upper bipinnate, Leaflets linear acute, Heads globose stalked nodding
11726 Leaves smooth triply pinnatifid, Stem straight, Heads roundish subsessile erect
11727 Cauline leaves pinnated hoary white : pinnæ trifid linear, Stem erect, Involucre hoary, Heads globose
11728 Leaves hoary : lower bipinnate, Pinnæ linear-filiform, Heads oblong sessile
11729 Leaves smooth : radic. triply pinnate ; upper undivided linear, Heads roundish subsessile erect
11730 Lvs. bi-tripinnatif. clothed with short silky down, Segments lanc. Heads hemispheric. droop. Recept. hairy
11731 Lvs. somewhat hoary : caul. bipinnatifid ; floral trifid or lanc. Heads globose stalked nodding, Inv. scarious
11732 Lvs. downy : lower decompound ; upper simple, Panicle corymbose, Heads fascicled ovate hoary
11733 Leaves pinnatifid : their segm. cut downy beneath, Heads somewhat racemed ovate, Recept. naked
11734 Leaves downy beneath : caul. pinnatifid ; floral undivided linear, Heads sessile obl. erect, Involucre smooth
11735 Leaves lanc. acuminate downy beneath somewhat toothed, Heads ovate subsessile erect
11736 Leaves smooth lanc. acute : cauline trifid at end, Heads roundish stalked nodding
11737 Leaves hoary lanceolate entire : radical cut ; floral oblong stalked nodding
11738 Lvs. smooth lanc. narrowed at each end, Heads roundish stalked erect, Scales of involucre membr. at edge
11739 Leaves smooth lanceolate narrowed at each end, Heads roundish stalked erect

11740 Leaves downy beneath scabrous above : radical stalked oblong ; cauline amplexicaul. wavy
11741 Leaves sessile linear smooth above revolute at edge, Heads capitate, Pedunc. long
11742 Leaves amplexicaul. ovate oblong 3-nerved woolly above, Corymb. stalked, Involucre cylindrical
11743 Leaves amplexicaul. panduriform spatulate blunt downy, Corymb and branches divaricating
11744 Branches downy, Lvs. linear revolute at edge smooth above downy beneath, Leaves of involucre lanc. acute
11745 Branches pubesc. Lvs. lanc. lin. acumin. smooth above finely downy beneath, Heads corymb. cylindrical
11746 Tomentose, Leaves linear acute curved, Heads in capitate stalked corymbs
11747 Leaves lanc. sessile 3-nerved naked above woolly beneath, Corymb contracted-capitate
11748 Leaves amplexicaul. spatulate downy acute, Corymb. term. Branches spreading
11749 Leaves sessile lanc. Involucres white : lower scales brown
11750 Leaves lin.-lanc. mucronate revolute at edge downy beneath, Heads sessile capitate terminal
11751 Leaves lanc. mucronate revolute at edge downy beneath, Heads corymbose
11752 Leaves obl. blunt downy, Corymbs fastigiate, Heads cylindrical
11753 Leaves lin. spreading recurved scabrous above, Corymb. dense, Involucre cinereous at base
11754 Leaves sessile linear, Outer involucre rough : inner flesh-colored
11755 Leaves clustered roundish, Corymbs branched, Involucres downy outside
11756 Leaves linear, Corymb compound, Branches virgate

and Miscellaneous Particulars.

more probable that the word is a corruption of *Tarchon*, the Arabic name of the plant. See Tarchonanthus. The leaves and points of the shoots are used as an ingredient in pickles. A simple infusion of the plant in vinegar makes a pleasant fish sauce ; it is eaten along with beef steaks, as horse-radish is with roast beef ; and is employed, both in Europe and Persia, to correct the coldness of salad herbs, and season soups and other compositions. The plant is of the easiest culture, but, like other species of the genus, dislikes a wet soil.

From the acrid leaves of A. chinensis the drug called Moxa is obtained ; a substance much in use among the Chinese as an actual cautery. For this purpose, the Moxa is laid upon the part affected and set on fire. The Cochin-Chinese, and also the Japanese, according to Kæmpfer, use Artemisia vulgaris for the same purpose, and it is said with great success, in removing tumours and rheumatic pains, or slight convulsions.

1722. *Gnaphalium.* A word under which Dioscorides describes a plant with soft white leaves, which served the purpose of cotton. It agrees pretty well with the modern genus, which consists of very pretty, sometimes

History, Use, Propagation, Culture,

beautiful woolly leaved shrubs or herbs, all of the description called Everlasting, on account of the permanence of the colors and form of their dry flowers.

1723. *Leontopodium.* From λεων, a lion, and πους, a foot. The soft tufted silky heads have been compared to the foot of such an animal as a lion.

1724. *Evax.* A name, the meaning of which has not been explained. A little white annual weed.

1725. *Antennaria.* In allusion to the awns of the pappus, which resemble the *antennæ* of some insec' genus founded upon the Gnaphalium margaritaceum of Linnæus. It consists of herbaceous plants, nati Europe and North America, having the male and female flowers in distinct involucra, and on differen' individuals.

1726. *Metalasia.* Apparently so called from μιτα λασσω, to change or alter: but the application of th name is not evident.

11757 Leaves sublanc. downy sessile, Corymbs altern. round, Heads globose
11758 Leaves broad-lanc. somewhat stalked coriaceous downy, Corymb. compound, Stem proliferous
11759 Much branched, Leaves lanc. acutish sessile, Inner scales of invol. yellow
11760 Leaves lanc. acute 3-nerved at base wavy pilose: beneath tomentose, Corymb contracted bracteate
11761 Leaves lin. lanc. hoary: radical blunt; cauline acute, Corymb compound, Pedunc. long
11762 Leaves lanc. 3-nerved smooth above, Raceme terminal, Stem branched below
11763 Leaves lanc. Corymb decompound, Stem branched below
11764 Leaves hoary downy blunt: radical spatulate lanc.; cauline lin.-lanc. Corymb compound
11765 Leaves linear long narrow downy replicate at edge, Corymb compound umbellate
11766 Leaves half amplexicaul. linear-lanc. subrepand downy on each side: lower blunt, Corymb clustered
11767 White with down, Lvs. lin.-lanc. undivided below, Heads clustered conical
11768 Leaves subspatulate downy naked at end membranous or subulate, Flowers panicled
11769 Leaves decurrent blunt mucronate downy on each side flat
11770 Leaves decurrent lanc. downy flat with a naked point
11771 Leaves white silky-downy linear-lanc. acute, Corymb compound
11772 Leaves amplexicaul. entire acute downy beneath, Stem branched
11773 Leaves subamplexicaul. lanc. Corymbs compound, Scales of invol. plaited
11774 Leaves sessile lingulate very downy, Inner scales of invol. subulate recurved
11775 Leaves lin. spatulate downy beneath, Stem erect simple, Heads sessile terminal and axillary
11776 Leaves lin. lanc. Invol. with white lanceolate rays
11777 Stem herbaceous diffuse, Lower scales of invol. subulate naked, Leaves subamplexicaul.

11778 Head terminal enveloped in woolly bracteæ

11779 Stem branched at base, Bractes obovate

11780 Leaves lin. mucronulate reflexed, Corymbs few-flowered simple or proliferous, Scales of invol. blunt
11781 Stem erect simple, Lvs. ellipt. mucronate amplexicaul. 3-nerved [elongated obtuse colored
11782 Shoots procumb. Stems simp. Corymbs crowded, Rad. lvs. spatulate, Fl. diœcious, Inner scales of invol.
11783 Stem simple, Rad. leaves lanc.: floral terminal aggregate sessile, Inner scales of invol. long
11784 Runners procumb. Rad. lvs. ov. nerved, Corymb contracted, Fl. diœcious, Inner scales of invol. long blunt
11785 Leaves lin. lanc. acuminate alternate, Stem branched upwards, Corymb fastigiate
11786 Leaves decurrent lanc. acute wavy downy beneath, Stem branched
11787 Leaves lin. lanc. acutish: smooth above; pubescent beneath, Corymbs terminal contracted

11788 Leaves small fascicled lin. subulate downy above, Flowers lateral

11789 Leaves sessile ovate close erect downy, Corymb sessile
11790 Leaves amplexicaul. ovate-oblong 3-nerved acute woolly beneath on each side

11791 The only species

11792 Scales of invol. blunt scariose: the inner ones of the ray lanc. blunt spreading
11793 Scales of invol. acute membranous at edge: the inner ones of the ray lanc. acute conniving
11794 Scales of invol. roundish scarious: the inner ones of the ray ovate acuminate erect

11795 Leaves sess. lanc. linear woolly acute: floral with a membrane at end, Branches 1-flowered
11796 Leaves sess. lanc. downy keeled spirally imbricated, Branches 1-flowered
11797 Leaves obl.-lanc. silky imbricated, Branches 1-flowered, Peduncles squarrose
11798 Leaves linear subulate erect imbricated, Peduncle scaly 1-flowered
11799 Leaves sessile lanc. obovate acute 3-nerved woolly, Branches 1-flowered
11800 Leaves lanc. white beneath silky recurved-spreading, Branches 1-fl. Peduncles nearly naked
11801 Leaves amplexicaul. ovate lanc. downy beneath tomentose at edge, Branches 3-flowered

and Miscellaneous Particulars.

1727. *Astelma.* From α, privative, and στέλμα, a crown, in allusion to the construction of the fruit. Beautiful Cape shrubs with everlasting flowers.

1728. *Athrixia.* So called by Mr. Ker, we presume from α, without, and θρίξ, hair, in allusion to the absence of hairs upon the receptacle and the stigmas of the ray. A pretty greenhouse shrub, with narrow lanceolate leaves, and bright crimson solitary heads of flowers.

1729. *Xeranthemum.* From ξηρος, dry, and ανθος, a flower, on account of the dry nature of the leaves of [illegible]vx, which retain their color and form for years. The species are popular annual flowers, of easy culture [illegible] rich soil. They are valued for their properties of retaining their texture and color, when gathered and [illegible]ed, in the manner of Gnaphalium, Elichrysum, and other genera of what are vulgarly called everlastings.

1730. *Elichrysum.* From ήλιος, the sun, and χρυσος, gold, in allusion to the brilliant yellow color of the flowers. [illegible]e species are much admired for the brilliancy of their flowers even in a dried state. E. bracteatum is the [illegible]ldsomest annual species, and should be raised on a hotbed, and afterwards transplanted into a warm situation.

History, Use, Propagation, Culture,

The woody species require a sandy peat soil, and to be struck in sand on a hotbed, but not covered with a bell-glass, as they are very apt to damp.

1731. *Carpesium.* Named from καρπεσιον, a bit of straw; the long dry leaves of the involucrum resemble straws.

1732. *Baccharis.* A name given by the Greeks to an aromatic plant dedicated to Bacchus. The species now

11802 Leaves oblong downy imbricated, Branches 1-headed, Heads nodding
11803 Diffuse proliferous, Leaves roundish ovate smooth convex closely imbricated, Heads sessile
11804 Leaves obl. blunt imbricated, Branches 1-fl. Scales of invol. ovate
11805 Leaves obl. silky recurved
11806 Decumbent, Leaves lanc. silky somewhat recurved, Branchlets 1-flowered, Peduncles squarrose
11807 Leaves acerose lin. keeled smooth appressed, Branches 1-fl. Flowers sessile
11808 Lvs. acerose lin. roundish downy above: lower spreading; upper appressed, Branches 1-fl. Pedunc. scaly

11809 Leaves linear lanc. channelled amplexicaul: adult smooth, Branches woolly
11810 Branches numerous very fine filiform, Leaves very small 3-cornered imbricated appressed
11811 Leaves obl. lanc. narrowed at base silky, Peduncles naked 1-flowered terminal
11812 Leaves wavy woolly reflexed at end, Heads small terminal few
11813 Leaves amplexicaul. oblong revolute at edge woolly, Flowers terminal solitary shining

11814 Leaves linear-lanc. silky, Corymb simple terminal
11815 Leaves lanc. acute at each end roughish, Peduncles 1-flowered long, Invol. bracteate

11816 Heads terminal solitary cernuous
11817 Heads axill. subsolitary

11818 Leaves narr. linear entire, Panicle compound many-flowered, Invol. small
11819 Leaves lanc. longitudinally toothed serrate
11820 Leaves lanc. serrated with one or two teeth forwards
11821 Leaves obovate emarginate crenate forwards
11822 Leaves lanc. serrate at end subdecurrent downy beneath
11823 Leaves obl. sessile toothed: teeth of the base deeper and stipule-like

11824 Leaves lanc. 3-nerved tooth-serrated, Corymbs terminal leafy

11825 Lvs. pubesc. ov.-lanc. serr. the upper ones ent. Stem herbaceous corymb. Scales of the invol. recurved leafy
11826 Leaves sessile broad-lanc. acute serrated, Corymbs terminal fastigiate
11827 Leaves ovate acute at each end toothed stalked pilose, Stem erect branched, Pedunc. many-headed
11828 Leaves stalked ovate lanc. very acute toothletted, Corymbs term. and axillary shorter than leaf
11829 Leaves ellipt. serrated villous beneath, Invol. subglobose, Leaves lanc. subulate, Branches spreading
11830 Leaves oblong lanc. doubly toothed acute downy beneath rugose veined, Petioles toothed
11831 Leaves spatulate oblong amplexicaul. serrated rugose
11832 Leaves sess. lanc. obl.: lower obovate-obl. subserrated at end, Branches corymbose-fastigiate
11833 Leaves ovate stalked entire obtuse downy, Pedunc. 1-fl. solitary term. axillary thickened
11834 Leaves lanc. ovate reflexed serrated downy beneath, Flowers terminal heaped
11835 Leaves ov. stalked crenate blunt downy rugose veiny, Pedunc. 1-fl. solitary terminal and axillary
11836 Leaves sublyrate: cauline entire, Stem downy panicled, Invol. campanulate
11837 Leaves toothed radical smoothish obovate: cauline obl. downy, Scales of invol. subulate
11838 Leaves oval entire hirsute beneath
11839 Leaves obl. spatulate tooth pilose, Heads panicled globose, Leaves of invol. subulate soft
11840 Lvs. lanc. serrated at end scabrous at edge: lower obov. Heads heaped, Lvs. of invol. membranous at edge
11841 Stem hairy, Leaves sessile oval blunt denticulate hairy, Panicle terminal contracted
11842 Leaves lin. lanc. scabrous nearly entire revolute at edge, Stem panicled, Scales of invol. lax
11843 Leaves lin. attenuate at base mucronate, Corymbs stalked contracted terminal
11844 Leaves lin. nearly entire, Peduncles long 3-headed
11845 Leaves lin. somewhat toothed, Peduncles very long 1-headed
11846 Leaves spatulate somewhat toothed and stem downy, Pedunc. long 1-fl.
11847 Leaves linear filiform and stems silky with down, Flowers panicled
11848 Leaves cuneiform lin. blunt crenate toothletted smooth, Stem shrubby, Anthers with two setæ
11849 Leaves ovate stalked hoary beneath serrated, Corymb terminal compound
11850 Leaves broad lanc. blunt serrulate downy scabrous, Heads clustered surrounded by bractes
11851 Stem branched with spreading hairs, Leaves subamplexicaul. blunt coarsely serrated hairy
11852 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bractes reflexed
11853 Leaves ovate subcordate pilose viscid toothed auricled at base, Recept. favose
11854 Leaves decurrent ovate mucronate downy: lower serrated, Flowers corymbose
11855 Leaves decurrent lin. lanc. serrulate downy beneath, Spike long terminal interrupted
11856 Stem white with down, Leaves lanc. serrulate downy beneath, Heads terminal

and Miscellaneous Particulars.

called B. Dioscorides is supposed to have been the Baccharis of the Greeks. An extensive genus of shrubby plants, few of which are deserving of cultivation.

1733. *Molina.* Named after John Ignatius Molina, a Spaniard, who published, in 1782, a Natural History of Chili.

1734. *Conyza.* This plant was believed to have the property, when suspended in a room, of driving away

History, Use, Propagation, Culture,

gnats and fleas. From this imaginary property, its Greek name (from κωνωψ, a gnat), its Latin name, *pulicaria*, its English name, *flea-bane*, and its French name, *Herbe aux puces*, are all derived. Conyza marilandica gives out a strong smell of camphor.

1735. *Madia.* *Madi* is the name of the plant in Chili. Clammy weeds, only seen in botanical gardens.

1736. *Erigeron.* A name synonymous with *senecio*, which is a translation of it. Named from ἦρ, the spring, and γέρων, an old man; because it becomes old in the beginning of the season. The name Senecio having been applied to another genus, the Greek term is preserved for this, which is related to it. E. viscosum is used to drive away fleas and gnats, probably from its strong scent, or, as some suppose, from the clammy juice of the leaves and stalks; hence the old name of Flea-bane, or Flea-wort.

1737. *Tussilago.* From *tussis*, a cough, for curing which the flowers are frequently employed at this day. Farfarus is the name under which the Greeks designated the White Poplar, the leaves of which are like the modern T. Farfara.

T. Farfara is a certain indication of a clayey soil, and, according to Dr. Withering, is the first plant which vegetates in marle or lime stone rubble. The clayey part of the pestilential Maremmes of Tuscany, where scarcely any other plant will grow, is covered with common colts foot. The cotton of the leaves wrapped in a rag,

11857 Leaves ovate-lanc. entire hoary downy beneath, Corymb compound terminal
11858 Leaves decurrent ellipt. crenate downy beneath, Heads capitate

11859 Leaves lanc. sessile viscid, Outer involucres 10-leaved
11860 Leaves amplexicaul. lanc. viscid

11861 Leaves sublinear entire, Branches lateral many-flowered
11862 Nearly stemless, Rad. leaves on long stalks triply 3-parted, cauline linear undivided
11863 Stem panicled, Flowers subsolitary terminal, Leaves linear entire
11864 Stem and flowers panicled hairy, Leaves lanc. ciliated
11865 Lower leaves lanc. laciniate: cauline linear, Heads racemose
11866 Leaves scabrous: lower lanc. toothed in middle; upper linear, Heads corymbose
11867 Stem many-fl. Lvs. lanc. subserrate: cauline half amplexicaul. Florets of ray capillary the length of disk
11868 Radical leaves oval-lanc. acute somewhat toothed, Stem nearly leafless simple long
11869 Stem many-fl. pilose, Leaves obl. somew. toothed amplexicaul. Florets of ray capillary longer than disk
11870 Rad. leaves obovate serrated: cauline lanc. entire, Stem about 2-fl. Ray longer than disk
11871 Rad. leaves roundish ovate deeply toothed stalked: cauline lanc. toothed subserrated in middle
11872 Stem few-fl. subvillous, Leaves cuneiform lanc. Serratures 2 on each side
11873 Branches spiked, Scales of invol. long, Peduncles scaly, Leaves very long smooth sessile
11874 Leaves entire bluntly mucronate: radical oblong stalked; cauline cordate ovate sessile
11875 Stem nearly naked, Rad. leaves spatulate smooth dotted: cauline linear, Heads corymbose
11876 Leaves lanc. 3-nerved scabrous somewhat toothed sessile, Stem panicled, Ray shorter than disk
11877 Pedunc. alternate (scarcely racemose) single-fl. Pappus as long as the florets of the ray, Lvs. lanc. obtuse
11878 Stems with usually only one fl. Pappus much shorter than the florets of the ray, Lvs. lanceolate
11879 Stem 1-flowered, Invol. pilose
11880 Leaves ciliated glaucous clammy: radical with winged stalks and few teeth; cauline sessile entire
11881 Leaves pinnatifid; segments of the cauline leaves linear entire; of the radical lanc. somewhat toothed

11882 Scape 1-fl. naked, Head radiated nodding, Lvs. stalked obovate toothed sinuated at base downy beneath
11883 Scape 1-fl. nearly naked, Head discoid, Lvs. reniform toothed smooth
11884 Scape 1-fl. nearly naked, Head discoid, Lvs. reniform toothed downy beneath
11885 Scape about 1-fl. nearly naked, Head discoid, Lvs. smooth reniform slightly 7-lobed
11886 Scape single-fl. imbricated with scales, Lvs. cordate angular toothed downy beneath
11887 Thyrsus fastigiate, Heads radiant, Lvs. roundish cordate unequally toothed downy beneath
11888 Thyrsus fastigiate, Heads radiant, Lvs. roundish cordate equally toothed downy beneath
11889 Thyrsus fastigiate, Heads discoid, Lvs. orbicular cordate doubly and finely toothed
11890 Thyrsus oblong, Heads discoid, Lvs. obl. cordate unequally toothed white beneath: lobes spreading
11891 Thyrsus ovate-oblong, Lvs. cordate unequally toothed with the lobes approximate downy beneath

11892 Thyrsus oblong, Heads discoid, Lvs. obl. cordate unequally toothletted snow-white beneath
11893 Thyrsus fastigiate, Heads obsoletely radiant, Lvs. roundish cordate half 7-lobed downy beneath

11894 Heads flosculous, Cor. naked, Invol. ventricose somewhat imbricated, Lvs. filiform lin. entire smooth
11895 Heads flosculous, Cor. naked, Lvs. obl. amplexicaul. unequally and deeply toothed, Stem virgate
11896 Heads flosculous, Cor. naked, Lvs. lyrate hairy: upper lanc. toothed
11897 Heads flosculous, Cor. naked, Lvs. ellipt. tooth-serrated hairy, Peduncles long many-flowered
11898 Heads flosculous, Cor. naked, Lvs. lyrate pilose on each side viscid
11899 Heads flosculous, Cor. naked, Lvs. lanc. toothed scabrous, Flowering branches spreading
11900 Heads flosculous, Cor. naked, Lvs. obl. lanc. finely serrated smooth, Heads corymbose
11901 Heads flosculous, Cor. naked, Lvs. lyrate pinnatifid toothed, Scape nearly naked
11902 Heads flosculous, Cor. naked, Lvs. obl.-pinnatifid toothed acuminate stalked cuneate at base
11903 Heads flosculous, Cor. naked, Lvs. pinnatifid: segm. lanc. acute cut, Stipules leafy subpalmate

and Miscellaneous Particulars.

dipped in a solution of saltpetre, and dried in the sun, makes an excellent tinder. The leaves are the basis of the British herb tobacco; they have been regarded as expectorant from the earliest ages, having been smoked through a reed in the days of Dioscorides, with the view of relieving the chest from accumulated mucus in catarrh, asthma, and phthisis. At present, though it occupies a place in the Materia Medica, very little reliance is placed on its powers. (*London Disp.* p. 542.)

T. Petasites, from the Greek πέταυρος, a broad covering, in allusion to the leaves, which are larger than those of any British plant, and afford shelter from rain to poultry and other small animals. It is called Butter bur, in allusion to a former application, and Pestilent-wort, from its supposed efficacy in the plague. T. hybrida is by some considered, a variety of this species, as T. alba is of T. paradoxa. T. fragrans is valued in gardens as an early and fragrant flower; like all the species, it is apt to run very much, and is therefore best kept in pots.

It is remarkable that no plant belonging to the tribe of Tussilagineæ, has been discovered with hermaphrodite flowers. They are distinguished from other tribes by their stigma, which occupies both surfaces of the lobes of the style. They are nearly all natives of Europe.

1738. *Senecio.* For the explanation of this word, see Erigeron. Most of these species are annual weeds, or

History, Use, Propagation, Culture,

rude gigantic yellow flowered autumnal perennials; S. venustus and cinerascens, however, are elegant plants with purple flowers. Of S. elegans there is a double flowered variety, common in green houses, and readily propagated by cuttings.

Senecio hieracifolius is the pest of newly cleared ground in North America, as S. vulgaris is in Europe. It is known by the name of the Fire-weed.

Senecio vulgaris is esteemed emollient and resolvative. It is employed in spitting of blood, in the form of a poultice, and against the gout and hæmorrhoids. It is given to horses suspected to be troubled with worms.

11904 Herb downy upwards, Lvs. sinuate toothed and pinnatifid, Heads clustered, Involucre cylindrical
11905 Herb hirsute, Lvs. broad-lanc. sinuate-toothed and toothletted: teeth callous at end, Heads panicled
11906 Leaves semiamplexicaul. pinnatifid toothed, Heads in clustered corymbs destitute of a ray
11907 Heads flosculous, Cor. naked, Leaves subbipinnate stalked smooth, Involucre not withered
11908 Heads radiant, Leaves half-amplexic. pinnatifid, Segments linear acute toothed distant, Peduncles long
11909 Heads flosculous, Cor. naked, Leaves obovate stalked cut-toothed, Pedunc. filiform 3-headed
11910 Heads radiate, Ray revolute, Leaves stalked obl. sinuate, Pedunc. 3-headed, Involucre conical
11911 Heads radiate, Ray revolute, Leaves amplexic. lin. lanc. pinnatifid, Scales of involucre sphacelate in part
11912 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate-linear fleshy bluntly sinuated
11913 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate toothed, Scales of involucre all unwithered
11914 Heads radiate, Ray revolute, Leaves amplexicaul. obovate 3-lobed at end serrated
11915 Heads radiate, Ray revolute, Leaves pinnatifid downy revolute at edge, Panicle spreading
11916 Leaves amplexicaul. cut toothed scabrous above downy beneath, Heads racemose
11917 Ray revolute, Leaves pinnatifid and viscid, Scales of the involucre lax hairy
11918 Ray revolute, Lvs. sess. pinnatifid lobed and toothed, Scales of involucre very short glab. Stem erect straight
11919 Ray revolute, Leaves lyrate sinuate blunt stalked, Stem hirsute [corymbose
11920 Ray revolute, Leaves amplexicaul. lanceolate blunt toothed entire
11921 Heads radiate, Petiole amplexicaul. Peduncles 3 times as long as pinnate sinuated leaves
11922 Heads radiate, Leaves amplexicaul. pinnatifid hirsute crisp-toothed, Stem woolly
11923 Cor. radiant, Leaves pinnated multifid: segm. filiform smooth, Heads corymbose
11924 Cor. radiant, Lvs. amplexic. pinnatifid glabrous above: segm. angular toothed, Stem and involucre glabrous
11925 Cor. radiant, Stem involucre and leaves glabrous, Leaves pinnatifid: segm. linear acute toothed
11926 Cor. radiant, Leaves pilose viscid pinnatifid equal spreading, Rachis narrowed below

11927 Cor. radiant, Leaves half-amplexicaul. pinnatifid: segm. linear subdentate distant
11928 Cor. radiant, Stem simple nearly naked, Radical leaves stalked oblong toothed ciliated
11929 Cor. radiant, Leaves pinnatifid toothed somewhat hairy, Stem erect
11930 Cor. radiant, Leaves tomentose oblong toothed, Stem leafy 1-flowered
11931 Cor. rad. Lvs. toment. on each side snow-white pinnatif.: segm. lin. blunt somew. tooth. Corymb contracted
11932 Cor. radiant, Leaves pinnate multifid linear naked acute, Peduncles about 2-flowered
11933 Cor. radiant, Leaves pinnate: pinnæ lin.-subulate somewhat cut downy beneath, Stem somewhat hairy
11934 Ray spreading, Leaves lyrate bipinnatifid divaric. toothed glabrous, Stem erect, Pericarps hairy
11935 Ray spreading, Florets elliptical, Leaves lyrate serrated: lower obovate entire, Pericarps glabrous
11936 Cor. radiant, Rad. lvs. ovate-cordate serrated stalked: cauline pinnatifid toothed, Peduncles thickened
11937 Cor. radiant, Lvs. lanc. lin. nearly entire smoothish, Corymb contracted terminal stalked
11938 Cor. radiant, Lvs. lanc. lin. toothed rigid scabrous, Corymbs terminal and axillary stalked
11939 Cor. radiant, Lvs. lanc. lin. subtomentose glauc. finely toothletted or entire, Corymb contracted terminal
11940 Cor. radiant, Leaves linear entire, Corymb squamose, Stem herbaceous
11941 Cor. radiant, Lvs. half amplexicaul. lanc. finely serrate subvillous beneath, Corymb terminal spreading
11942 Cor. radiant, Lvs. ovate lanc. serrated ciliated at edge sessile unequal at base
11943 Ray spreading, Lvs. lanc. sharply serrated nearly glabrous, Corymbs of rather few flowers
11944 Cor. radiant, Lvs. ovate-lanc. finely serrated smooth on each side subsessile
11945 Cor. radiant, Outer scales of invol. subulate spreading, Lvs. subdecurrent obl. lanc. villous
11946 Cor. radiant, Lvs. sess. obovate toothed at end glaucous: younger silky, Corymb compound terminal
11947 Cor. radiant, Lvs. toothed: lower ovate decurrent in the stalk: upper cordate obl. amplexicaul.
11948 Cor. radiant, Scales of invol. appressed, Lvs. subdecurrent villous beneath lanc. serrated
11949 Cor. radiant, Outer scales of invol. spreading, Lvs. subdecurrent obl. lanc. glauc. serrate
11950 Cor. radiant, Stem undivided about 1-fl. Lvs. undivided serrated: radical ovate villous beneath
11951 Cor. radiant, Lvs. lanc. cordate at base amplexicaul. smooth finely serrated
11952 Cor. radiant, Lvs. lin. scattered
11953 Cor. radiant, Lvs. obovate fleshy somewhat toothed
11954 Cor. radiant, Lvs. obl. sessile toothed downy beneath: upper amplexicaul. toothed only at base
11955 Cor. radiant, Lvs. amplexicaul. spatulate repand eroded scabrous

§ 1. *Shrubby.*

11956 Leaves ovate subimbricated recurved serrate-ciliated, Heads terminal
11957 Leaves ovate serrate spreading downy beneath, Heads terminal about 3
11958 Leaves obl. lanc. sessile entire 3-nerved silky with down, Flowers terminal
11959 Leaves stalked roundish ovate hairy with 1 or 2 teeth on each side, Peduncles 1-headed long terminal
11960 Stem fluted, Leaves alternate stalked lanc. blistered repand-toothed downy beneath, Flowers panicled
11961 Leaves ovate lanc. toothed silky beneath, Panicles compound axillary, Rays 3

and Miscellaneous Particulars.

The tribe of Senecioneæ is nearly related to Anthemideæ, and a portion of Inuleæ, from which the differences in the style are insufficient to distinguish them. They appear, however, to be sufficiently well characterized by their other floral organs. They are found in every part of the world, especially in the south of Africa. Humboldt has observed, that they are very numerous in the upper region of the Andes, just below the limits of eternal snow, where the sun has little influence, where hurricanes are incessant, and not a tree is able to rear its head.

1739. *Aster.* The flowers of all the species of Aster resemble little stars, on account of the numerous rays

History, Use, Propagation, Culture,

of their circumference. A very numerous genus of plants, commonly called in England, Christmas Daisies, in allusion to the late period of the year at which they blossom. They are not very ornamental, and yet their flowers are acceptable at a season when few others are to be seen in open air. The species are extremely

11962 Leaves linear acute not dotted somewhat hoary, Pedunc. term. solitary 1-fl. long
11963 Leaves linear filiform obtuse hairy, Invol. imbricated
11964 Leaves linear fleshy smooth dotted blunt, Pedunc. 1-headed, Invol. imbricated shorter than disk
11965 Leaves linear blunt glabrous dotted, Pedunc. 1-headed long, Invol. imbricated as long as disk
11966 Leaves linear filiform fasicled smooth dotted, Ligules entire
11967 Leaves linear scattered revolute at edge: prickly above; downy beneath, Heads in racemose panicles
11968 Stem and leaves rough, Leaves dense linear reflexed, Flowering branches short racemose
11969 Leaves obl. narrowed at each end sess. Stem somew. climbing, Branches downy, Scales of invol. squarrose

§ 2. *Herbaceous.*

* *Leaves entire.*

11970 Leaves lin. lanc. 3-nerved dotted acute scabr. at edge, Ray about 5-fl. Invol. imbric. twice as short as disk
11971 Lvs. lin. lanc. obsol. 3-nerv. blunt scab. at edge, Hds. in sess. clust. Ray about 5-fl. Inv. imbr. short. than disk
11972 Lvs. cuneate obov. acute nervel. scab. on each side twisted spread. Inv. cylindr. imbr. with 2 bractes at base
11973 Lvs. lin. lanc. narr. at base nerveless roughish revolute at edge, Inv. lax imbr. Branches filiform 1-headed

11974 Lvs. lin. mucro. somew. keeled rigid scabrous at edge: cauline reflexed; of the branches much spreading
11975 Lvs. many lin. mucron. nerveless not dotted keeled scabrous rigid, Branches fastigiate 1-headed
11976 Lvs. narrow lin. nerveless not dotted smooth erect, Branchlets term. nearly naked 1-headed
11977 Lvs. lin. nerveless dotted scabr. reflexed spreading, Branches corymb. fastigiate leafy, Invol. imbr. short
11978 Lvs. lin. lanc. hoary, Stem branched villous, Branchlets somew. 1-sided 1-headed, Invol. obl. lax imbricated
11979 Lvs. lin. lanc. narrowed at each end acum. Stem downy panicled erect, Branches few-headed, Inv. imbr.
11980 Very smth. with small fl. Stem panicled, Branch. many-head. Lvs. lin subulate, Invol. cylindr. Ray minute
11981 Lvs. lin. lanc. narrow. both ways hispid at edge, Stem smth. branched erect, Branches 1-headed, Inv. imbr.
11982 Lvs. lin. glabrous: those of the branches very short, Branches panicled, Invol. cylindr. closely imbricated
11983 Lvs. lin. glab.: those of the branches subul. close together; of the stem long. Invol. subsquarr. Leafl. acute
11984 Lvs. lin. glab. Stem much branched diffuse downy, Branchlets 1-sided, Inv. imbr.: scales obl. squarr. acute
11985 Lvs. ciliat.: caul. lin. lanc. nerv.: those of the br. very short lanc. 3-nerv. Stem branch. downy, Br. panic.
11986 Hoary, Lvs. lin. Panic. corymb. much branched leafy, Invol. imbr. very acute longer than disk [at base
11987 Lvs. remote lin. amplexicaul. erect very smth. scabr. at edge, Pedunc. almost naked, Inv. squarr. with 2 lvs.
11988 Very smth. Lvs. subul. lin. somew. fleshy subreflex. Stem slender much branch. Branchl. setaceous 1-head.
11989 Lvs. very numerous lin. blunt reflexed hispid at edge, Stem branch. diffuse smooth, Branches 1-headed
11990 Dwarf with creeping roots, Stems weak simple, Lvs. long lanc smoothish, Invol. with lin. obl. blunt scales
11991 Lvs. very numerous ovate-acum. reflexed hispid at hedge, Stem branched hairy, Branches 1-headed
11992 Lvs. obl. lanc. silky sess. Stem slender decumbent loosely branched, Branchlets and branchlets 1-headed
11993 Lvs. obl. lanc. hoary on each side, Stem simple erect downy, Raceme terminal
11994 Cauline leaves amplexicaul. scabrous: of the branches small, Invol. imbricated: scales length of disk
11995 Hoary all over, Lvs. lanc. obl. acute at each end sess. revolute at end netted and 3-nerved beneath
11996 Smooth, Lvs. obl. ovate acuminate shortly stalked scabrous at edge, Panicles few-headed, Stem smooth
11997 Lvs. subrhomboid oval-lanc. acuminate at each end somew. stalked glabr. hispid at edge, Corymb diverging
11998 Lvs. lanc. narrowed at base acuminate scabrous at edge, Stem simple corymb. at end, Invol. loosely imbr.

11999 Lvs. lin. lanc. nearly entire smth. Stem smth. panicled at end, Invol. lanc. imbr. Scales acute spread. at end
12000 Lvs. lanc. somewhat amplexical. narrowed at end scabrous at edge, Stem erect hispid, Branchlets pilose
12001 Lvs. lin. lanc. pilose amplexicaul. auricled at base, Stem simple pilose straight, Heads sess. term. clustered

12002 Lvs. lin. lanc. amplexicaul. polished, Stem virgate panicl. Branches racemose, Inner scales of invol. colored

12003 Lvs. lin. rigid acute subamplexicaul.: those of the branches reflexed hispid at edge, Scales of invol. squarr.
12004 Lvs. lanc. cordate amplexicaul. downy beneath, Stem quite simple downy, Pan. term. lax few-headed
12005 Lvs. obl. lanc. ciliate cordate amplexicaul. scabrous on each side hairy, Stem branched hairy
12006 Stem 1-fl. Rad. lvs. lanc. spatulate: cauline lanc. Scales of invol. nearly equal lanc. bluntish
12007 Stem 1-fl. Rad. lvs. spatulate: cauline lin.-lanc. Scales of invol. nearly equal linear acuminate
12008 Lvs. lin. remote 3-nerved acuminate dotted scabrous at edge, Branches corymb. fastigiate, Ray 10-fl.
12009 Lvs. lin. lanc. glabrous not dotted 3-nerved, Invol. imbricated twice as short as disk
12010 Lvs. lin. lanc. 3-nerved hoary on each side, Invol. twice as short as disk imbricated
12011 Lvs. lin. lanc. hispid at edge, Stem simple corymbose, Scales of invol. lanc. blunt equal
12012 Lvs. obl. lanc. scabrous, Invol. imbr. subsquarrose: lvs. blunt; inner membranous colored at edge
12013 Lvs. lin. lanc. sessile scabrous at edge, Stem panicled smooth, Invol. lax imbricated
12014 Lvs. lin. lanc. rarely toothed long smooth, Heads terminal, Invol. squarrose

** *Leaves lanceolate and ovate: lower serrate.*

12015 Lvs. ov.-obl. acute amplexicaul. cordate serrated smooth, Stem panicled smooth, Branches 1-2-headed
12016 Lvs. amplexicaul. spatulate lanc. acuminate serrated in middle cordate at base, Branches pilose
12017 Lvs. amplexic. lanc.: lower subserr. smooth; of the branches lin. squarr. Invol. squarr. shorter than disk
12018 Lvs. subamplexicaul. broad-lanc. subserrate smooth, Stem glabrous, Branches many-headed

and Miscellaneous Particulars.

difficult to distinguish: the most ornamental are A. puniceus, Novæ Angliæ, pulchellus, and macrophyllus A. chinensis is a well known border annual; of which there are varieties of different colors, and semi-double, and double. It is raised on a hotbed, and transplanted into the open ground in April or May.

History, Use, Propagation, Culture,

Astereæ are chiefly characterized by their style, which, in its most complete state, is alone sufficient to distinguish them from every other tribe. They are found in every part of the world, but especially in North America and Africa.

1740. *Solidago.* From *solidari*, to unite, on account of the vulnerary qualities of the plants. The species are all autumnal coarse-looking herbaceous plants with yellow flowers; in the shrubbery they make a pretty

12019 Lvs. subamplexicaul. broad-lanc. subserrate smooth, Stem glabrous, Scales of invol. shorter than disk
12020 Lvs. subamplexic. : upper lanc. acumi. entire; lower lanc. narrowed at base serrated, Branchlets virgate
12021 Lvs. subamplexicaul. remote obl. entire lucid : radic. subserrated, Invol. imbr. with cuneiform leaflets
12022 Lvs. subamplexicaul. lanc. lower subserrate smooth, Stem simple panicled at end, Invol. closely imbricated
12023 Lvs. amplexicaul. lanc. serrate roughish, Branches panicled, Invol. lax longer than disk
12024 Lvs. obl. lanc. scabrous ciliated : lower ovate, Stem hispid, Branches 1-headed, Scales of invol. obl. imbr.
12025 Lvs. subamplexicaul. lanc. : lower serrated, Stem smooth, Branches corymbose
12026 Lvs. subamplexicaul. lanc. glabrous scabrous at edge : lower subserrated, Branches divided
12027 Lvs. amplexicaul. narr. lanc. scabr. above lower subserr. Stem much branched, Invol. with spread. scales
12028 Lvs. lanc. roughish somewhat amplexicaul. : lower serrate in the middle, Scales of invol. lax leafy
12029 Lvs. obl. lanc. acuminate sessile smooth scabrous at edge : lower serrated, Branches corymbose smooth
12030 Lvs. sessile serrated smooth spatulate lanc. narrowed at base and bent down towards each side
12031 Lvs. subamplexic. obl. lanc. acuminate serrated smooth, Stem pyramidal, Racemes scarcely longer than lvs.
12032 Lvs. ov. coarsely toothed stalked : cauline sessile cuneate at base, Stem hispid, Branches with single heads
12033 Lvs. broad lanc. narrow. at base entire with a very long point, Stem simp. flexuose angul. Panic. corymb.
12034 Lvs. obl. 3-nerved narrowed at base acute : upper sess. nearly entire; lower stalked serrated, Stem corymb.
12035 Lvs. lanc. serrate acuminate rugose very rough, Stem erect angular simple
12036 Lvs. sess. narrow lanc. serrated scabrous, Stem 1 or few-headed
12037 Lvs. lanc. sess. serr. smooth, Branches virgate, Invol. imbricated, Stem round smooth
12038 Lvs. sess. narrow lanc. : lower serrated in middle, Stem branched smooth recurved, Invol. lax imbricated
12039 Lvs. lin. lanc. acumin. scabrous at edge : lower subserrated, Stem panicled, Branches 1-headed
12040 Lvs. lin. lanc. acumin. scabrous at edge : lower subserrated; cauline reflexed, Stem lax panicled
12041 Lvs. lanc. acum. scabrous at edge : cauline serrated at end; those of the branches entire, Stem panicled
12042 Lvs. lin. entire : radic. obl. subserrated, Stem much branched downy, Invol. loosely imbricated
12043 Lvs. lanc. lin. sessile smooth : lower subserrate, Stem panicled smooth, Invol. imbricated
12044 Lvs. lin. lanc. sessile entire smooth : lower lanc. subserrate, Stem branched diffuse smoothish
12045 Lvs. lin. acuminate entire : lower lin. lanc. subserrate, Branches corymbose, Invol. imbricated
12046 Lvs. lin. acuminate entire : radical obl. serr. Branches in corymbose panicles, Invol. imbricated
12047 Lvs. sess. lanc. serrated smooth, Invol. imbricated : leaflets acute, Stem rather villous
12048 Lvs. ellipt.-lanc. serrated smooth : cauline lan.-lanc. long, Branches spreading, Invol. imbr. Stem pubesc.
12049 Lvs. ellipt.-lanc. serrated smooth even-sized, Branches spreading, Invol. imbricated, Stem pubescent
12050 Lvs. ellipt.-lanc. serr. smooth : those of the branches distant, Branches much spreading pendulous
12051 Stem 1-fl. Lvs. ovate sessile scabrous, Scales of invol. nearly equal linear
12052 Lvs. lin. lanc. entire blunt mucronate 3-nerved at base veiny, Stem simple corymbose downy
12053 Lvs. filiform aculeate ciliate, Invol. hemispherical, Leaflets equal
12054 Stem glabr. corymb. Lvs. lin.-lanc. fleshy obscurely 3-nerv. Scales of invol. lanc. membran. obt. imbricated
12055 Leaves lanc. subamplexicaul. serrate pilose scabrous, Invol. lax : leafl. lanc. acuminate foliaceous hispid
12056 Leaves scabr. : caul. obl. lanc. acute; radical obl. stalked, Scales of invol. obl. cuneate blunt subsquarrose
12057 Leaves sessile obl. lanc. serrate : floral ciliated, Stem branched glabrous, Invol. closely imbricated
12058 Lvs. obl. lanc. serrat. narrow. at base, Stem hairy, Inv. imbric. nearly equal, Outer scales somew. spreading

**** Leaves cordate and ovate, serrate.*

12059 Leaves obl. cordate amplexicaul. entire, Petioles winged, Stem panicled hispid, Branchlets 1-sided
12060 Leaves ovate-lanc. subserrated stalked smooth, Petioles naked, Stem much branched smooth, Invol. lax
12061 Leaves cordate pilose beneath finely serrated stalked, Stem panicled smoothish, Panicle spreading
12062 Leaves ov. finely serrated acum. smoothish : lower cord. stalked, Branches hairy, Scales of invol. blunt
12063 Leaves ovate stalked serrated scabrous : upper ovate cordate sessile, Stem branched diffuse, Scales acute
12064 Leaves smooth : cauline ovate subcord. acuminate deeply serrated entire at end, Stem panicled smooth
12065 Leaves ovate narrowed at base entire about 5-nerved, Invol. lax squarrose, Ray very fine

§ 1. *Racemes 1-sided, Leaves 3-nerved.* [exceeding disk

12066 Stem downy, Lvs. lanc. serrat. triple-ribb. rough, Clusters copious panicl. unilateral recurv. Radius hardly
12067 Leaves obl. 3-nerved subserrated, Racemes 1-sided, Ligulæ middling, Stem smooth, Peduncles downy
12068 Stem villous erect, Lvs. lanc. serrated triple-ribbed rough villous beneath, Clusters spiked erect drooping before flowering, Radius short
12069 Stem erect round very smooth, Leaves lin.-lanceol. smooth triple-ribbed serrated rough-edged, Clusters panicled unilateral, Stalks downy
12070 Stem erect smooth, Lvs. lanc. smooth serrated rough edged obscurely triple-ribbed, Clusters paniculated unilateral, Stalks hairy, Radius short
12071 Stem erect smooth, Leaves lanc. somewhat triple-ribbed smooth rough-edged slightly serrated, Clusters panicled unilateral, Stalks smooth, Bract. fringed, Radius short
12072 Stem erect vill. Lvs. lanc. somew. serrat. triple-ribbed rough reflexed, Clusters panicled slightly unilateral
12073 Stem erect rather hairy, Lvs. lanc. obscurely triple-ribbed smooth rough-edged : the lower ones slightly serrated, Clusters panicled unilateral somewhat recurved

and Miscellaneous Particulars.

appearance among other coarse things, but there is not one of them which is worth a place in a choice collection of ornamental plants. The leaves of the Solidago odora have a delightfully fragrant odor, partaking of that of anise and Sassafras, but different from either. When subjected to distillation, a volatile oil, possessing the taste and aroma of the plant in a high degree, collects in the receiver. This oil apparently has its residence in the transparent cells which constitute the dotting of the leaves. The effects of the S. odora are

History, Use, Propagation, Culture,

aromatic, pleasant to the taste, gently stimulant, diaphoretic, and carminative. An essence made by dissolving the essential oil in proof spirit, is used in the eastern states as a remedy in complaints arising from flatulence, and as a vehicle for unpleasant medicines of various kinds. It has been employed successfully to allay vomit-

§ 2. *Racemes 1-sided. Leaves not 3-nerved.*

12074 Stem erect round hairy, Lvs. ov. rather ellipt. very rough rugged serrated without lateral ribs, Clusters panicled unilateral
12075 Stem erect hairy, Lvs. lanc. the lower ones deeply serrated very rough rugose, Panicles unilateral
12076 Stem erect hairy, Lvs. ovate-lanc. the lower ones closely serrated rugged very rough, Clusters panicled compound widely spreading unilateral
12077 Stem erect vill. Lvs. lanc. rather soft serrated without lateral ribs, Clusters panicled unilateral
12078 Stem erect hairy, Lvs. oblong pointed smooth above rugged and rough beneath, Clusters unilateral
12079 Stem erect downy, Stem lvs. lanc. hisp. ent. : radic. ones somew. wedge-shap. serrat. Clust. panic. unilateral
12080 Stem erect smooth angular, Lvs. ellipt. serrated smooth : the radic. ones obl.-spatulate, Clusters panicled unilateral spreading, Pedunc. downy
12081 Stem erect striated smooth, Lvs. ellipt. pointed deeply serrated vill. beneath : radical ones obovate, Clusters panicled unilateral, Pedunc. villous, Rays short
12082 Stem erect smooth, Lvs. smooth sharply and unequally serr. : those of the stem ellipt. ; radical ones ovate-obl. Clusters panicled unilateral, Rays elongate
12083 Stem erect smooth, Lvs. lanc. smooth rough-edged : the lower ones serrated, Clusters panicled unilateral
12084 Stem erect smooth, Lvs. ellipt. smooth serrated, Clusters panicled unilateral, Rays of a middling length
12085 Stem erect downy, Lvs. lanc. serrated rough edged, Clusters elongated unilateral recurved panicled
12086 Stem erect smth. Lvs. lin.-lanc. rather fleshy smth. entire rough-edg. Clust. panic. unilateral, Ped. roughish
12087 Stem erect striated downy, Lvs. lin.-lanc. entire smooth rough-edged, Clust. panic. unilateral nearly simple

§ 3. *Racemes erect.*

12088 Smooth somewhat shrubby, Lvs. lanc. obtuse without ribs, Panicle compound many-fl. tuft of flowers erect, Invol. narr.-oblong with 5 flor. in the disk and 1 in the radius
12089 Stem hairy, Lvs. ellipt. hairy : the lower ones serr. ; those on the fl.-branches entire numerous and small, Clusters erect, Scales of invol. obtuse
12090 Stem erect villous, Lvs. ellipt. roughish stalked, Clusters erect, Rays twice the length of the invol.
12091 Stem erect smth. Stem-lvs. lanc. entire smth. rough-edg. : radic. ones serrat Clust. panic. erect, Ped. smth.
12092 Stem smooth. furrowed much branched, Lvs. almost lin. ent. roughish nearly erect with 3 or 5 rough ribs, Rays not longer than the disk
12093 Stem rough angular branch. corymb. Lvs. spread. lin. very narr. slightly 3-ribb. rough with axilla tufts of smaller ones, Rays scarcely exceeding the disk
12094 Stem nearly erect very smooth and even, Lvs. lanc. smooth with roughish edges and ribs, Clusters erect, Rays rather longer than the disk
12095 Stem smooth panic. Lvs. lanc. serrat. smth. rough-edged, Branches racemose at the extremity, Rays elong.
12096 Stem panic. hairy, Lvs. lanc. rough on both sides : those of the stem serrat. ; of the branches ent. Clusters erect, Rays elongated
12097 Stem branch. downy, Lvs. lanc. rough on both sides tapering 3-ribb. entire, Clusters erect, Rays elongated
12098 Stem erect smth. Lvs. lanc. fleshy entire smooth in every part, Clusters panic. erect, Pedunc. scaly hairy, Radius twice the length of invol.
12099 Stem oblique smooth, Lvs. lanc. somew. fleshy entire smooth in every part, Clusters panic. erect, Pedunc. scaly smooth, Rays longer than invol.
12100 Stem erect slightly downy, Lvs. lin. lanc. smooth rough-edged tapering at the base : the lower ones somew. serrated, Clusters erect, Rays elongated
12101 Stem rather vill. Lvs. lanc. veiny smooth entire somewhat stalked
12102 Lower lvs. ov. pointed taper. unequally and sharply serr. smooth : those of the stem lanc. tapering at each end serr. nearly sess. Clusters axill. stalked leafy the length of the leaves
12103 Stem zig-zag roundish smooth, Lvs. lanc. pointed serrated smooth nearly sess. Clust. axill. erect
12104 Stem somew. zig-zag angular smooth, Lvs. ovate pointed strongly serrated smooth : tapering into a winged footstalk, Clusters axillary erect
12105 Stem slightly zig-zag smooth angul. branch. Lvs. ov.-lanc. pointed densely serrated rather hairy beneath tapering into a wing. footstalk : upper ones ent. Clust. axill. erect the upper ones much long. than the lvs.
12106 Stem smooth round erect, Lvs. lanc. serr. glabrous, Racemes axill. subglobose erect, Rays long
12107 Cauline leaves lanc. : the lower ones ellipt. Racemes panicled erect crowded
12108 Stem quite simple downy, Lvs. cuneiform lanc. downy, Racemes erect, Rays long
12109 Stem a little villous, Lvs. sessile lanc. smooth ciliated : lower serrated at end, Rays long numerous
12110 Stem quite simple pilose, Lvs. lanc. acute serrated smooth, Raceme term. simple erect, Rays long
12111 Stem simple erect smooth, Lvs. lanc. serrated smooth tapering and elongated at the base, Clusters erect
12112 Stem hairy round, Lvs. lanc. rather hairy beneath, Clusters erect, Rays elongated
12113 Lvs. ov.-obl. rough like the corymbose stem with minute rigid hairs : the lowermost serrat. ; upper entire, [Clusters compact, Rays twice the length of the obtuse calyx

12114 Pedunc. branched, Lvs. reniform narrowed somewhat lobed downy, Petioles auricled at end
12115 Pedunc. branched, Lvs. cordate 5-lobed toothed woolly, Petioles with appendages, Ray 3-flowered

12116 Heads corymbose, Lvs. cordate somewhat angular downy beneath, Petioles auricled at base

and Miscellaneous Particulars.

ing, and to relieve spasmodic pains in the chest of a milder kind. The leaves are also used in some parts of the United States as an agreeable substitute for tea. (*Bigelow.*)

History, Use, Propagation, Culture,

often the upper surface of the leaves. C. discolor, populifolia, &c. are popular half-shrubby plants, well calculated for bearing the confined air of a sitting room. Most of the hardy herbaceous species are fine ornamental plants of easy culture. C. lanata and amelloides flower the greater part of the year; the former species is considered the handsomest of the genus; its petals exteriorly are of a most vivid purple, interiorly they are white.

1742. *Calotis.* The name has been derived from καλος, beautiful, and ους ωτος, an ear, in allusion to the two membranous ear-shaped paleæ of the pappus. A pretty little New Holland herbaceous plant.

1743. *Kaulfussia.* Named after Dr. George Frederick Kaulfuss, professor of botany at Halle, a distinguished living Cryptogamic botanist. A small plant with bright blue flowers.

1744. *Inula.* The derivation of this word is uncertain. The Latins applied it to a plant which was eaten as

12117 Lvs. cordate angular downy beneath, Corymbs terminal panicled, Scales of invol. recurved at end
12118 Heads corymbose, Lvs. cordate angular toothed purple beneath, Petioles winged auricled at base
12119 Pedunc. about 1-headed, Branches corymb. Lvs. cord. angular toothed downy beneath, Petioles winged
12120 Heads corymbose, Lvs. cordate subangular downy beneath, Petioles with many appendages at end
12121 Heads subcorymbose, Lvs. roundish many-lobed smooth, Petioles auricled at base, Invol. calyculate
12122 Heads cymose, Lvs. cordate angular downy beneath, Petiolcs simple
12123 Leaves large round lobed downy and green on each side
12124 Heads corymbose, Leaves oblong lanc. acuminate toothletted smooth white beneath
12125 Lvs. cord. subangular smooth above downy beneath, Petioles with an appendage at top, Heads corymb.
12126 Stem simple, Heads panicled, Lvs. smooth tooth. : lower deltoid stalked : upper obl. lanc. amplexicaul.
12127 Panicles axillary, Lvs. alternate stalked broad lanc. serrated smooth above hoary beneath [above
12128 Heads corymb. Invol. hoary pubesc. Lvs. obl. pinnatif. at base : segm. somew. toothed shining and smooth
12129 Raceme simple, Lvs. reniform toothletted, Petiole inflat. Stem simple leafy, Bractes in the midd. of stalk
12130 Raceme simple, Lvs. cordate blunt toothletted smooth, Stem simple 1-leaved
12131 Heads corymb. Lvs. cauline ov. acute finely serrated downy beneath : petioles winged at base ; radic. cord.
12132 Raceme simple, Lvs. spatulate cordate entire smooth, Stem simple
12133 Heads corymbose, Lvs. broad lanc. tooth-sinuated, Stem villous
12134 Heads umbellate, Stem simple, Lvs. downy : radical ovate subcrenulate ; cauline lanc. entire

12135 Heads in corymbose umbels, Stem simple, Lvs. somewhat toothed : radic. spatulate ; caul. obl. lanc.
12136 Panicle few-headed, Stem simple, Lvs. all stalked cordate doubly toothed, Petioles toothed at base
12137 Heads corymbose, Lvs. pinnated : term. pinnæ large cordate cut-toothed ; lateral cuneate toothed at end
12138 Heads panicled, Invol. downy, Lvs. pinnatifid : segments blunt about 3-lobed downy beneath
12139 Heads panicled, Lvs. pinnatifid subvillous : segments sinuated, Stem herbaceous
12140 Pedunc. 1-headed axillary, Lvs. linear subulate glabrous, Stem shrubby
12141 Pedunc. 1-headed, Lvs. reniform somewhat angular, Petioles auricled at end or naked
12142 Pedunc. 1-headed, Lvs. pinnatifid lobed acute viscid fleshy
12143 Pedunc. 1-headed, Lvs. cordate roundish with 7 angles woolly beneath
12144 Pedunc. 1-headed, Lvs. opposite ovate naked

12145 Leaves cuneate cut-toothed at end

12146 The only species

12147 Lvs. amplexic. somewhat toothed ovate rugged downy beneath, Scales of the involucre downy
12148 Leaves amplexic. oblong entire hirsute, Stem pilose corymbose
12149 Leaves amplexic. lanc. serrated at base pilose beneath, Stem corymbose villous
12150 Leaves amplexic. cordate lanceolate wavy
12151 Leaves amplexic. cordate lanc. quite smooth serrated, Stem corymbose smooth, Pedunc. 1-headed filiform
12152 Leaves oval rigid sessile serrulate scabrous netted, Scales of invol. ovate reflexed
12153 Leaves sessile reflexed at base lanc. serrated, Stem downy clammy, Peduncles axillary leafy
12154 Leaves sessile lanc.-lin. Stem pilose branched, Branches spreading 1-headed, Root tuberous

12155 Leaves lanc. recurved serrate scabrous, Branches angular, Lower heads tallest
12156 Lvs. sess. obl. obsoletely serrated : serratures glandular, Stem hairy 1-headed, Scales of invol. lanc. villous
12157 Lvs. sess. obl. with cartilaginous teeth scabrous rigid, Stem corymbose, Scales of invol. blunt squarrose
12158 Lvs. sessile lanc. bluntly serrated rigid pilose, Stem villous 1-headed, Scales of invol. lanceolate
12159 Leaves ellipt. narrowed at base stalked pilose : lower toothed, Stem many-flowered
12160 Leaves sessile oblong lanc. serrated downy beneath, Heads stalked about 4 in terminal umbels
12161 Leaves lanc. acute serrulate hairy, Lvs. of invol. lanc. hairy outer reflexed
12162 Leaves amplexicaul. toothed very hairy : radical ovate ; cauline lanceolate
12163 Leaves sessile oblong lanc. attenuated at base obtuse entire mucronate with a gland, Pedunc. fi if. viscid
12164 Leaves sessile obl. acute entire scabrous, Stem branched at top, Heads corymbose
12165 Leaves sessile lin. acuminate nerved smooth scattered, Stem about 1-headed
12166 Leaves linear fleshy generally 3-pointed
12167 Leaves subserrate downy beneath : radical stalked ovate, Stem erect 1-flowered
12168 Leaves lanc. hirsute entire, Stem 1-headed, Invol. short imbricated

and Miscellaneous Particulars.

a preserve with sugar. Inuleæ in many respects resemble Anthemideæ, Senecioneæ, and Nassauvieæ, especially in their style ; but they are perfectly well characterized by the peculiarities of their ovarium, pappus, stamens, and corolla. They are also related to Carlineæ. They are found in every part of the world, and especially in southern Africa ; almost all the Compositæ of the southern latitudes being referable to them.

I. Helenium, called Elecampane, from the officinal name Enula campana, is one of the largest of British herbaceous plants. It was formerly esteemed a tonic, and is still retained in the Materia Medica, though little used. Bruised and macerated in wine, with balls of ashes and whortle berries, it dyes a blue color. The young branches of I. Crithmifolia are frequently sold in the London markets for samphire, to which they bear some resemblance in appearance, but none in virtues.

History, Use, Propagation, Culture,

1745. *Pulicaria.* So named in allusion to its property of driving away fleas, *pulices.* See Conyza. P. dysenterica has its specific name from having cured certain Russian soldiers of the bloody flux. It is called by our old authors middle flea-bane, and was supposed by its smoke in burning to chase away fleas and other insects. Forskahl says, it is named in Arabic *Rara ejub*, or *Job's tears*, from a notion that Job used a decoction of this herb to cure his ulcers. Of course it was formerly recommended to cure the itch. P. vulgaris is also said to drive away fleas and gnats.

1746. *Grindelia.* A handsome genus of herbaceous plants, with neat foliage, and pretty yellow flowers. They are sometimes called Donia.

1747. *Podolepis.* From πους, a foot, and λεπις, a scale. The stalks of the flowers are covered with scales.

1748. *Chætanthera.* From χαιτα, hair, and ανθηρα, an anther, the anther being furnished with a hairy tuft.

1749. *Arnica.* This is said to be a corruption of *ptarmica*, derived from πταιρω, to sneeze. The Arnica montana is a powerful sternutatory; in the Vosges it is even called *tabac* on that account. The whole plant has important medicinal properties; it is fortifying, diuretic, emmenagogue, vulnerary, antiseptic, resolvative, and sternutatory. The root powdered is employed in diarrhœa, dysentery, and quartan fevers; it is also applied outwardly to bad ulcers, and in cases of gangrene. The flour is used in asthenia, rheumatic pains,

12169 Leaves ovate-oblong decurrent toothed entire at end, Flowers corymbose clustered
12170 Leaves sessile opp. linear lanc. entire dotted beneath, Pedunc. long 1-headed
12171 Leaves lanceolate linear entire, Corymbs branched, Rays of flowers very short

12172 Leaves amplexicaul. oblong wavy villous, Stem erect panicled, Pedunc. 1-fl. opposite the leaves
12173 Leaves oblong sessile, Pedunc. filiform, Involucre cylindrical
12174 Leaves oblongo-cordate amplexic. rugged downy, Stem woolly panicled, Scales of involucre setaceous

12175 Leaves ovate-obl. serrated, Involucres viscid
12176 Leaves sessile obl. lanceolate acute serrated at end not viscid
12177 Leaves obl. amplexicaul. serrated, Scales of involucre filiform at end revolute squarrose
12178 Stems simple, Lower leaves spatulate: upper linear-oblong serrated 1-nerved
12179 Leaves oblong blunt half-amplexicaul. ciliate serrated, Leaves of invol. linear flat bristle-pointed

12180 Scales of invol. rugose blunt, Stem quite simple
12181 Scales of invol. equal ovate acuminate, Stem nearly simple

12182 Leaves lanceolate ciliated

12183 Leaves ovate entire: cauline twin opposite
12184 Leaves toothed, Teeth acuminate: radical stalked elliptical roundish; cauline alternate oblong
12185 Leaves remotely toothed hirsute: radical stalked obl. narrowed at base; caul. alternate obl. lanceolate
12186 Scape 1-headed naked, Leaves stalked obovate repand
12187 Leaves somewhat toothed and hairy: radical stalked obl. rounded at base; caul. altern. obl. lanceolate

12188 Leaves obovate crenate smooth, Scape 1-headed

12189 Leaves cordate repando-dentate: radical ones petiolate; cauline ones amplexicaul.
12190 Leaves remotely toothletted: upper oblong amplexicaul.; lower ovate stalked, Petioles winged auricled
12191 Leaves toothletted: upper lanc. amplexicaul.; lower spatulate ovate; radical cordate stalked
12192 Leaves toothed obov. amplexic.: radical obov. spatulate narrowed into the stalk, Stem simple 1-headed
12193 Smooth, Radical leaves cordate deeply toothed; cauline oblong amplexicaul. Stem about 1-headed
12194 Downy, Lower leaves stalked ovate with winged petioles: upper amplexicaul.; all toothed

12195 Leaves stalked or ovate toothed subsinuate at base downy beneath: the old ones quite smooth

12196 The only species

12197 The only species

12198 Leaves serrated quite smooth
12199 Leaves serrated downy
12200 Lower leaves pinnatifid: upper entire smooth, Florets of disk 4-toothed
12201 Leaves lanceolate decurrent, Ray of corolla 4-parted

and Miscellaneous Particulars.

bruises, gutta serena, and paralysis of the bladder. The root is given in doses of six to twelve grains; the flowers of from three to four grains. Dr. Thomson observes, that in the hands of British practitioners it has not merited the eulogium of the French and German. (*Lond. Disp.* p. 169.)

1750. *Gerberia.* T. Gerber, a German naturalist, is only known as a traveller in Russia. A very pretty little greenhouse plant with neat purple flowers.

1751. *Doronicum.* Derived from the Arabic name *Doronigi.* *Pardalianches* is from παρδος, a tiger, and αγχειν, to strangle; on account of the use said formerly to have been made of the plant for the purpose of destroying wild animals.

1752. *Perdicium.* A name given by Pliny to a plant of which the partridge, *perdrix*, is very fond. The plant is not now recognized.

1753. *Tetragonotheca.* From τετρα, four, γωνια, an angle, and θηκη, a capsule, in allusion to the four angles of the grains.

1754. *Ximenesia.* Named by the Abbé Cavanilles, after Joseph Ximenez, a Spanish apothecary, who is said to have attended to plants.

1755. *Helenium.* Named after the celebrated Helen, who is said to have availed herself of the cosmetic properties of the plant named after her. That is believed to be the modern Inula Helenium; the ancient name being unoccupied, it has been applied to this American genus, which resembles the other.

History, Use, Propagation, Culture,

1756. *Bellis.* So called from *bellus*, pretty. Every one knows the daisy.

1757. *Bellium.* See Bellis, from which this genus differs chiefly in the pappus of the grains.

1758. *Dahlia.* Named after Andrew Dahl, a Swedish botanist, and pupil of Linnæus. Continental botanists call the genus Georgina. This genus grows in Mexico, in sandy meadows, and till the peace of 1814 was more cultivated in France than in England: at present it is one of the most fashionable hardy plants. Though its leaves are coarse, resembling those of the common dwarf elder, yet the flowers are showy, and continue in beauty till late in autumn. The plants grow freely in any soil or situation; but the poorer the ground is, the smaller the size of the plant, and the earlier and more abundant the flowers. The single-flowered varieties of D. superflua are almost without end; the double varieties of both species are much less numerous. Any number of the former may be raised from seeds, which ripen in abundance, and if sown in February on artificial heat, and transplanted in the end of April, they will flower in the July or August following. The double varieties are increased by dividing the roots, or by grafting, or by cuttings; they may also be sometimes raised from seeds. A very general way in which both kinds are propagated is by cuttings. They may be either taken from the root-shoots in spring, or the tops of the young shoots early in summer; the lower end of each cutting should be cut smoothly off in the middle of a joint, and all the leaves left on, excepting those that would be buried in planting the cutting. If planted in sandy soil, on a gentle bottom heat, and covered with a hand-glass, they will soon strike root, and produce both flowers and tubers the same autumn. The double sorts are grafted on tubers of the single varieties much in the manner of whip-grafting, but without a tongue. There must be no buds on the tuber; cut off a slice from the upper part of it, in a sloping direction, and make, at the bottom of the part so cut, a ledge, whereon to rest the graft; next, cut the scion sloping to fit, it should contain two joints, and be cut so that one of these may be at the bottom of it to rest on the ledge; from that joint the scion will occasionally put forth roots; from the other the future stem will be formed. Having tied the graft, clay it as in common grafting; then put the root in fine mould, burying half the graft, and place the pot in a gentle moist heat under a glass. If this be done in March, the plant may he shifted into a larger pot in April, and planted out in the end of May.

As the Dahlia is a bulky plant, it requires either to be grown in a very large pot, or in from three quarters to a yard and a half of surface. They look well in rows, or occurring singly in a shrubbery.

The treatment of the Dahlia bears a considerable resemblance to that of the potato and the marvel of Peru; as soon as the frost has blackened the tops of these three plants, their roots require to be taken up, and

12202 Scape naked single-headed, Leaves obovate crenate

12203 Scape naked single-headed, Leaves obovate crenate 3-nerved
12204 Stem somewhat leafy

12205 Stolones creeping, Scapes 1-headed, Leaves spatulate
12206 Stem leafy capillary

12207 Rachis of lvs. winged, Leafl. ovate acumin. serrated shining and smooth beneath, Outer invol. reflexed
12208 Rachis of lvs. naked, Leaflets ovate acuminate serrated roughish beneath, Outer invol. spreading

12209 Leaves pinnated: leaflets linear pinnatifid-toothed

12210 Leaves simple lanceolate finely serrated ciliate at base
12211 Leaves pinnated: leafl. lanc. ciliate-serrated, Pedunc. 1-headed thickened, Inv. smooth, Stem spreading
12212 Leaves pinnated: leaflets lanc. ciliate-serrated, Pedunc. 1-headed ventricose, Invol. angular, Stem erect
12213 Leaves pinnated: leafl. lanc. serrated; term. subdecurrent, Pedunc. many-fl. scaly, Flowers dense
12214 Leaves pinnated: leaflets linear serrated; lower serratures long, Stem panicled, Invol. clavate
12215 Leaves pinnated: leaflets filiform, Ray not longer than involucrum
12216 Leaves pinnated: leaflets filiform subulate entire, Stem branched diffuse, Pedunc. 1-headed solitary
12217 Leaves pinnated: lower segments lanceolate; upper linear, Serratures with intermediate glands

12218 Stem smooth, Leaves pinnated, Leaflets linear subulate entire

12219 Leaves altern. pinnate linear setaceous

12220 Leaves linear amplexicaul. ciliated at base attenuated at end
12221 Leaves linear sessile acute ciliated at base

12222 Stem filiform branched, Leaves woolly subulate filiform, Peduncles naked axillary 1-headed

and Miscellaneous Particulars.

kept in a dry place, where the frost cannot get at them till spring. About April they may be divided, and planted in the open air where they are to flower; or, what is more common planted in large pots, and forwarded in heat till the middle of May, when they may be turned out of the pots where they are finally to remain. In this case they will flower a month or six weeks earlier than by the other method, and will, in general, continue flowering till they are destroyed by frost. Some care is requisite to preserve the roots sufficiently moist and plump to maintain the living principle, and yet not to rot, shrivel, or freeze them. The safest mode is to plant them in pots or boxes of dry earth, and place them in a shed or cellar, or under an ample covering of litter thatched over.

1759. *Bœbera.* Bœber is said by Willdenow to have been a learned Russian botanist.

1760. *Tagetes.* Named after Tages, a Tuscan divinity, the son of Genius, and the grandson of Jupiter. T. patula is a tender annual, deservedly popular, from the brilliancy and variegation of its flowers: it is cultivated in Japan, China, and many parts of India, but does not appear to be indigenous of those countries. The varieties of T. erecta differ chiefly in the shades of the same color, but there are also double and quilled flowers. Both species are raised from seeds, upon a moderate hot-bed, in the beginning of April, and when they are three inches high, transplanted to where they are finally to remain. The varieties are very apt to degenerate, and can only be reproduced by the most careful selection and separation.

This genus serves for the basis of M. Cassini's Tagetineæ, which do not appear to be at all distinct from Heliantheæ, from which they differ principally in the form of their ovarium. M. Cassini's principal motive for distinguishing them as a separate race, seems to have been his wish to reduce his tribe of Heliantheæ, which he finds too extensive. Nearly all the species are found in America.

1761. *Heterospermum.* From ἕτερος, various, and σπέρμη, seed; on account of the variable shape of the grains.

1762. *Schkuhria.* Named in honour of Christian Schkuhr, an acute German botanist, who has published some of the most accurate and useful, if not splendid, botanical works which the world has seen. It is to be regretted that their rarity makes them more generally unknown than they deserve to be.

1763. *Pectis.* From *pecten*, a comb, to which the teeth of the pappus may be compared.

1764. *Longchampsia.* So named after Doctor J. L. A. Loiseleur Deslongchamps, a French botanist, author of a useful Flora Gallica, in two small duodecimo volumes, published at Paris, the first in 1806, the second in 1807.

History, Use, Propagation, Culture,

1765. *Leysera.* So called in honor of Frederick William Leyser, a German, and author of a Flora Halensis in 1783.

1766. *Selloa.* Named after Mr. Sello, a German botanist, employed by the Prussian government in collecting materials for a natural history of Brazil. An uninteresting stove perennial plant, remarkable for having florets mixed among the leaves of the involucrum.

1767. *Relhania.* In honor of the Rev. Richard Relhan, an English botanist, and author of a Flora Cantabrigiensis. The genus was named by L'Heritier. Plants of no beauty and easy culture.

1768. *Zinnia.* John Godfrey Zinn, a German, published, in 1757, a Catalogue of the Plants in the Garden of Gottingen, &c. Handsome border annuals, with persistent flowers, of the same culture as Tagetes.

1769. *Chrysanthemum.* From χρυσος, gold, and ανθος, a flower; because many of the kinds bear flowers of a yellow color. *Chrysantème*, Fr., *Goldblume*, Ger., and *Crisantero*, Ital. C. sinense is one of the handsomest of autumnal flowers, and of the easiest possible culture in any soil. It is a popular flower in China, whence all our numerous varieties have very recently been obtained, and chiefly through the exertions of the Horticultural Society. These are certainly a very great addition to the beauties of the flower garden in a dry autumn, and to the green-house or conservatory in the wet and foggy months of November and December, when scarcely any thing else is in flower. The plants are propagated by divisions, by suckers, and by cuttings;

12223 Leaves linear subulate ciliate rough, Scales of invol. lanceolate
12224 Leaves filiform downy, Scales of invol. membranous reflexed

12225 The only species

12226 Leaves oblong acuminate nerveless recurved at end
12227 Leaves linear somewhat pungent striated beneath, Heads sessile
12228 Leaves linear villous, Pedunc. lateral shorter than leaf

12229 Heads sessile, Leaves opp. cordate-lanceolate amplexicaul. sessile
12230 Heads stalked, Leaves opp. ovate-lanceolate somewhat stalked
12231 Heads stalked, Leaves whorled ovate-lanceolate stalked, Ray double
12232 Heads stalked, Leaves opp. cordate ovate sessile amplexicaul. Stem hairy, Paleæ serrated
12233 Heads stalked, Leaves opp. cordate lanceolate stalked, Ray linear-lanceolate reflexed
12234 Leaves cordate sessile rough at edge, Grains of disk with 2 awns: of the ray awnless

12235 Leaves smooth attenuated at base pinnatifid: segments cut
12236 Leaves all cuneiform oblong finely serrated, Stem simple 1-headed erect
12237 Leaves sessile: lower linear lanceolate serrated; upper spatulate
12238 Leaves amplexic. obl. obt. cut pinnatifid at base; radical ones obovate petiolate, Stem erect branched
12239 Lower leaves stalked spatulate serrate: upper lin. lanc. serrated, Stem 1-headed
12240 Leaves pinnated: pinnæ linear acute, Stem erect 1-headed
12241 Leaves linear nearly entire, Stem quite simple
12242 Lower leaves palmated: leaflets linear pinnatifid
12243 Leaves bipinnate: pinnæ oblong serrated, Heads corymbose
12244 Leaves bipinnate hoary: leaflets acute entire, Stem 1-headed simple
12245 Radical leaves 3-parted cut-toothed: cauline cuneiform 3-parted blunt
12246 Leaves bipinnated fleshy smooth, Scales of invol. keeled
12247 Leaves bipinnated linear subulate smooth, Stem erect somewhat branched
12248 Very near C. leucanthemum, but the lower leaves are more spatulate
12249 Leaves amplexic. glaucous inciso-serrate above toothed at the base
12250 Leaves lingulate blunt serrated, Scales of involucre equal
12251 Leaves bipinnate serrated, Rays length of disk, Stem procumbent
12252 Leaves bipinnatifid acute broadest externally, Stem branched
12253 Leaves flaccid stalked pinnatifid finely toothed: upper entire, Ray a little longer than flower
12254 Leaves coriaceous stalked sinuate-pinnatifid toothed glaucous, Ray very long

and Miscellaneous Particulars.

as they are very apt, in every case, to throw up suckers, the latter mode is decidedly the best. The cuttings may be taken from the side branches at any season from April to September; taken off before the end of May, they will flower the succeeding autumn; those taken off afterwards will not flower till next year. Chrysanthemums are so very prolific in suckers, that they soon become unsightly plants, and produce small and degenerate blossoms, unless frequently renewed from cuttings. The Chinese are said to do this every year; they take off the cuttings in May, strike them as we do, and then put each plant in a very small pot, in which it flowers the succeeding autumn. The plants are thus kept in a dwarf state, and clothed with green foliage from the ground to the flower. In order that the blossoms may be strong, they leave only one or two flower-buds on the summit of each plant, and they remove all suckers and side shoots till the blossom is over. This mode is now generally adopted with us; but sometimes the plants are retained a second, or even a third year, in which case care is requisite to leave no more stems, and to have no more suckers growing at one time than the roots can support in a vigorous state. As under this management the stems attain a great height, they require to be supported by a rod, and adjusted so as to form a symmetrical figure by a nice application of black threads, or small copper wires.

Sometimes the Chrysanthemum is grown in beds or borders, in which case the plants should be taken up every year and their superfluous suckers removed; or, which is better, they should be totally renewed by cuttings.

History, Use, Propagation, Culture,

Though these plants will grow in any soil, yet when in small pots they require a rich loam, and are the better for being watered, as in China, with liquid manure. The different varieties are well described by Mr. Sabine, in the fourth and fifth volumes of the Horticultural Transactions.

1770. *Pyrethrum.* An ancient Greek name, applied to this plant from its supposed resemblance to the πυρεθρον of Dioscorides. That plant is believed to have been the Anthemis pyrethrum, or Pellitory of Spain, of the moderns, and to have received its name from the burning qualities of its root; πυρ, fire. All the plant of Pyrethrum Parthenium has a strong unpleasant smell, and a bitter taste. It is used externally, in the form of lotion and of poultice, and internally as an infusion for colic, hysterical affections, and weak digestion. There are some double-flowering varieties, which are very ornamental.

1771. *Matricaria.* So named on account of the use which is made of it in disorders of females. *Matricaire,* Fr., *Mutterkraut,* Ger., and *Matricaria,* Ital. It excites menstruation. Chamomilla is an alteration of the

12255 Leaves all cuneiform oblong bluntly serrated, Stem branched diffuse
12256 Leaves stalked serrated: lower roundish; upper ovate, Stem 1-headed
12257 Leaves with very narrow segments, Petioles very short connate

12258 Leaves pinnatifid fleshy: segments linear entire, Pedunc. long corymbose
12259 Leaves trifid fleshy; segments somewhat toothed linear blunt, Pedunc. long subcorymbose
12260 Leaves bipinnatifid linear acute, Pedunc. 1-headed terminal
12261 Leaves lanceolate serrated: radical oblong, Stem 1-headed
12262 Cauline leaves lanceolate deeply toothed: radical pinnatifid, Stem 1-headed
12263 Leaves pinnatifid: segments of the lower linear lanc. entire or bifid; upper linear entire
12264 Leaves fleshy pinnatifid linear toothed: upper linear trifid
12265 Leaves pinnatifid: segments lanc. somewhat 3-toothed fleshy, Pappus unequally toothed
12266 Leaves pinnatifid: segm. lanc. deeply toothed somewhat fleshy: upper lin. toothed, Pappus uneq. toothed
12267 Leaves downy glaucous subsessile lyrate pinnatifid unequally toothed, Heads corymbose
12268 Leave pinnate powdery, Leaflets pinnatifid blunt toothed, Pedunc. corymbose, Pappus toothed
12269 Leaves woolly bipinnate, Pinnæ and pinnules obl. imbricated, Stem 1-headed, Invol. woolly
12270 Leaves bipinnate: pinnæ lin.-filiform 2 or 3-parted, Stem erect branched, Pappus 2-lobed
12271 Leaves pinnatifid: segm. lanc. finely serrated, Grains subulate, Pappus unequally toothed
12272 Leaves linear serrulate, Heads corymbose
12273 Leaves lanc.: lower serrated at end; upper entire, Branches corymbose
12274 Leaves lanc. all deeply serrated, Stem erect branched at end
12275 Lower leaves pinnatifid toothed: upper linear entire, Stem 1-headed
12276 Leaves ovate obl. serrated: radical stalked; cauline sessile auricled at base, Heads corymbose
12277 Leaves hairy subsessile pinnatifid toothed blunt, Corymb terminal compound
12278 Leaves pinnated smooth: pinnæ once or twice pinnatifid with acute diverging segments, Invol. smooth

12279 Leaves bipinnate linear silky: pinnæ crossing, Pedunc. corymbose, Ray shorter than involucre
12280 Leaves pinnated, Pinnæ lanc. pinnatifid finely serrated: upper confluent, Pedunc. corymbose
12281 Lvs. petiol. flat bipinnate the segm. ovate cut, Pedunc. branch. corymb. Stem erect, Invol. hemispherical [pubescent
12282 Leaves pinn.: pinnæ obl. obt. pinnatifid toothed; upper confluent, Stem virgate, Heads corymbose
12283 Leaves bipinnate: leaflets linear subulate, Stem 1-headed
12284 Rad. leaves bipinnate: pinnæ linear pinnatifid; cauline bipinnatifid, Heads corymbose
12285 Leaves sess. bipinnatifid with segm. capillary, Stem branched spreading, Pappus entire
12286 Leaves bipinnatifid the segm. linear fleshy awnless, Stem diffuse branched, Pappus lobed
12287 Leaves bipinnate linear blunt, Stem ascending somewhat corymbose, Ray length of invol.
12288 Leaves hoary bipinnate linear blunt, Stem simple, Pedunc. twin, Ray shorter than disk
12289 Leaves pinnatifid: pinnæ cut-toothed, Pedunc. long nearly naked 1-headed, Scales of invol. blunt

12290 Leaves triply pinnate, Scales of invol. acute
12291 Leaves glabrous bipinnatifid the segments capillary, Invol. nearly plane: its scales obtuse
12292 Leaves glabrous bipinnatifid: stem branched suffruticose
12293 Leaves pinn. somewhat fleshy, Pinnæ linear blunt, Scales of invol. blunt, Grains margined on one side

12294 Leaves all entire
12295 Lower leaves serrated

12296 Leaves pinnatifid glaucous beneath
12297 Leaves stalked 5-lobed

12298 Ray short white: red on the lower surface

12299 Leaves pinnate multifid dilated, Ray none
12300 Leaves lanc. lin. amplexicaul. pinnatifid toothed, Stem procumbent, Branches 1-headed

and Miscellaneous Particulars.

Greek χαμαι μηλον, a dwarf-apple, which Pliny informs us was applied to the plant, on account of its smelling of apples, or rather quinces. It is remarkable, that the Spaniards call it *mancinilla*, which also means a little apple. The chamomile of medicine is another plant. See Anthemis.

M. Chamomilla is supposed to possess the same qualities with the officinal chamomile (Anthemis nobilis), but in an inferior degree. Most of the species, and chiefly this one, are rejected by quadrupeds.

1772. *Boltonia.* Named after I. B. Bolton, an English botanist, who wrote a work upon the Ferns of Great Britain, and another upon the fungi growing about Halifax, published in 1788-9.

1773. *Lidbeckia.* E. G. Lidbeck, a German botanist, published some works upon agricultural matters.

1774. *Cenia.* From κενος, empty, in allusion to its inflated calyx.

1775. *Cotula.* A diminutive of Cota, an old name for some species of Anthemis, which this resembles in miniature.

History, Use, Propagation, Culture,

1776. *Grangea.* A genus of Adanson's. The meaning of the word is unknown.

1777. *Anacyclus.* An abridgement of *Ananthocyclus*, which was the name originally proposed by Vaillant, and which does not appear to have been altered for the better. He formed it from α, privative, ανθος, a flower, and κυκλος, a circle; on account of the rows of ovaries without flowers, which are placed in a circle round the disk.

1778. *Anthemis.* From ανθος, a flower, on account of the multitude of flowers with which the plants are covered. A. nobilis is in considerable repute, both in the popular and scientific Materia Medica. The flowers, which are the parts used, have a strong and fragrant smell, and a bitter aromatic taste; both are extracted by water and alcohol. The active principles appear to be bitter extractive, resin, and essential oil. Medicinally, the flowers are considered tonic, carminative, and slightly anodyne: yet when a strong infusion of them is taken in a tepid state, it proves powerfully emetic. Given in substance, united with opium and astringents, if the bowels be easily affected, they have been successfully used for the cure of intermittents; and the infusion, in combination with ginger, or other aromatics, and the alkalies, is an excellent stomachic in dyspepsia, chlorosis, gout, flatulent cholic, and chronic debility of the intestinal canal. The tepid strong infusion is a ready emetic, and is often employed to promote the operation of other emetics. By coction in water, the essential oil is

12301 Leaves lyrate pinnated, Flowers radiant
12302 Leaves tripinnate: segment acute, Stem erect, Heads flosculose corymbose
12303 Stem hirsute, Leaves lyrate pinnatifid hairy, Heads terminal hemispherical

12304 Leaves cuneiform smooth 3-toothed stalked, Heads axill. sessile
12305 Leaves obl. cuneate repand-toothed stalked, Heads axill. sessile
12306 Leaves obl. sinuate toothed downy, Stem branched procumbent, Pedunc. 1-headed opp. the leaves
12307 Leaves obovate toothed cut at base stalked, Peduncles branched

12308 Leaves bipinnate, Leaflets oblong, Stem procumbent
12309 Leaves bipinnate, Leaflets linear subulate flat, Stem ascending, Peduncle naked terminal
12310 Leaves bipinnate roundish hoary with excavated dots
12311 Leaves decompound linear: segm. divided roundish acute, Heads flosculose
12312 Leaves 3-pinnate, Pinn. linear-subulate downy, Stem branched divaricating, Pedunc. thick

12313 Leaves bipinnate linear, Pedunc. inflated, Grains winged

12314 Leaves bipinnatifid: segm. somewhat toothed rigid, Paleæ oblong acuminate
12315 Leaves bipinnatifid: segm. lin. subulate toothed, Palcæ round pungent dilated at base
12316 Leaves bipinnatifid: segm. lanc. somewhat toothed; lower teeth reflexed, Paleæ lanc. cuspidate
12317 Leaves bipinnatifid dotted beneath: segm. lanc. entire, Grains naked, Stem herbaceous
12318 Snow-white, Leaves pinnate: pinnæ 3 or 5-fid, Invol. downy, Stem erect
12319 Leaves bipinnate: pinnæ linear, Stem erect and invol. downy, Inner scales sphacelate at end
12320 Leaves sessile pinnatifid: segments toothed, Stem erect branched
12321 Leaves pinnate: pinnæ linear entire subpubescent, Floral leaves simple, Branches 1-headed
12322 Rad. leaves bipinnatifid toothed: cauline pinnatifid somewhat toothed
12323 Leaves bipinnatifid stalked: segm. trifid oblong acute, Petioles sheathing, Sheaths toothed
12324 Lvs. bipinn. the segm. lin. subul. a little downy, Scales of recept. membranous scarcely long. than the disk [entire pappus
12325 Lvs. bipinnatif. their segments lin. lanc. pubesc. Recept. conical its scales lanc. Pericarps crowned with an
12326 Recept. conical: paleæ obl. mucronate, Grains naked, Leaves bipinnate woolly
12327 Leaves bipinnatif. glabrous their segm. subul. Receptacle conical its scales setaceous, Pappus O.
12328 Recept. subconical, Paleæ obl. blunt, Grains naked, Lvs. bipinnate linear filiform 3-parted
12329 Leaves pinnated downy: pinnæ linear trifid bluntish, Stem ascending, Pedunc. long naked downy
12330 Leaves 3-pinnate: leaflets linear, Stem decumbent, Branches axillary 1-headed
12331 Leaves hairy bipinnatifid: segments trifid lanc. linear, Stem nearly erect divided
12332 Leaves bipinnatifid serrated downy beneath, Stem erect branched subcorymbose
12333 Leaves bipinnate serrated smooth, Stem erect branched, Pappus membranous toothed cut on one side
12334 Leaves pinnated: pinnæ linear 3-parted, Stem proliferous, Heads solitary axillary sessile
12335 Leaves smooth pinnatifid: lobes cuneate trifid or cut, Heads solitary
12336 Leaves bipinnatifid dotted beneath: segments entire, Crown of grains toothed
12337 Leaves woolly bipinnate: pinnæ lanc. acute, Flowering branches corymbose, Recept. conical
12338 Leaves stalked silky bipinnate: segm. linear acute, Invol. downy, Rays ovate
12339 Leaves linear sessile pinnatifid: segm. entire, Stem erect branched
12340 Leaves sessile pinnatifid: segm. linear subulate pectinate entire, Stem downy 1-headed
12341 Leaves pinnated: pinnæ linear entire blunt, Stem downy 1-headed [edge
12342 Leaves pinnated revolute at edge: segm. lin. subul. subtrifid, Upper scales of invol. blunt with a membran.

12343 The only species, resembling a Calendula

12344 Stem procumbent, Leaves ovate entire

and Miscellaneous Particulars.

dissipated: chamomile flowers, therefore, ought never to be ordered in decoctions. Externally, they are used as fomentations in cholic, intestinal inflammation, and to phagedenic ulcers: and their infusion is also found to be an useful addition to emollient anodyne glysters in flatulent cholic, and in irritations of the rectum producing tenesmus. (*London Disp.* p. 158.) There is a double variety generally grown for the apothecaries; it is more ornamental than the single, but much less efficacious as a medicine.

A. cotula is said by Linnæus to be a very grateful plant to toads; to drive away fleas, and to annoy bees. It is a very common weed on soft rich soils and dunghills, and increases by seeds with amazing rapidity. The tribe of Anthemideæ, of which this genus is the example, are nearly related to Heliantheæ. In their style they resemble Inuleæ, Senecioneæ, and Nassauvieæ, but their floral organs are different. They inhabit Europe, Asia, and Africa, scarcely one has been found in America, or the southern parts of the world.

1779. *Centrospermum.* From κεντρον, a spur, and σπερμη, a seed, in allusion to the spiny points of the pappus. A small annual plant with the aspect of Calendula.

1780. *Sanvitalia.* Named by Lamarck without any explanation. A hardy annual plant, with flowers having a yellow ray and dark purple disk, like some species of Rudbeckia.

1781. ACHILLE'A. *W.* Milfoil. *Compositæ. Sp.* 50—69.

History, Use, Propagation, Culture,

1781. *Achillea.* Named after Achilles, a disciple of Chiron, and the first physician who used it in healing wounds. A. Ptarmica is called sneeze-wort, because the dried powder of the leaves snuffed up the nostrils provokes sneezing. In the spring, the young tender shoots were formerly put into salads, to correct the coldness of other herbs. There is a variety with double flowers, which is very ornamental, especially in pots. A. moschata, the *Genipi* of the Swiss, is an excellent sudoritic, aromatic, and acrid, and is a grateful food to cattle.

12345 Leaves obl. linear blunt doubly serrulated downy ciliated, Stem villous
12346 Leaves linear narrowed at base serrated and stem smooth [at end
12347 Leaves lin. acute equally and finely serrulate smooth, Stem panicled, Corymbs few-headed, Paleæ bifid
12348 Leaves linear lanc. acuminate sharply serrated

12349 Leaves lin. plane acuminate toothed : teeth emarginate transversely ciliated, Stem diffuse
12350 Leaves obl. blunt serrated narrowed into the petiole fascicled glabrous, Corymb compound contracted
12351 Leaves linear acuminate equally and finely serrated smooth : serratures of the base deepest, Paleæ entire
12352 Leaves lanc. equally and finely serrated downy, Serratures of base deepest, Stem panicled, Paleæ entire
12353 Leaves linear pectinate pinnatifid glabrous : segm. subserrated, Corymb compound
12354 Leaves downy linear lanc. pinnatifid : segments deepest at base
12355 Leaves downy pinnatifid smooth : segm. linear blunt : upper toothed at end, Corymb simple
12356 Leaves pectinate pinnatifid smooth : segm. linear acute ; lower 2-parted, Corymb simple
12357 Leaves pectinate pinnatifid : segm. linear subulate entire, Corymb compound contracted, Stem downy

12358 Leaves pinnatifid : segm. obl. cuneate unequally toothed vertically bent, Corymbs simple
12359 Leaves pinnated roundish pilose : pinnæ 3-parted toothed imbricated across, Corymbs simple
12360 Leaves pinnat. somew. downy, Pinnæ 3-part. blunt entire transversely imbr. Ray scarcely long. than invol.
12361 Leaves pinnated somewhat downy, Pinnæ 3-parted transverse distant : segm. 3-toothed, Stem branched
12362 Leaves pinnated downy : pinnæ linear entire blunt ; lowest longest, Cymes simple
12363 Leaves pectinate pinnate smooth : pinnæ linear acuminate usually 3-parted
12364 Leaves linear-lanc. acuminate unequally and finely biserrate villous beneath
12365 Leaves downy pinnatifid : segm. lanc. serrated, Corymb compound
12366 Stem downy, Leaves pinnated minutely cut acute rigid bent upwards with a downy nerve
12367 Leaves pinnated : pinnæ long distant very narrow linear entire, Corymb compact branched
12368 Cauline lvs. pinnatifid with entire segm. : radic. pinnatifid with 3-fid segm. Ray scarcely larger than invol.
12369 Leaves pectinate pinnate smooth, Pinnæ linear bluntish entire dotted
12370 Leaves pinn. villous : pinnæ toothed linear ; radical bipinnate, Stem quite simple
12371 Leaves pinn. downy : pinnæ roundish 4-fid concave spreading, Stem branched at end
12372 Leaves pinn. downy : pinnæ roundish bluntly toothed, Corymb compound
12373 Leaves pinn. smooth : pinnæ lanc. cut-serrated ; outer confluent, Corymb compound
12374 Leaves bipinnate downy : pinnæ linear-lanc. toothed, Corymb simple, Peduncles long
12375 Leaves bipinnatifid hoary : segm. lin. lanc. serrated, Corymb compound globose, Flowers flosculous
12376 Leaves bipinnatif. setaceous villous : segm. lanc. entire, Corymb compound contracted, Flowers flosculous
12377 Leaves bipinnatifid pubescent : segm. linear lanc. unequal acute, Corymb compound
12378 Leaves downy : cauline bipinnatifid with linear blunt segm. ; radical bipinnate, Corymbs compound
12379 Leaves bipinnatifid : segm. lanc. serrated, Corymb compound spreading
12380 Leaves bipinnatifid : segm. lanc. cut-serrated, Rachis winged cut-serrated, Corymbs fastigiate compound
12381 Leaves bipinnatifid villous : segm. lanc. blunt, Corymbs fastigiate compound
12382 Leaves thrice pinnatifid : segm. lanc. acute, Corymbs compound fastigiate
12383 Leaves bipinnate slightly hairy their segm. linear toothed acute, Stems furrowed

12384 Leaves pinnatifid downy beneath : segm. toothed, Stem branched fastigiate smooth
12385 Leaves bipinnatifid downy : segm. lanc. entire, Corymb compound
12386 Leaves bipinnatifid woolly : the segm. crowded linear acute, Corymbs repeatedly compound
12387 Leaves subbipinnatifid : pinnæ of the base undivided : segm. lin. lanc. Corymb compound, Invol. cylindr.
12388 Leaves bipinnatifid shorter than the intervals between them : segm. lin. entire, Corymbs comp. fastigiate
12389 Leaves bipinnatifid : segm. lin. finely serrated, Rachis winged entire, Corymb compound fastigiate
12390 Cauline leaves bipinnatifid : segm. lin. somew. toothed, Rachis winged toothed : radical thrice pinnatifid
12391 Leaves bipinnate downy : pinnæ pinnatifid, Segments linear-subulate, Corymbs compound fastigiate
12392 Leaves bipinnate pilose beneath : pinnæ linear entire, Corymb simple
12393 Leaves bipinnate : leaflets linear setaceous mucronate very compact pilose, Corymbs compound fastigiate
12394 Leaves bipinnate downy : pinnulæ very fine linear entire distant, Corymbs compound fastigiate

12395 The only species

12396 Leaves hoary linear lanc. opposite : those of the branches alternate
12397 Very villous, Leaves sessile oblong acuminate entire, Heads axillary on short stalks
12398 Hoary, Lvs. bipinnatifid cut-toothed, Segm. linear rigid mucronate, Heads lateral and terminal clustered

and Miscellaneous Particulars.

1782. *Tridax.* From τριδαξνος, cut into three pieces. The rays of the flower are divided in three.
1783. *Amellus.* A name used by Virgil for a beautiful flower growing on the banks of the river *Mella.* The plant of Virgil is supposed to have been Aster Amellus.

History, Use, Propagation, Culture,

1784. *Starkea.* Named by Willdenow, after the Rev. Mr. Starke, of Gros Tchirna, in Silesia, who paid much attention to the Cryptogamous plants of that country. This genus was included by Linnæus in Amellus, from which Willdenow remarks that it differs in habit, and in its hairy receptacle.

1785. *Columellia.* So called by Jacquin, after the celebrated Geoponic writer, Lucius Junius Moderatus Columella, a Spaniard, born forty-two years before Christ. A plant resembling Amellus annua. The flowers are yellow and sessile in the dichotomies of the branches. The Columellia of Loureiro is a different thing.

1786. *Eclipta.* A translation of the Malay name *Wangi-wangi-maihg*, which signifies an eclipse of the sun, to which the form and disposition of the radiated flower has been likened. Worthless weeds with white flowers.

1787. *Meyera.* Named after Gottlieb-Andrew Meyer, a German, who published, in 1694, a dissertation upon the Sycomorus of Scripture.

1788. *Chrysanthellum.* A diminutive of Chrysanthemum, which see.

1789. *Siegesbeckia.* Dr. John George Siegesbeck, a German physician, director of the garden at St. Petersburgh, published in 1736, a catalogue of it under the title of Flora of St. Petersburgh. There was also a Botanosophia from his pen in 1737.

12399 Leaves opp. 3-nerved downy beneath, Heads in umbels

12400 The only species

12401 Stem erect strigose, Leaves oblong lanc. sessile remotely serrated
12402 Stem prostrate strigose, Leaves obl. lanc. somewhat stalked subserrate somewhat wavy scabrous

12403 Stem erect, Leaves amplexicaul. ovate toothed

12404 Leaves alternate 3-parted toothed: radical oblong serrated, Stem creeping

12405 Leaves stalked ov. unequally toothed subtriangular at base somewhat cut, Outer invol. longer than inner
12406 Leaves sessile ovate toothed, Florets of disk 3-toothed triandrous

12407 Leaves alternate decurrent wavy blunt
12408 Leaves alternate lanc. subserrate, Corymb compound
12409 Leaves alternate deeply pinnatifid, Stem shrubby
12410 Leaves opposite ovate lanc. serrated acuminate at each end decurrent
12411 Stem winged, Lvs. lanc. acuminate somewhat stalked serrated, Heads corymbose, Cor. of ray lanceolate

12412 Leaves opposite ovate-lanc. serrated downy beneath
12413 Leaves opposite cordate-lanc. amplexicaul. remotely serrated, Invol. simple 5-leaved
12414 Leaves opposite obl. lanc. bluntish strigose serrated at end, Pedunc. 1-headed long, Invol. simple
12415 Leaves opposite ov. acuminate serrated 3-nerved hairy, Pedunc. winged 1-headed, Invol. simple
12416 Leaves opposite ov. acuminate serrated 3-nerved scabrous on each side, Pedunc. 1-headed axillary

12417 Leaves opposite ov. serrated 3-nerved, Heads axillary subsessile, Invol. simple, Stem trichotomous

12418 Leaves ovate 3-nerved serrated
12419 Leaves oblong lanceolate toothed 3-nerved: lower hastate 3-lobed

12420 Stem procumbent downy, Lvs. ovate entire, Pedunc. lateral, Ray shorter than disk

12421 Leaves ovate serrated 3-nerved downy beneath, Ray many-flowered

12422 Leaves ternate 3-lobed: lower opposite, Stem suffrutescent

12423 The only species

12424 Leaves opposite ovate serrated 3-nerved, Invol. leafy, Stem herbaceous

12425 Leaves opposite obovate hoary, Petioles with 2 teeth
12426 Leaves opposite lanceolate narrowed at base not toothed smooth

and Miscellaneous Particulars.

1790. *Verbesina.* A name with the same meaning as Verbena, which see. The V. alata resembles Vervain in the appearance of its foliage.

1791. *Synedrella.* A name of unknown meaning. A little worthless weed.

1792. *Galinsogea.* Named after after Mar. Ma. Galinsoga, first physician to the queen of Spain, and intendant of the garden of Madrid. One of the species, G. trilobata, is sometimes cultivated as a hardy annual. But it does not possess much merit.

1793. *Acmella.* From ακμη, a point, on account of the pricking taste of the foliage.

1794. *Zaluzania.* Apparently an alteration of Zaluzianskia, a name applied in error to Marsilea trifolia, and formed in honor of an obscure Polish botanist.

1795. *Pascalia.* A genus dedicated by Ortega to Didan Pascal, doctor of medicine, and a professor at Parma.

1796. *Heliopsis.* A name with the same meaning, and a genus with the same habit, as Helianthus, which see.

1797. *Buphthalmum.* From βυς, an ox, and οφθαλμος, an eye, in allusion to the broad open disk of the flowers. It is believed that the Buphthalmum of Pliny is a species of Anthemis.

History, Use, Propagation, Culture,

1798. *Helianthus.* From ηλιος, the sun, and ανθος, a flower. Nothing can be a more complete ideal representative of the sun, than the gigantic sun-flower, with its golden rays; it is dedicated with great propriety to the sun, which it never ceases to adore while the earth is illuminated by his light. When he sinks into the west, the flowers of Helianthus are turned towards him; and when he rises in the east, the flowers are again ready to be cherished by the first influence of his beams.

H. annuus is a well known border annual, which will grow in any soil. There are varieties with double flowers, the tubular florets being changed into ligular ones, like those in the ray. The whole plant, and particularly the flower, exudes a thin pellucid odorous resin, resembling venice turpentine. From the seeds an edible oil has been expressed, and they are also excellent food for domestic poultry. The flowers turning with the sun, is by some considered a popular error; Gerarde says he never could observe it; and Professor Martin has seen four flowers on the same stem pointing to the four cardinal points. H. tuberosus, *Topinambour*, Fr., *Erdapfel*, Ger., and *Girasole*, Ital., is called Jerusalem, from the corruption of the Italian word *Girasole*; and Artichoke, from the resemblance in flavor which the tubers have to the bottoms of artichokes. These tubers are in considerable esteem on the continent as a substitute for potatoes; and before the introduction of that vegetable, they were a good deal in use in this country. Their culture and treatment is the same as for that vegetable. H. multiflorus a showy autumnal flower.

12427 Leaves opposite close spatulate oblong silky, Scales of invol. setaceous hirsute
12428 Leaves alternate obl. lanc. amplexicaul. entire hirsute, Involl. leafy mucronate
12429 Involl. bluntly leafy sessile axillary, Leaves oblong blunt alternate nearly entire, Stem dichotomous
12430 Involl. bluntly leafy stalked, Lvs. alternate spatulate, Stem herbaceous
12431 Leaves alternate obl.-lanc. subserrated 3-nerved villous, Involl. naked, Stem herbaceous
12432 Leaves alternate lanc. somewhat toothletted smooth, Involl. naked, Stem herbaceous
12433 Leaves alternate: lower stalked cordate doubly serrated: upper sess. ovate serrated, Stems herbaceous

FRUSTRANEA.

12434 Leaves all cordate 3-nerved, Pedunc. thick, Heads cernuous
12435 Leaves all cordate 3-nerved, Pedunc. evensized, Involl. leafy
12436 Leaves cordate cuneate at base villous 3-nerved, Pedunc. thick fistular
12437 Leaves ovate acuminate narrowed at base unequally serrate scabrous, Pedunc. filiform, Rays obovate
12438 Leaves 3-nerved scabrous: lower cordate; upper ovate, Ray many-fl. Scales of invol. lanceolate

12439 Leaves 3-nerved scabrous: lower cordate-ovate; upper ovate acum. alternate, Petioles ciliated at base
12440 Stems slender about 1-headed, Leaves linear revolute at edge rough
12441 Leaves ovate acuminate 3-nerved serrated scabrous above hoary beneath, Invol. squarrose
12442 Leaves ovate acuminate 3-nerved closely serrated scabrous above: hoary and soft beneath
12443 Lvs. ov. acum. remotely serrat. 3-nerv. scabr. Scales of invol. lanc. nearly equal subciliated, Rays 10 or 12
12444 Lvs. lanc. acuminate scabr. serrated 3-nerved: upper entire, Scales of invol. lanc. ciliated, Stem procumb.
12445 Lvs. ovate acuminate serrated 3-nerved scabrous beneath, Scales of invol. lin. lanc. ciliated at base
12446 Lvs. altern. lanc. serr. scabr. 3-nerved narrow. at end stalked, Petioles ciliated, Scales of invol. lanc. ciliat.
12447 Lvs. altern. lanc. serr. scabr. obsol. 3-nerv. narrow. at each end subsess. ciliat. at base, Scales of inv. lanc. cil.
12448 Smooth, Stem panicled, Branches few-flowered at top, Lvs. sessile very long entire: lower serrated
12449 Stem hispid spreading, Leaves ovate rigid scabrous, Peduncles very long 1-flowered
12450 Leaves altern. or opp. sessile linear revolute at edge entire 1-nerved, Heads corymbose
12451 Leaves ov. lanc. acuminate serrated 3-nerved very rough on each side, Scales of invol. lin. lanc. ciliated
12452 Leaves altern. lanc. serrated scabrous 3-nerved narrowed at each end woolly at base, Stem vill. in 2 rows
12453 Leaves amplexicaul. Heads on long stalks, Disk of head dark purple
12454 Stem erect hairy, Lvs. stalked 3-lobed very rough, Invol. hairy, Pappus with 2 setæ
12455 Stem smooth much branched, Lvs. opp. sessile lanc. ovate 3-nerved, Panicle trichotomous slender few-fl.
12456 Leaves subsess. cordate ovate 3-nerved amplexicaul. closely serrated downy, Scales of invol. lanc. villous
12457 Leaves opp. spatulate crenate 3-nerved scabrous, Scales of invol. erect the length of disk

12458 Leaves oblong-lanceolate subserrate, Heads 1-3, Ray 8-flowered

[hispid
12459 Lvs. all pinnat.: one or other of the lower pinnæ 2-parted; the rest undivided, Pappus ent. Stem furrowed
12460 Rad. lvs. pinn.: leaflets sessile lanc. toothed somewhat cut; upper confluent, Pappus entire
12461 Rad. lvs. pinn.: leaflets ovate unequal at base about 3-lobed toothed, Pappus 4-toothed
12462 Stem upright simple few-fl. at top, Leaves pinnatifid cut: segm. linear, Invol. simple 5-leaved
12463 Stem branched, Branches erect many-fl. Lvs. obl. lanc. acute serrated: lower 3-lobed
12464 Leaves spatulate: lower 3-lobed; upper undivided
12465 Leaves undivided spatulate ovate 3-nerved serrated hairy, Recept. conical, Paleæ lanceolate
12466 Leaves obl. lanc. toothletted hispid narrowed at base subcordate, Recept. hemispherical, Paleæ lanceolate
12467 Quite smooth, Peduncles long 1-headed, Lvs. ovate-lanc. acuminate each way 3-nerved
12468 Leaves obl. lanc. cordate amplexicaul.: lower serrated, Disk cylindrical conical
12469 Leaves lanc. ovate alternate undivided, Rays bifid
12470 Stem hispid, Lower leaves broad-ovate tapered at base remotely toothed very rough, Rays 3-toothed

and Miscellaneous Particulars.

This genus has given rise to a most important and extensive tribe of plants, the Heliantheæ, which is at once the most numerous of the various tribes of Compositæ, and on account of its strict affinity with several others, the most difficult to characterize with precision. Although it is perfectly natural, yet there is scarcely a character belonging to it which is not subject to many exceptions, and to more or less important modifications. Almost all the species of Heliantheæ are natives of America, several of Asia, a few of Africa, and scarcely any of Europe. They appear to be entirely unknown in the southern parts of the world.

1799. *Gymnolomia.* From γυμνος, naked, and λωμα, an edge; in allusion to the nature of the margin of the grains.

1800. *Rudbeckia.* Named after the famous Olaus Rudbeck, professor of botany at Upsal, who died of grief in 1702, at witnessing the destruction by fire of his laborious work, called *Campi Elysii*, which was nevertheless published in 1701 and 2, by the diligence of his son. He is also celebrated for having made the discovery that the Paradise of Scripture was situated somewhere in Sweden. Handsome border annuals or perennials. R. purpurea is remarkable for bearing purple flowers.

History, Use, Propagation, Culture,

1801. *Galardia.* Fougeroux de Bondaroy, the nephew of Duhamel, dedicated this genus to M. Gaillard de Charentonneau, an amateur of botany.

1802. *Tithonia.* A fanciful name given to this plant by Desfontaines, because of the color of its flower, which resembles Yellow Morning, or Aurora, whose husband was Tithonus.

1803. *Cosmea.* From κοσμος, beautiful, on account of the elegance of the foliage.

1804. *Coreopsis.* From κορις, a bug, and οψις, resemblance. Its seed is convex on one side, and concave on the other; it has a membranous margin, and it has two little horns at the end which gives it very much the appearance of some insect. · C. verticillata is a handsome shrubbery plant, continuing long in flower; the florets are used in North America, to dye cloth red. C. tinctoria is a very handsome border annual.

1805. *Simsia.* Named by Persoon, after Dr. John Sims, the co-editor with Mr. König, of the excellent Annals of Botany, and for many years the sole editor of the Botanical Magazine.

12471 Stem branched, Leaves lanc. Paleæ of pappus entire awned

12472 The only species

12473 Leaves pinnate and bipinnatifid, Pinnæ serrated somewhat decurrent, Ray few-flowered neuter
12474 Leaves bipinnatifid: segm. lanc. Segm. of exterior invol. lanceolate
12475 Leaves bipinnate, Leaflets linear subulate, Scales of outer invol. ovate
12476 Leaves bipinnate, Leaflets filiform, Scales of outer invol. lanceolate

12477 Leaves bipinn. Pinnules lin. lanc. not broader than their rib
12478 Leaves whorled 3 or 5-pinnated: pinnæ lin. 3-parted and undivided, Disk discolored
12479 Leaves whorled 3 or 5-pinnated: pinnæ lin. 3-parted and undivided, Disk same color as ray
12480 Leaves ternate ovate-obl. serrated, Ray same color as disk
12481 Leaves serrated: radical 3-parted: cauline trifid or entire lanc. linear
12482 Leaves entire: radical pinnated; cauline in threes lanc. stalked
12483 Leaves entire ternate sessile
12484 Leaves subternate cuneate serrated
12485 Villous, Leaves stalked quinate and ternate: leaflets ovate-lanc. subpinnatifid or cut serrated
12486 Leaves serrated ovate: upper ternate, Stem creeping
12487 Leaves lanceolate entire ciliated
12488 Rad. leaves pinnate or bipinnate entire, Outer leaves of involucre short, Ray discolored at base
12489 Leaves entire ovate: lower ternate
12490 Leaves ovate acuminate crenate toothed, Grains naked
12491 Leaves stalked lanc. ovate by degrees acuminate finely serrated, Corymbs dichotomous term. and axillary
12492 Leaves obovate oblong entire downy
12493 Leaves alternate lin. lanc. entire smooth, Ray oblong trifid: middle segm. largest
12494 Stem winged, Leaves alternate scabrous roundish ovate cuneate at base 3-nerved
12495 Leaves ellipt. acuminate serrated stalked veiny decurrent: lower whorled; upper alternate

12496 Leaves 3-lobed toothed roughish, Petiole naked at base
12497 Hoary, Leaves somewhat palmate 3-lobed, Petiole leafy at base amplexicaul.

12498 Leaves lanc. obsoletely serrated toothed at base smooth
12499 Leaves obovate toothed villous

12500 Cor. of ray 4-fid nearly equal to disk, Leaves hoary with down

12501 The only species

12502 Leaves ovate smooth imbricated at the edge and rib ciliate-spiny, Spine of the end reflexed
12503 Leaves alternate obl. recurved smooth ciliate-spiny, Leaves of invol. ciliated
12504 Leaves altern. lanc. subulate recurved smoothish ciliat. spiny decurr. at base, Segm. of invol. ciliate spiny

12505 Cauline leaves altern. amplexicaul. ciliate spiny: radical entire unarmed, Scales of invol. entire
12506 Leaves opp. obl. lanc. narrowed at base spiny-toothed smooth, Scales of invol. ciliate spiny
12507 Leaves altern. ovate spiny-toothed 3-nerved netted hoary villous, Scales of invol. toothed spiny villous
12508 Leaves altern. obl. cuneiform spiny-toothed villous on each side, Scales of invol. toothed spiny
12509 Leaves altern. lanc. pinnatifid downy beneath: segm. entire spiny at end, Scales of invol. 3 or 5-fid
12510 Leaves opp. lanc. 3-nerved spiny-toothed downy beneath, Scales of invol. spiny-toothed [toothed
12511 Leaves altern. lanc. spiny-toothed downy beneath, Stem herbaceous 1-headed, Scales of invol. lanc. spiny-
12512 Leaves altern. lanc. amplexicaul. spiny-toothed ciliated smooth on each side, Heads cernuous

12513 Leaves altern. lanceolate oblong fleshy
12514 Leaves opp. somewhat amplexicaul. ovate

and Miscellaneous Particulars.

1806. *Osmites.* From *οσμη*, perfume. One of the species gives out a strong smell of Camphor.
1807. *Encelia.* A name of Adanson's, the meaning of which is unknown. A pretty half shrubby plant, with grey soft leaves.
1808. *Sclerocarpus.* From *σκληρος*, hard, and *καρπος*, fruit, with reference to the bony covering of the grain.
1809. *Cullumia.* Named after Sir Thomas Cullum, an English baronet, and one of the earliest promoters of the principles of Linnæus in this country. He is still living, at a very advanced age.
1810. *Berckheya.* Named after John Lefranc de Berckhey, a Dutch botanist.
1811. *Didelta.* From *δις*, double, and *δελτα*, a Greek letter equivalent to the English D; because the receptacle resembles a double triangle.

History, Use, Propagation, Culture,

1812. *Gorteria.* Named after David Gorter, a Dutchman, professor of botany at Harderwych, and afterwards physician to Elizabeth, Empress of Russia. He published a Flora Belgica in 1767, and assisted Kraschenninikoff in his Flora Ingrica G. Rigens is a very showy plant when the flowers are fully expanded. All the species are of easy culture.

1813. *Gazania.* Supposed to have been so called from γαζα, riches, in allusion to the splendour of the flowers.

1814. *Cryptostemma.* From κρυπτον, concealed, and στεμμα, a crown; the scaly crown of the grains being involved in wool. Tender annuals, natives of the Cape of Good Hope.

1815. *Arctotheca.* See Arctotis, from which this has been divided.

1816. *Sphenogyne.* So called from σφην, a wedge, and γυνη, a female, in allusion to the wedge-shaped stigmas. Pretty annual flowers.

1817. *Zoegea.* Named after Dr. J. Zoega, who published a Flora Islandica in 1775. *Leptaurea* is an abbreviation of *Lepto-centaurea*, small centaurea.

1818. *Leuzea.* Divided by M. Decandolle, from Centaurea, from which it differs in not having the outer florets barren, nor the pappus with simple hair, nor the insertion of the fruit oblique. He named it after his friend Deleuze.

12515 Leaves lanc. entire and sinuated, Stem erect, Flowers stalked

12516 Leaves lanc. spatulate and pinnatifid entire white with down beneath, Pedunc. 1-headed terminal
12517 Stem shrubby decumbent, Leaves spatulate-lanceolate downy beneath, Ray same color as disk
12518 Leaves pinnatifid hairy above downy beneath : segm. oval-lanc. Scape 1-headed, Stem decumbent
12519 Stem leafy decumbent 1-headed, Leaves subulate linear revolute at edge downy beneath

12520 Ligulæ undivided, Leaves pinnatifid toothed downy beneath
12521 Ligulæ 3-5-parted, Leaves lyrate downy
12522 Ligulæ 3-5-parted, Leaves runcinate toothed downy beneath

12523 The only species

12524 Smooth, Lvs. bipinnatifid or pinnatifid linear-filiform, Lvs. of pappus white
12525 Smooth, Lvs. pinnatifid linear filiform, Outer leaflets of invol. subulate
12526 Leaves bipinnatifid or pinnatifid linear filiform smooth, Scales of invol. scarious blunt shining
12527 Leaves bitripinnatifid and invol. downy
12528 Leaves pinnatifid smoothish : segm. 2-3-toothed, Teeth piliferous, Outer scales of invol. lanceolate
12529 Leaves flat smooth cut pinnatifid at end, Outer lvs. of invol. scarious at end, Pappus obsolete
12530 Leaves fleshy linear pinnatifid and bipinnatifid, Pappus much shorter than the florets of disk

12531 The radical and lower cauline leaves pinnatifid

12532 Leaves tomentose : root ones lanceolate ; stem ones pinnatifid, Stem simple
12533 Flower very large

§ 1. CYANUS. *Involucrum ciliated, unarmed.*

* *Involucrum with feathery setæ.*

12534 Inv. recurved-feathery, Leaves oblong undivided scabrous mucronate serrulated
12535 Inv. recurved-feathery top-shaped, Leaves oblong undivided scabrous mucronate serrulated, Stem simple
12536 Invol. recurved feathery, Leaves mucronate-serrated : lower stem ones sinuate pinnatifid
12537 Invol. recurv. feathery, Lvs. egg-shap.undivid. scabr. gross. tooth. : upp. ones and those of branches undivid.
12538 Invol. recurved feathery, Leaves lanceolate sometimes toothed downy
12539 Invol. recurved feathery, Head without a neutral ray, Leaves hairy lanceolate remotely toothed
12540 Invol. recurved feathery, Leaves ovate lanceolate toothed at base nerved downy, Corollas flosculous
12541 Invol. recurved feathery pubescent, Leaves linear-lanceolate quite entire scabrous
12542 Invol. erect feathery, Lower lvs. lanc. attenuat. into the petiole serrul. ; caul. ov.-obl. downy on each side
12543 Invol. recurved feathery pubesc. Head without a neutral ray, Lvs. lin. quite entire, Stem somew. shrubby

** *Involucrum with ciliated appendages.*

12544 Scales of the invol. ovate ciliated with capillary teeth, Lower leaves angular lyrate : upper ones ovate
12545 Innermost invol. scales scarious, Root lvs. obsoletely pinnatif. : lower stem ones somew. tooth. at the base ; upper ones undivided quite entire
12546 Invol. serrated with white ciliæ, Leaves decurrent deeply pinnatifid, Pinnæ generally two
12547 Invol. serrated, Leaves smoothish lanceolate quite entire decurrent, Stem simple
12548 Invol. ciliated variegated, Leaves sessile linear downy, Stem 1-headed
12549 Scales of the involucre serrated, Leaves linear entire : the lowermost toothed
12550 Invol. ciliated egg-shaped, Scales flat close-pressed : Lower lvs. bipinnatif. : upper pinnatif. Stem panicled
12551 Invol. ciliated, Root lvs. undivided and pinnatifid smooth, Stem lvs. downy pinnatifid, Branches spinous

and Miscellaneous Particulars.

1819. *Centaurea.* It is said, that with this plant, the *Centaur* Chiron cured the wound in his foot made by the arrow of Hercules. Crupina is from the Dutch verb *kruipen*, which signifies to creep ; because the dark multifid pappus resembles the legs of a creeping insect.

Phrygia signifies dry (φρυγιος), in allusion to its calyx.

Jacea is said to have been so named from *jacere*, to lie down, on account of its prostrate habit.

Calcitrapa, the Latin of a caltrop, or iron ball covered with stiff spines, formerly used in warfare to impede the operations of cavalry. Its calyx is very like one of these instruments.

Centaurea Crocodilium is so named, because the spines of the calyx have been fancifully likened to the claws of a Crocodile.

Verutum, the name of another species, is the Latin of a short javelin used by the Roman foot-soldiers. The spines on its calyx resemble a small dart.

C. nigra is a harsh stubborn weed in meadows and permanent pastures, seldom touched by cattle either green or in hay, and with difficulty extirpated. C. cyanus, *Bluet*, Fr., *Kornblume*, Ger., and *Ciano*, Ital., is a common weed in corn fields, on gravelly soils, throughout Europe, and also a popular border annual. The expressed juice of the natural florets makes a good ink ; it also stains linen of a beautiful blue, but the color is not permanent. C. benedicta was so called from its being supposed to possess extraordinary medical powers ; it was

History, Use, Propagation, Culture,

said not only to destroy worms and cure fevers, but also the plague, and the most putrid and stubborn ulcers and cancers. At present it is in no estimation whatever.

It has by some botanists been thought advisable to separate this genus into several others; but the differences upon which the separation has been made depend upon variations in the form of the involucrum,

12552 Involucre ciliated, Leaves downy very white all compound : lowest bipinnatifid ; highest pinnate-laciniated
12553 Involucre ciliated, Leaves somewhat downy cinereous : lower ones pinnate-laciniate ; upper ones simple
12554 Involucre ciliated, Lvs. downy undern. Root lvs. bipinnatifid : segm. lanceolate acute, Stem-leaves pinnatifid
12555 Involucre serrated, Leaves downy : root ones pinnated ; upper 1-eared
12556 Involucre ciliat. smooth, Lvs. pinnatif. scabr. Segm. obl. lanc. acute : highest root ones sometimes cut at base
12557 Involucre ciliated sphacelate, Scales spreading, Leaves obl. lanc. entire villous downy : cauline decurrent
12558 Involucre scales roundish egg-shaped ciliated, Leaves oblong lanc. undivided very scabrous acute serrated
12559 Involucre scales ovate lanceolate serrate-ciliated, Leaves bipinnatifid, Segments lanceolate
12560 Involucre egg-shaped smooth, Scales somew. scar. at tip, Lvs greenish decurr. undivided : radical ones lyrate
12561 Inv. scales scar. at tip serr. Lvs.scab. at edge : root ones obl. tooth. ; stem ones lanc.somew.decurr. quite ent.
12562 Scales of the involucre ciliated ovate pubescent, Leaves pinnatifid roughish : the segm. lanceolate acute
12563 Involucre ciliated nearly globular, Leaves deeply pinnatifid, Segments linear
12564 Involucre ciliated ovate roundish beautifully spotted, Leaves slender bipinnatifid, Stem a little panicled
12565 Involucre ciliated oblong, Leaves pinnatifid linear quite entire
12566 Involucre serrated, Leaves oblong serrated decurrent and undivided [branched divaricated
12567 Involucre ciliat. Scales ovate-lanc. spread. at tip, Lower lvs. bipinnatif. lanc. lin. : upper ones pinnatifid, Stem
12568 Involucre ciliated, Leaves lanceolate serrated : lowest tooth elongated so as to appear like a stipule
12569 Involucre ciliated, Leaves downy pinnatifid, Segments obtuse egg-shaped quite entire : outer ones largest
12570 Involucre ciliated, Leaves scabrous : underneath pinnatifid, Segments lanceolate sometimes toothed
12571 Involucre scarious, Scales ovate lanceolate serrated ciliated, Leaves scabrous beneath : radical bipinnatifid

§ 2. CALCITRAPA. *Involucrum ciliated with spines.*

* *Spines simple.* [panicled

12572 Involucre erect feathery, Head without a neutral ray, Lower lvs. pinnatif. : upper ones lin. All quite ent. Stem
12573 Involucre ciliate-spinous egg-shaped, Scales reflexed at tip, Lvs. hoary : root ones lyrate ; stem ones linear
12574 Involucre ciliate-spinous at tip, Spines of lower scales reflex. Lvs. pinnat. Pinnæ lin.obt. Root leaves bipinnat.
12575 Involucre ciliate-spinous, Leaves lyrate-pinnated generally entire : terminal lobe large toothed
12576 Involucre ciliate-spinous, Stem-leaves pinnatifid : root ones bipinnatifid, Segments lanceolate
12577 Involucre ciliate-spinous, Stem-leaves pinnated : root leaves bipinnated, Pinnæ linear-filiform
12578 Involucre ciliate-spin. at tip, Stem-lvs. pinnatif. lin. lanc. : root ones bipinnatif. Segm. lanc. terminal 1-toothed
12579 Involucre ciliate fringed with straight rigid white bristles, Lvs. obl. a little toothed, Head yell. without a ray
12580 Involucre simply spinous, Spines spreading, Florets equal, Leaves hairy : lower ones pinnatifid
12581 Involucre bristly spinous, Leaves lanceolate petioled toothed near the base
12582 Involucre scarcely spinous somewhat awned rayed, Leaves pinnatifid
12583 Involucre ciliated spinous, Stem-leaves pinnated quite entire : root-leaves bipinnatifid
12584 Involucre ciliate spinous at the tip, Leaves hoary pinnatifid quite entire : upper ones linear-lanceolate
12585 Involucre ciliate subspiny, Leaves oblong downy sessile somewhat toothed ; narrowed at base deeply toothed

** *Spines palmate.*

12586 Involucre palm.-spin. Spines reflex. Lvs. obl. smooth. embracing the stem ½ decurr. repand tooth. Teeth prickly
12587 Involucre palm.-spinous, Spines reflex. Lvs. obov. somew. tooth. stalked : floral somew. decurr. mucro.-toothed
12588 Inv. palm.-spin. Spines reflex. Lvs. obl. hoary embrac. stem ½-decurr. tooth. cut at base, Teeth rather prickly
12589 Involucre palm. spinous, Lvs. decurr. not prickly : root ones pinnatifid ; terminal lobe very large
12590 Inv. palm. spin. Spines reflex. larger than calyx, Lvs. hoary obl. sess. decurr. pinnatifid, Teeth not prickly
12591 Involucre palmate spinous, Lvs. ovate-lanc. petioled toothed
12592 Involucre palmate spinous solitary sess. Lvs. lanc. a little embracing the stem pinnatifid toothed
12593 Involucre palmate spinous, Stem lvs. lanc. toothed decurrent : root lvs. lyrate obtuse
12594 Involucre palmate spinous, Spines 3 or 5, Lvs. lanc. sessile toothed
12595 Involucre ciliated surrounded by a whorl of long lvs. Lvs. lyrate toothed obtuse
12596 Involucre palmate spinous, Lvs. embracing the stem runcinate pinnatifid prickly : toothed root ones lyrate
12597 Involucre doubly spinous woolly bracteated, Leaves half decurrent toothed spiny
12598 Involucre palm. spinous term. solitary, Spines straight, Lvs. lanc. decurr. not prickly : root ones lyrate
12599 Involucre palm. spin. term. ones clustered sess. Spines straight, Lvs. lanc. scabrous decurr. not prickly : lower stem ones a little toothed ; root ones sinuated
12600 Involucre palm. spinous solitary subsessile, Spines straight, Lvs. lanc. scabrous toothletted decurrent
12601 Inv. palm. spin. Spines spread. Lvs. scabr.: stem lvs. lanc. a little embrac. stem finely tooth. ; root ones lyrate
12602 Involucre palm. spinous solit. Spines straight : inner scales scarious at the tip, Lvs. downy lanc. decurr. : lower ones finely toothed pinnatifid at the base
12603 Involucre palmate spinous terminal sess. glomerated, Leaves petioled pinnatifid cut-toothed

*** *Appendages of involucrum spiny-pinnate.*

12604 Involucre doubly spinous woolly, Lvs. half decurrent entire and sinuated, Stem proliferous
12605 Involucre doubly spinous sess. Lvs. pinnatifid toothed, Stem divaricated spreading hairy
12606 Involucre somewhat doubly serrated, Lvs. embracing the stem lanc. undivided serrated [entire decurr.
12607 Inv. palm. spin. : midd. spine very long ; lat. ones short, Root-lvs. sinuate-pinnatif. Stem ones lanc. quite
12608 Involucre doubly spinous somewhat woolly, Lvs. sess. lanc. entire and toothed, Stem proliferous

and Miscellaneous Particulars.

unconnected with differences of organization ; they are therefore not adopted here. The tribe of Centaurcæ of M. Cassini is not distinguished from Carduineæ by any very important characters. The greater part of the species are natives of Europe and Asia, several of Africa, a very few of America, and none of the southern parts of the world.

History, Use, Propagation, Culture,

C. moschata is a handsome border annual, of which there is a white-flowered variety. C. Centaurium, montana, spiendens, and glastifolia, are among the most ornamental of the perennials.

1820. *Galactites.* A plant formerly included in Centaurea, and named on account of the milky veins of its leaves (γαλα, milk).

1821. *Wedelia.* Named after George Wolfgang Wedel, a German, born in 1625, died in 1721. He was professor at Jena, and published many learned dissertations upon the plants of the ancients. There was also a John Adolphus Wedel, professor in the same university.

§ 3. CROCODYLIUM. *Involucrum not ciliated, but spiny at end.*

12609 Invol. globul. smth. Spine very small weak a little reflex. Lvs. lanc.serrat. : root ones lyrate, Stem divaricat.
12610 Invol. simply spinous villous, Lower lvs. lyrate toothed : upper ones lanc. Peduncles very long
12611 Invol. scarious simply spinous, Lvs. pinnatifid quite entire terminal : segm. larger toothed

§ 4. RHAPONTICUM. *Leaves of involucrum with a round scarious appendage, which is often lacerated.*

12612 Invol. scales lacerated, Lvs. ovate-obl. finely toothed tomentose [ones lyrate
12613 Invol. conical hard, Scales ending in a patulous point, Lvs. somew. tomentose decurr. undivided : root
12614 Inv. egg-shap. Scales mucronat. Lower lvs. bipinnatif. lin. : upper one pinnat. Pinnæ lin. sometimes toothed
12615 Invol. ciliated, Scales acum. somew. thorny, Lvs. obl. pinnatif. Florets of the ray longer than those of disk
12616 Invol. scarious, Scales dilated cut, Lvs. linear-lanc. : radical cut
12617 Scales of invol. scarious torn : lower ones pinnatifid, Lvs. lin. lanc. : the lower ones broader and toothed
12618 Invol. scales roundish quite ent. Lvs. obl. smth. : root ones serrat. Stem ones sometimes slightly cut at base
12619 Invol. scales entire mucronated, Lvs. pinnate toothed : stem ones linear toothed at the base
12620 Stems decumbent, Lvs. lanc. quite entire
12621 Invol. cylindrical, Scales mucronated, Lvs. pinnated, Pinnæ lin. mucronated quite entire
12622 Invol. scales egg-shaped obtuse ciliated, Lvs. downy on both sides pinnatif. and undivided, Stem declining
12623 Leaves undivided quite entire decurrent
12624 Invol. scales pectinate ciliated, Lvs. deeply pinnatifid, Segm. linear lanceolate [the stem decurrent
12625 Invol. conical, Scales quite ent. Lvs. coriaceous reticularly veined : root ones lyrate ; stem ones embracing
12626 Leaves lanc. toothed somewhat petioled, Peduncles filiform leafless

§ 5. *Leaves of involucrum neither ciliated, nor spiny, nor with a scarious appendage.*

12627 Invol. roundish smooth, Scales egg-shaped, Lvs. lyrate toothed
12628 Invol. scales egg-shaped, Lvs. pinnated, Leaflets decurrent serrated
12629 Invol scales egg-shap. obt. Lvs. pinnat. smooth, Leafl. cartilagin. sharply serrat. termin. one obl. egg-shaped
12630 Invol. round. smooth, Lower lvs. broad somew. spatul. tooth. : upp. ones lyr. at base, Head yell. sweet-scent.
12631 Invol. scales linear awl-shaped, Leaves pinnated serrated
12632 Invol. scales mucronate, Leaves somewhat decurrent lyrate toothed
12633 Invol. pubescent, Scales roundish obtuse, Leaves deeply pinnatifid : lowest segments toothed
12634 Invol. scales egg-shaped obtuse, Leaves pinnated smooth quite entire odd one serrated

12635 Invol. bristly spinous, Leaves decurrent sinuated spinous downy underneath.

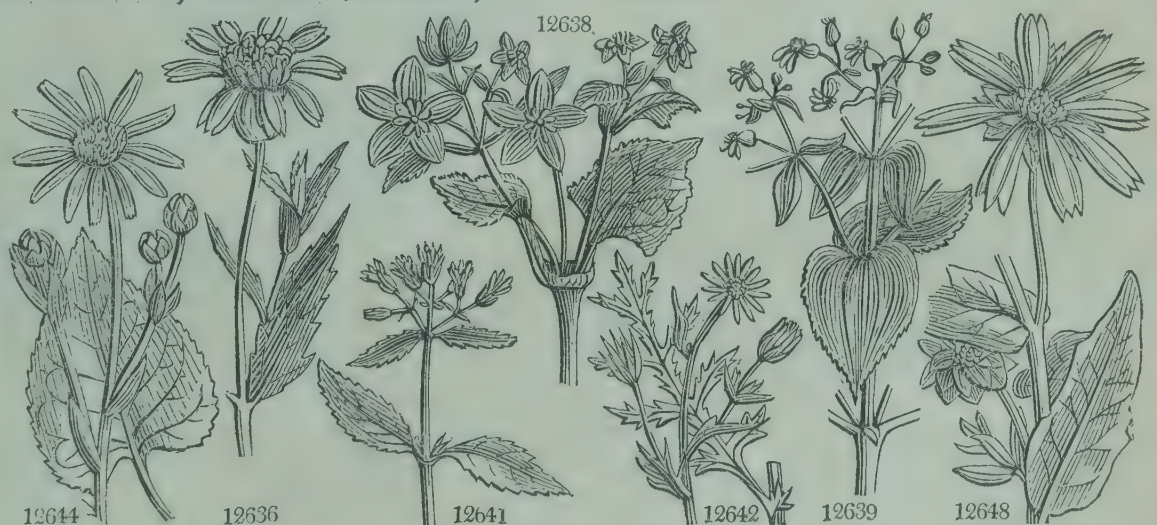
NECESSARIA.

12636 Leaves lanceolate acuminate serrated with a large tooth on each side at the base
12637 Leaves ovate-lanceolate, Invol. urceolate squarrose, Rays imbricated
12638 Stem herbacaous, Leaves rhomboid narrowed at base connate

12639 Leaves stalked roundish-ovate narrowed at base : floral subcordate, Pedunc. terminal dichotomous
12640 Leaves stalked oblong ovate ciliated, Pedunc. terminal aggregate

12641 Stem winged, Heads pale-yellow small

12642 Radical and cauline leaves pinnatifid, Stem hirsute
12643 Cauline leaves sinuate pinnatifid : radical ternate sinuate multifid
12644 Leaves alternate ovate serrated scabrous : radical cordate
12645 Leaves opposite deltoid stalked perfoliate, Stem square smooth
12646 Lvs. opp. conn. unequally toothed, Stem smooth square, Four outer sc. of invol. longer than the inner
12647 Leaves sessile stalked, Stem round scabrous
12648 Leaves opposite or alternate sessile oblong hairy : lower serrate, Stem round hispid
12649 Stems 6-angled, Leaves ternate ovate toothed, Panicle trichotomous
12650 Stems round, Leaves ternate somewhat toothletted, Panicle dichotomous
12651 Stems round, Leaves about 4 toothletted, Panicle dichotomous



and Miscellaneous Particulars.

1822. *Milleria.* So named by Linnæus, after Philip Miller, F. R. S., the well known author of the Gardener's Dictionary, and considered the first botanical gardener of his time. He was born in 1692, and died in 1769.

1823. *Baltimora.* This plant grows in the neighbourhood of Baltimore.

1824. *Silphium.* D'Herbelot asserts, that *silphi* or *serpi*, was a name given by the natives of Africa to the plant which produced the *laser* of the Romans, a substance held in great esteem among them for its flavor and its medicinal properties. All the species are tall herbaceous plants with bright yellow flowers, and are very proper ornaments for a shrubbery.

History, Use, Propagation, Culture,

1825. *Trixis.* From τρεις, three, on account of its triangular capsule with three cells.

1826. *Polymnia.* Polymnia was the name of one of the Muses. Why it has been applied to this plant is not very obvious. A coarse broad-leaved weedy plant.

1827. *Chrysogonum.* From χρυσος, gold, and γονυ, a knee. The bright yellow flowers are usually produced in the bends of the stems.

1828. *Melampodium.* One of the Greek names of black hellebore, with which the modern plant has no relation. The plant of the ancients was probably named from the blackness of the roots, (μελας, black, and πους, a foot).

1829. *Chaptalia.* Dedicated by Ventenat to the famous French chemist, M. Chaptal. A pretty little North American herbaceous plant.

1830. *Calendula.* So named because it may be found in flower during the *Calends* of each month, or, which is the same thing, during every month in the year. C. pluvialis has been named from its flowers closing at the approach of rain.

12652 Herbaceous downy, Leaves sinuate pinnatifid toothed: cauline amplexicaul.

12653 Leaves toothletted acuminate: lower pinnatifid; upper 3-lobed or entire
12654 Leaves 3-lobed acute running down the petiole: lobes angular sinuated
12655 Leaves opposite sessile oblong lanceolate somewhat toothed, Invol. 5-parted, Florets all female

12656 Leafstalks longer than leaves

12657 Stem erect, Leaves somewhat linear 1-toothed on each side
12658 Stem erect, Leaves lyrate-toothed sessile

12659 Leaves ovate-oblong entire silvery beneath, Scape naked 1-headed, Head nodding

12660 Pericarps cymbiform muricated incurved: outer lanceolate-subulate muricated at back
12661 Pericarps cymbiform muricated incurved: outer ovate with a membranous edge toothed crested at back
12662 Pericarps cymbiform incurved muricated: outer 5 ovate-lanceolate membranous toothed at edge
12663 Pericarps cymbiform all incurved muricated

12664 Pericarps urceolate obovate smooth, Involucre somewhat muricated
12665 Pericarps cymbiform smooth: outer subulate erect somew. muricat. Lvs. obl. spatul. downy on each side
12666 Leaves narrow lanceolate sinuate toothletted, Stem leafy, Peduncles filiform
12667 Leaves oblong lanceolate blunt toothed, Stem leafy, Peduncles thickened at end
12668 Leaves lanceolate sinuate toothed, Stem nearly naked
12669 Leaves linear nearly entire, Stem nearly naked
12670 Leaves linear somewhat toothletted muricate dotted beneath, Pericarps orbicular, Stem suffruticose

12671 Leaves cuneate cut toothed glabrous, Invol. downy ciliated, Stem shrubby weak
12672 Leaves opposite linear entire somewhat fleshy smooth
12673 Leaves obovate somewhat toothed, Stem fruticose decumbent
12674 Leaves obovate sublyrate roughish, Stem suffruticose erect
12675 Lvs. obl. toothed scabrous, Invol. in fruit cernuous, Pericarps nearly orbicular, Stem fruticose panicled
12676 Peric. cymbif. incurv. muricat.: outer lanc. subulate muricated erect, Lvs. obl. spatul. downy on each side
12677 Pericarps all uniform incurved cymbiform muricated, Leaves lanceolate toothletted acute smoothish
12678 Leaves oblong papillose scabrous: lower toothed; upper entire, Stem shrubby

12679 Radiant florets fertile, Stem very short decumbent, Leaves hoary on each side ternate lyrate
12680 Radiant florets fertile, Leaves downy beneath ovate entire or lyrate-toothed, Scape furrowed 1-headed
12681 Radiant florets fertile, Leaves downy beneath wavy-toothed ovate or lyrate, Scapes 1-headed
12682 Leaves pinnatifid toothletted cobwebbed 3-nerved
12683 Radiant florets fertile, Leaves hoary pinnatifid repand somewhat toothed, Outer scales of invol. reflexed
12684 Radiant florets fertile, Leaves lanceolate ovate nerved toothletted amplexicaul.
12685 Radiant florets fertile, Leaves lanceolate linear entire downy
12686 Radiant florets fertile, Stem procumbent, Leaves spatulate-lanceolate repand-toothed hoary
12687 Radiant florets fertile, Stem procum. Leaves obl. lanc. unequally toothed hoary downy beneath 3-nerved
12688 Radiant florets fertile, Stem branched ascending, Leaves downy spatulate lanceolate 3-nerved pubescent
12689 Radiant florets fertile, Stem branched ascending, Leaves spatulate lanceolate entire 3-nerved downy
12690 Radiant florets fertile, Stem shrubby, Leaves hairy oblong undivided somewhat toothed
12691 Radiant florets fertile, Stem shrubby erect hoary, Lvs. obov. oblong vill. toothed decurr. down the petiole
12692 Radiant florets fertile, Stem ascend. Lvs. hairy hoary beneath: lower lyrate-toothed; upper lanc. tooth.
12693 Radiant florets fertile, Stem snow white, Leaves lyrate amplexicaul. downy toothed: term. lobe rhomb.
12694 Radiant florets fertile, Stem erect, Leaves hairy oblong toothed, Outer scales of invol. reflexed ciliated

and Miscellaneous Particulars.

C. officinalis, *Souci du jardin*, Fr., *Goldblume*, Ger., and *Furrancio*, Ital., has been a garden plant time out of mind, and used in soups and broths, both to color them, and as comforters of the heart and spirits. It had formerly many virtues ascribed to it, but is now totally out of use in this country. According to Linnæus, the flowers are open from nine in the morning till three in the afternoon. There are double, lemon-colored, and prolific varieties. From the flowers of Calendula officinalis is obtained a distilled water, a kind of vinegar, and a conserve.

With this genus for his type, M. Cassini has formed a small tribe which he calls Calenduleæ, remarkable for a peculiar smell, very perceptible in the common pot-marygold, which is said to be confined to themselves alone. But this seems to be almost the only character by which they are distinguished from Heliantheæ. The greater part of Calenduleæ are found in the country of the Cape of Good Hope; but some are found in Europe and Asia.

1831. *Arctotis.* Vaillant, who named this genus, called it *Arctotheca*, from αρκτος, a bear, and θηκη, a capsule, because its fruit is shaggy like a bear. This and some neighbouring genera have given rise to M.

History, Use, Propagation, Culture,

Cassini's tribe of Arctotideæ, which has the remarkable peculiarity of occasionally producing an ovarium with three cells. In the peculiarities of their style they approach the tribes of Echinopseæ, Carduineæ, Cenaureæ, and Carlineæ. They are entirely confined to the regions of the Cape of Good Hope.

1832. *Osteospermum.* From οστεον, a bone, and σπερμα, seed, in allusion to the hardness of the fruit.

1833. *Othonna.* Dioscorides mentions this name as being applied to various things, but especially to a plant with a leaf like rocket, but perforated with little holes, whence it was called Othonna, from οθονη, linen. The plant of the ancients can have had little affinity with that of the moderns.

1834. *Hippia.* A name applied by Cordus to the common Chickweed, because it was agreeable food for

12695 Radiant florets fertile, Stem erect, Leaves hoary viscid oblong amplexicaul. mucronate-toothed
12696 Radiant florets fertile, Leaves pinnatifid lyrate angular toothed downy beneath
12697 Radiant florets fertile, Stem erect, Leaves pinnatifid scabrous downy beneath revolute at edge
12698 Radiant florets fertile, Outer scales of invol. reflexed cuneate obl. with a broad short point somew. cobw.
12699 Radiant florets fertile, Stem erect, Leaves pinnatifid lyrate hoary downy beneath, Invol. imbricated
12700 Stemless, Leaves lyrate pinnatifid hoary beneath 3-nerved, Outer scales of invol. linear recurved
12701 Radi. flor. fertile, Stem erect, Branches downy hairy, Lvs. pinnatif. downy ben. : seg. lin. lanc. angul. downy
12702 Radiant florets fertile, Stem erect, Pedunc. hairy, Lvs pinnatif. hoary downy ben. : seg. lanc. angul. toothed
12703 Radiant florets fertile, Stem erect, Leaves downy beneath : segm. linear subpinnatifid wavy
12704 Radiant florets fertile, Leaves hoary downy long-stalked pinnatifid : segm. lanceolate blunt toothed

12705 Leaves lanceolate glabrous, Heads panicled
12706 Leaves obovate serrate downy, Spines branched
12707 Leaves lanceolate pinnatifid-toothed scabrous, Spines branched
12708 Leaves lanceolate mucronate somewhat stalked smooth serrated, Branches toothletted angular
12709 Leaves obovate serrated stalked subdecurrent
12710 Leaves oblong toothed-angular scabrous ½-amplexicaul. Branches furrowed
12711 Leaves toothed pinnatifid hairy, Branches unarmed
12712 Leaves pinnatifid smooth, Segments lanceolate unequally serrated
12713 Leaves lanceolate scattered decurrent smooth entire, Axillæ woolly

12714 Leaves pinnatifid : pinnæ lanceolate entire decurrent
12715 Leaves pectinate-pinnatifid downy : segm. linear toothed at the edge
12716 Leaves pinnate filiform, Invol. hemispherical many-toothed
12717 Leaves multifid pinnated linear, Joints of stem villous
12718 Leaves lanceolate 1-toothed on each side in the middle or entire, Peduncles axillary, Stem divaricating
12719 Lower leaves lanceolate entire : upper sinuate toothed
12720 Leaves lanceolate 3-nerved entire, Stem suffruticose creeping
12721 Leaves deeply pinnatifid glabrous : segments linear somewhat toothed, Stem herbaceous
12722 Leaves pinnatifid very small, Peduncles long slender axillary 1-headed, Ray longer than disk
12723 Leaves lanceolate entire somewhat fleshy, Stem erect
12724 Leaves oblong toothletted smooth narrowed at base amplexicaul. Heads panicled
12725 Radical leaves ovate angular toothed : cauline lanceolate entire
12726 Leaves entire : radical lanceolate ; cauline lanceolate subcordate ½-amplexicaul. Stem erect
12727 Leaves entire : radical cordate ; cauline ovate-lanceol. cordate at base amplexicaul. Stem flaccid filiform
12728 Leaves ovate somewhat toothed, Peduncles 1-headed very long
12729 Root tuberous, Leaves amplexicaul. Peduncles 1-headed
12730 Leaves lanceolate smooth amplexicaul. Heads panicled
12731 Stem dichotomous imbricated : leaflets acerose, Peduncle very long solitary in the divarications
12732 Leaves filiform fleshy, Stem shrubby
12733 Leaves oblong entire, Stem arborescent fleshy with woolly scars
12734 Fleshy naked smooth a span high, Leaves fascicled obovate sessile, Peduncle 1-headed

12735 Shrubby villous, Leaves pinnatifid, Heads corymbose
12736 Hispid erect, Leaves ovate serrated 5-nerved, Racemes terminal

12737 Leaves pinnated : leaflets linear many-times lobed acute, Pericarps cuneiform hairy

12738 The only species

12739 Leaves entire and divided, Heads corymbose
12740 Leaves linear silky

12741 Stem erect prolifer. at summit, Lvs. lanc. downy acute, Fls. capitate in the axils of branches and terminal
12742 Stem erect dichotom. Lvs. lin. acum. downy, Fls. crowded axill. and term. Clust. much shorter than leaves
12743 Stem erect subdichotomous, Leaves lanceolate spatulate downy, Flowers clustered axillary and terminal

and Miscellaneous Particulars.

horses, *ἱππος*, a horse ; and given to this plant by Linnæus for no reason whatever. Little plants resembling Tansy.

1835. *Soliva.* Named by the authors of the Flora Peruviana, after Salvator Soliva, a Spanish physician and botanist.

1836. *Psiadia.* From *ψιας*, a drop of dew, in allusion to the dew-bespangled foliage of the plants.

1837. *Eriocephalus.* From *εριον*, wool, and *κεφαλη*, a head, on account of the woolly grains collected in terminal heads.

1838. *Filago.* All the parts of these plants are covered with delicate threads or *fila.*

History, Use, Propagation, Culture,

1839. *Micropus.* From μικρος, small, and πους, a foot; so called with reference to Leontopodium (which see), than which it is smaller, but which it resembles in its velvety silvery leaves.

1840. *Parthenium.* The Greek name of the Matricaria, which see. The indecent derivation of the word *Hysterophorus*, is sufficiently explained by Vaillant. (*Mem. Acad. Sciences, anno* 1720.)

1841. *Iva.* This name, according to Fuchsius, is a mere abbreviation of *abiga*; see Ajuga. It has been applied by Linnæus to these plants because their smell resembles that of the ancient Iva.

1842. *Acicarpha.* From ακις, a point, and καρφος, a palea, because that appendage is spiny.

1843. *Elephantopus.* It is said that some resemblance may be found between the radical leaves of this plant and an elephant's foot (ελεφας, an elephant, and πους, a foot).

1844. *Œdera.* After George Œder, a Dane, professor of botany at Copenhagen, and the founder of the extensive Flora Danica.

1845. *Flaveria.* From *flavus*, yellow, because the plants are used in Chili for dying of that color.

12744 Stem erect subdichotomous, Lvs. lin. lanc. appressed downy, Flowers clustered axillary and terminal
12745 Stem erect branch. Branch. sprdg. Lvs. lanc. acute cottony, Fls. conic. clust. lat. term. Clust. longer than lvs.
12746 Stem erect panicled, Leaves oblong lanceolate woolly, Heads clustered lateral and terminal downy
12747 Stem erect branched, Lvs. lanc. cord. at base amplexicaul. woolly, Heads clust. lat. and terminal downy
12748 Leaves nearly glabrous above, Spike longer more interrupted
12749 Stem herbaceous quite simple, Leaves oblong spatulate downy beneath hoary, Heads clustered
12750 Stem erect branched, Lvs. obov. spatulate downy beneath, Heads axillary and terminal clustered spiked
12751 Stem decumb. branch. only from base, Flower. stems erect, Fls. solit. or racem. Lvs. lin. downy on both sides
12752 Stem quite simple nearly erect about 3-flowered, Leaves linear acute downy, Runners procumbent
12753 Stem branched erect, Leaves linear 3-nerved acute very narrow at base downy beneath
12754 Stem simple, Leaves linear 3-nerved acuminate silky beneath, Heads terminal clustered [than lvs.
12755 Stem very much branch. diffuse woolly, Lvs. lin.-lanc. downy, Fls. in term. crowded clust. which are shorter
12756 Stem simple nearly erect downy, Fls. axillary forming a distant leafy spike Leaves linear lanc. downy

12757 Leaves opposite obovate cuneate
12758 Leaves alternate lanceolate, Heads woolly

12759 Leaves bipinnatifid
12760 Leaves undivided oblong toothed

12761 Leaves lanceolate-ovate, Bractes lanceolate and petioles downy
12762 Leaves lanceolate dotted scabrous deeply serrated, Stem shrubby

12763 Leaves spatulate

SEGREGATA.

12764 Leaves scabrous : radical narrowed at base ; cauline lanceolate, Stem branched strigose
12765 Radical and cauline leaves oblong narrowed at base somewhat hairy, Stem simple hairy
12766 Leaves ovate downy

12767 Leaves lanceolate serrated reflexed

12768 Leaves somewhat stalked lanceolate 3-nerved mucronate-serrate

12769 Leaves mucronate subulate reflexed, Stem erect
12770 Leaves linear subulate oblique, Spike cylindrical

12771 The only species

12772 Leaves lanceolate-linear smooth glandular beneath, Corymbs decompound
12773 Panicle decompound, Leaves lanceolate decurrent with their under surface and the branches woolly
12774 Corymb nearly sessile, Leaves small linear white beneath

12775 Leaves lanceolate serrate decurrent glabrous, Peduncles winged, Wings of stem and peduncles serrated
12776 Leaves decurrent ovate serrated, Peduncles round
12777 Leaves obovate serrated hairy decurrent, Peduncles winged, Wings of stem and peduncles serrated

and Miscellaneous Particulars.

1846. *Stœbe.* The name under which Theophrastus and Pliny designate a plant of a rough and spiny habit. This is the character of the modern plant, which is very dissimilar to that of the ancients, which is believed to have been Poterium spinosum.

1847. *Naumburgia.* Named by Willdenow without explanation ; but we presume in honor of John Samuel Naumburg, author of a Dissertation upon Veronica Chamædrys, &c., published at Erfurt in 1792.

1848. *Cassinia.* Named after M. Henri Cassini, a celebrated French botanist, who has devoted much attention to the study of the very difficult tribe of plants to which this belongs, and with singular success. But his observations are scattered through so many different works, that it is almost hopeless to acquire a knowledge of their actual extent. Neat New Holland shrubs with white or yellow flowers.

1849. *Sphæranthus.* From σφαιρα, a globe, and ανθος, a flower, on account of the globular form of the heads of flowers.

1850. ECHI'NOPS. *W.* Globe Thistle. *Compositæ.* *Sp.* 7—9.

History, Use, Propagation, Culture,

1850. *Echinops.* From ἐχινος, a hedgehog, and ὀψις, resemblance; because of the bristly round heads of flowers protected in every direction by stiff spines. The woolly leaves of Echinops strigosus are employed in Spain as tinder. Upon this genus M. Cassini has founded his tribe of Echinopseæ, which it must be confessed is entirely distinct from any other, and extremely remarkable on account of its very singular aberrations from the ordinary structure of Compositæ.

1851. *Rolandra.* After Daniel Rolander, a pupil of Linnæus, who visited Surinam. Nothing appeared from him except an account of Doliocarpus in the seventeenth volume of the Transactions of the Academy of Sciences of Stockholm.

12778 Leaves pinnatifid downy above woolly beneath, Stem branched
12779 Heads scattered with long spines
12780 Head globose, Leaves pinnatifid smooth above
12781 Heads fascicled, Lateral invol. sterile, Leaves strigose on the upper side
12782 Stem branched woolly, Leaves subbipinnate: segments narrow smooth above, Head subsessile
12783 Leaves rugose squarrose pinnatifid smooth above glaucous with down beneath
12784 Stem simple upright 1-headed, Leaves eroded pinnatifid spiny-toothed smooth above downy beneath

12785 The only species

12786 Heads corymbose numerous

12787 Leaves long and spiny

12788 The only species

and Miscellaneous Particulars.

1852. *Brotera.* Named after Felix Avelhar Brotero, a Portuguese botanist, professor at Coimbra; author of a useful Flora Lusitanica.

1853. *Gundelia.* Named after Andrew Gundelsheimer, a German botanist, who accompanied Tournefort in his journey into the Levant in 1709.

1854. *Euxenia.* A name unexplained by its author. Apparently derived from ευξενος, hospitable, but in what sense we do not perceive.

Class XX. — GYNANDRIA.

The singular plants which constitute this class are distinguished from all others by the anomalous structure of their flowers. These do not, as is usually the case, contain a certain number of stamens surrounding a central ovarium or style, but on the contrary are furnished with a solitary fleshy undivided process, round which the sepals radiate, and which supplies the place of stamens and style. The nature of this process has been variously explained: the modern opinion is that it is formed by the accretion of the stamens and style into a single mass, and this opinion seems to be confirmed by analysis and analogy. Omitting, therefore, a notice of such theories respecting its nature as are opposed to that which is now received as the most correct, it will suffice to explain a little in detail, the opinion which is adopted in this work. The central process, called the columna or column, is understood to be formed by the filaments of three stamens surrounding a style, and by mutual accretion firmly united with it and with each other into a solid mass. Of these three stamens, it most frequently happens that the *two lateral* are sterile, and not furnished with even the vestige of an anthera; and that their presence is not indicated by more than two irregular excrescences, as in Orchis, or by the same number of small appendages, as in Satyrium, or by two horn-like or tooth-like processes, present in several of the genera with waxy pollen-masses: it even happens, and not unfrequently, that no vestige whatever of them remains. But in Cypripedium both are fertile and bear perfect anthers, while the central stamen is barren and foliaceous. When the lateral stamens are, as above stated, abortive, which is the most common form of the columna, the central stamen bears at its upper extremity an anther, which is either moveable or fixed firmly in its place. The pollen which this contains, assumes three very distinct appearances in different tribes. It is either granular, dividing into many separable small pieces, as in Orchis; or powdery, consisting of an infinite number of granules, as in Spiranthes; or waxy, when it consists of a few large concrete masses, as in Epidendrum. The stigma is most frequently concave, and placed nearly under the anther, but in such a manner, that there is no contact between it and the pollen. In what way, therefore, fecundation can take place among truly Gynandrous plants, is one of those mysterious contrivances of nature which has not yet been explained. It is generally believed to take place by absorption in some undiscovered manner, before the flowers expand; but it is extremely difficult to understand how this can occur in many genera. The foregoing remarks apply only to the tribe of plants called Orchideous. The few genera attached to the latter part of the class are Gynandrous by the cohesion indeed of their stamens and style, but in a much more obvious manner.

Gynandrous plants are among the most interesting of the vegetable productions of the globe, whether we consider the vivacity of their colors, or the singularity of their organization, or the grotesque appearance of their tortuous roots, or the delicious perfume of their flowers. They are distributed in abundance over all the earth. In Europe and the temperate parts of the world, they are principally found in meadows and pastures among grass; but in tropical regions they often constitute the chief beauty of the forest, occupying the forked branches of living trees, or the prostrate trunks of fallen timber, over which, in company with ferns and parasitical Aroideæ, they climb and trail in every direction, until they adorn the one with bright hues and rich odours foreign to their nature, and render the others more beautiful in death, than in the full vigour of their existence.

Order 1. MONANDRIA. Stamen 1.

§ 1. *Anther terminal, erect. Pollen granular, cohering by an elastic thread.*

1855. *Disa.* Flowers ringent: helmet with a spur or bag at the base. Inner sepals united to the column. Lip without a spur.

1856. *Satyrium.* Flower ringent: five anterior sepals united at base. Lip behind, fornicate with two spurs or bags at the base. Anther resupinate. Stigma 2-lipped.

1857. *Platanthera.* Flower vaulted. Lip entire with a spur. Cells of the anther widely divided at their base by the broad interposed stigma. Glands of pollen masses naked. Lips of stigma absent.

1858. *Gymnadenia.* Cor. ringent. Lip spurred at the base beneath. Glands of the stalks of the pollen-mass naked, approximate.

1859. *Orchis.* Cor. ringent. Lip spurred on the underside at the base. Glands of the stalks of the pollen-mass (1-2) contained in one common little pouch.

1860. *Nigritella.* Ovary straight. Flower spreading. Lip posterior, entire, with a scrotiform spur. Glands of pollen-masses distinct, and enclosed in a single 2-celled pouch.

1861. *Habenaria.* Cor. ringent. Lip spurred on the upper side at the base beneath. Glands of the stalk of the pollen-mass naked, distinct, with the cells of the footstalks adnate or separated.

1862. *Bartholina.* Flower ringent: inner sepals united below with the lip. Lip spurred beneath at the base. Stalks of the pollen-masses long; cells united to the column: glands distinct, half covered by the exterior lobe.

1863. *Glossula.* Sepals conniving in a galea: the upper without a spur. Lip anterior, spurred, 3-parted, with an inflated spur. Pollen-masses 2, 2-parted, with 2 glands inclosed in distinct pouches.

1864. *Anacamptis.* The flower of Orchis, from which it differs in having the gland of the pollen-masses single, with inflexed edges, and enclosed in a pouch.

1865. *Aceras.* Flower ringent. Lip without a spur. Glands of the pollen-masses included in a common pouch.

1866. *Ophrys.* Flower somewhat spreading. Lip without a spur. Glands of the pollen-masses inclosed in two distinct pouches.

1867. *Chamorchis.* Ovary reclinate at end. Flower galeate. Lip without a spur, undivided. Glands of the pollen-masses naked. Upper lip of stigma divided. Anther of Orchis.

1868. *Herminium.* Flower somewhat spreading. Lip without a spur. Glands of the pollen-masses naked, distinct.

1869. *Serapias.* Flower ringent. Lip without a spur. Column sharp-pointed. Pollen-masses attached to a single gland inclosed in one pouch.

§ 2. *Anther parallel with stigma. Pollen powdery.*

1870. *Goodyera.* Cor. ringent, with the 2 exterior or lateral segments of the perianth placed beneath the lip, which is gibbous at the base and undivided at the extremity. Column free. Pollen angular.

1871. *Diuris.* Flower irregular. Two outer linear sepals placed beneath the trifid lip: the inner clawed and spreading. Column with the lateral lobes petaloid. Pollen farinaceous.

1872. *Ponthieva.* Flower irregular. Lip behind, with the inner sepals inserted in the column. Pollen farinaceous.

1873. *Neottia.* Flowers connivent. Lip sessile, 2-lobed, with no calli. Anther terminal, sessile. Stigma 2-lipped pervious; the front lip thickened.

1874. *Spiranthes.* Spike spiral. Ovary oblique at the end. Sepals connivent. Lip clawed, parallel with columna, with 2 calli at the base, entire. Anther terminal stalked. Stigma flat, cuspidate, membranous, finally split.

1875. *Stenorhynchus.* Like the last; but the lip adheres to the columna by means of the margins of its lateral lobes: it has no callosities. Stigma corneous, always entire.

1876. *Listera.* Flowers connivent. Lip 2-lobed, sessile, with no calli. Anther intramarginal, half covered over by the hooded clinandrium. Stigma closed, nearly flat, with a strong transverse furrow.

§ 3. *Anther terminal, persistent. Pollen powdery.*

1877. *Arethusa.* Lip united at base with the columna, at the end hooded, in the inside crested. Sepals 5, united at base. Pollen angular.

1878. *Calopogon.* Lip at the back clawed, with a bearded inside. Sepals 5, distinct. Column separate. Pollen angular.

1879. *Pogonia.* Lip sessile, hooded, crested inside. Sepals 5, distinct, without glands. Pollen farinaceous.

1880. *Epipactis.* Lip ventricose below; the extremity either undivided or 3-lobed: the middle lobe the largest, connected as it were by a joint. Pollen farinaceous.

1881. *Caleana.* Lip unguiculate, placed at the back, with a peltate hollow lamina, having a perforation on the outside. Pollen farinaceous.

1882. *Corallorhiza.* Lip produced behind, adnate with the spur or free. Column free. Masses of pollen 4, oblique, not parallel.

§ 4. *Anther terminal, opercular deciduous. Pollen waxy.*

1883. *Rodriguezia.* Perianth. 4-leaved ringent. Lip entire, unguiculate cornute at base; callous in the middle. Pollen-masses 2, with an elastic caudicula. Stigma with 2 horns.

1884. *Gomeza.* Like the last, but lip not cornute at base.

1885. *Cymbidium.* Lip not spurred, concave, jointed with the simple base of the columna. Sepals spreading, distinct. Pollen masses 2, 2-lobed behind.

1885. *Brassia.* Lip expanded, undivided. Sepals spreading, distinct. Column not winged. Pollen-masses 2, 2-lobed behind; fixed by the middle to a common process of the stigma.

1887. *Lissochilus.* Pollen-masses 2, obliquely 2-lobed. Lip saccate at base, sessile, undivided, convex at the base, united with the apterous toothless column. Inner sepals divaricating, petaloid; outer reflexed, calycine.

1888. *Geodorum.* Lip cucullate-ventricose, sometimes spurred at base, sessile, not jointed with the column. Sepals like the lip, 1-sided. Pollen-masses 2, lobed at back.

1889. *Catasetum.* Perianth. not inverted, generally globose. Lip saccate, concave, different from the sepals. Pollen-masses 2, 2-lobed behind, inserted on a large naked transverse caudicula, which finally separates with elasticity.

1890. *Trizeuxis.* Perianth. 2-parted; upper segment 2-lobed; lower 3-parted, inflated. Lip parallel with column, with a recurved dilated limb. Stigma excavated. Anther 1-celled, fleshy. Pollen-masses 2, adhering to a fusiform caudicula.

1891. *Xylobium.* Perianth. spreading. Lip behind jointed, with an unguiform process of the column, 3-lobed, incumbent on columna. Outer lateral sepals united by their bases, with the process of column. Pollen-masses 2, furrowed on one side, seated on a broad caudicula.

1892. *Maxillaria.* Perianth. spreading. Lip in front 3-lobed, jointed with the unguiform process of the column. Lateral outer sepals united by their bases with the process of column. Pollen-masses 2, bipartite, united by their bases to a common gland.

1893. *Notylia.* Perianth. 4-leaved: upper sepals spreading. Lip divaricating entire. Columna acuminate. Pollen-masses 2, entire. Anther posterior, not terminal.

1894. *Pleurothallis.* Lip jointed with the simple or slightly lengthened base of column. The two anterior sepals united at base. Pollen-masses 2, not furrowed.

1895. *Oncidium.* Lip expanded, lobed, tubercled at base. Petals spreading, sometimes only 4. Column winged. Pollen-masses 2, 2-lobed behind, fixed by the middle to the common process of the stigma.

1896. *Cyrtopodium.* Sepals 5, distinct. Lip 3-lobed, connected with a joint with the unguiform process of the base of the apterous column. Pollen-masses 2, 2-lobed behind.

1897. *Cœlogyne.* Perianth. resupinate, spreading. Lip 3-lobed, cucullate, jointed with columna. Column winged. Anther lateral, 2-celled. Pollen-masses 2, 2-parted. Stigma funnel-shaped, 2-lipped.

1898. *Macradenia.* Lip sessile, cucullate, concave, undivided, acuminate. Sepals distinct, spreading. Column distinct, with the lobes of its end conniving. Pollen-masses 2, unfurrowed, seated on a long filiform caudicula.

1899. *Dendrobium.* Lip without a spur, jointed with the unguiform process of the column, to whose edges the anterior sepals adhere. Pollen-masses 4, parallel.

1900. *Anisopetalum.* Flowers erect. Sepals conniving. The two lateral exterior large, cohering at end: two inner very small subulate. Lip oblong, with 2 teeth near the base. Pollen-masses 4, without gland or caudicula.

1901. *Camaridium.* Perianth. resupinate, expanded. Sepals distinct. Lip distinct, sessile, cucullate, 3-lobed. Column round. Stigma arched. Pollen-masses 4, parallel, compressed, without a caudicula at the time of expansion.

1902. *Ornithidium.* Lip sessile, hooded, connate with the base of column. Sepals conniving. Pollen-masses 4, oblique, furrowed at base.

1903. *Isochilus.* Lip almost of the same shape as the distinct, connivent, sepals. Pollen-masses 4, parallel.

1904. *Pholidota.* Flowers resupinate. Sepals uniform; the three outer erect, keeled at back. Lip ventricose. Column dilated at end. Anther 2-celled. Pollen masses 4, each pair having a gland.

1905. *Broughtonia.* Column distinct, or at the very base united with the unguiculate lip, which is lengthened at the base into a tube, connate with the ovarium. Pollen-masses 4, parallel, with a granular caudicula reflexed npon the masses.

1906. *Cattleya.* Sepals spreading. Lip sessile, cucullate, surrounding the half round column. Pollen-masses 4, with as many powdery reflexed caudiculæ.

1907. *Epidendrum.* Column united with the claw of the lip, and forming a tube which sometimes runs down the ovarium. Pollen-masses 4, with as many powdery reflexed caudiculæ.
